Cotes, Roger (1682–1716), English mathematician and philosopher, was born on the 10th of July 1682 at Burbage, Leicestershire, of which place his father, the Rev. Robert Cotes, was rector. He was educated at Leicester school, and afterward at St Paul's school, London. Proceeding to Trinity College, Cambridge, in 1699, he obtained a fellowship in 1703, and in the following year was appointed Plumian professor of astronomy and experimental philosophy in the university of Cambridge. He took orders in 1713; and the same year, at the request of Dr Richard Bentley, he published the second edition of Newton's Principia with an original preface. He died on the 3rd of June 1716, leaving unfinished a series of elaborate researches on optics, and leaving a large amount of unpublished manuscript. He contributed two memoirs to the Philosophical Transactions, one, "Logometria," which discusses the calculation of logarithms and certain applications of the infinitesimal calculus, the other, a "Description of the great fiery meteor seen on March 6th, 1716." After his death his papers were collected and published by his cousin and successor in the Plumian chair, Dr Robert Smith, under the title Harmonia Mensuratarum (1722). This work included the "Logometria," the trigonometrical theorem known as "Cotes' Theorem on the Circle" (see TRIGONOMETRY), his theorem on harmonic means, subsequently developed by Colin Maclaurin, and a discussion of the curves known as "Cotes' Spirals," which occur as the path of a particle described under the influence of a central force varying inversely as the cube of the distance. In 1738 Dr Robert Smith published Cotes' Hydrostatical and Pneumatical Lectures, a work which was held in great estimation. The exceptional genius of Cotes earned encomiums from both his contemporaries and successors; Sir Isaac Newton said, "If Mr Cotes had lived, we should have known something."

Côtes-du-Nord, a maritime department of the north-west of France, formed in 1790 from the northern part of the province of Brittany, and bounded N. by the English Channel, E. by the department of Ille-et-Vilaine, S. by Morbihan, and W. by Finistère. Pop. (1906) 611,506. Area, 2786 sq. m. In general conformation, Côtes-du-Nord is an undulating plateau including in its more southerly portion three well-marked ranges of hills. A granitic chain, the Monts du Méné, starting in the south-east of the department runs in a north-westerly direction, forming the watershed between the rivers running respectively to the Channel and the Atlantic Ocean. Towards its western extremity this chain bifurcates to form the Montagnes Noires in the south-west and the Montagne d'Arrée in the west of the department. The rivers of the Channel slope are the Rance, Arguenon, Gouessan, Gouet, Trieux, Tréguer and Léguer, while the Blavet, Meu, Oust and Aulne belong to the southern slope. Off the coast, which is steep, rocky and much indented, are the Sept-Îles, Bornéol and Îles d'Heligoland. The principal bays are those of St Malo and St Brieuc.

The climate is mild and not subject to extremes; in the west it is especially humid. Agriculture is more successful on the coast, where seaweed can be used as a fertilizer, than in the interior. Cereals are largely grown, wheat, oats and buck-wheat being the chief crops. Potatoes, flax, mangels, apples, plums, cherries and honey are also produced. Pasture and various kinds of forage are abundant, and there is a large output of milk and butter. The horses of the department are in repute. It produces slate, building-stone, lime and china-clay. Flour-mills, saw-mills, sardine factories, tanneries, iron-works, manufactories of polish, boat-building yards, and rope-works employ many of the inhabitants, and cloth, agricultural implements and nails are manufactured. The chief imports are coal, wood and salt. Exports include agricultural products (eggs, butter, vegetables, &c.), horses, flax and fish. The chief commercial ports are Le Légué and Paimpol; and Paimpol also equips a large fleet for Le Islandic fisheries. The coast fishing is important and large quantities of sardines are preserved. The department is served by the Ouest-Itat railway; its chief waterway is the canal from Nantes to Brest which traverses it for 73 m.

Côtes-du-Nord is divided into the five arrondissements of St Brieuc, Dinan, Guingamp, Lannion and Loidac, which contain 48 cantons and 350 communes. Bas Breton is spoken in the arrondissements of Guingamp and Lannion, and in part of those of Loidac and St Brieuc. The department belongs to the ecclesiastical province, the académie (educational division), and the appeal court of Rennes, and in the region of the X. army corps. St Brieuc, Dinan, Guingamp, Lamballe, Paimpol and Tréguier, the more noteworthy towns, are separately treated. Extensive remains of an abbey of the Premonstratensian order, dating chiefly from the 13th century, exist at Kerity; and Lehon has remains of a priory, which dates from the same period. The department is rich in interesting churches, among which those of Ploubezre (12th, 14th and 16th centuries), Perros-Guirec (12th century), Plesitius-les-Grèves (16th century) and Léglise (14th century) may be mentioned. The church of St Mathurin at Montconour, which is a celebrated place of pilgrimage, contains fine stained glass of the 16th century, and the mural paintings of the chapel of Kermaria-an-Isguit near Plouha, which belongs to the 13th and 14th centuries, are celebrated. Near Lannion (pop. 5336), itself a picturesque old town, is the ruined castle of Tonquédec, built in the 14th century and sometimes known as "the Pierrefonds of Brittany," owing to its resemblance to the more famous castle. At Corseul are a temple and other Roman remains.

Cotgrave, Randel (?–1634), English lexicographer, came of a Cheshire family, and was educated at Cambridge, entering St John's College in 1587. He became secretary to Lord Burghley, and in 1611 published his French-English dictionary (2nd ed., 1652), a work of real historical importance in lexicography, and still valuable in spite of such errors as were due to contemporary want of exact scholarship.

Cöthen, or Köthen, is a town of Germany, in the duchy of Anhalt on the Ziehe, at the junction of several railway lines, 42 m. N.W. of Leipzig by rail. Pop. (1905) 27,978. It consists of an old and a new town with four suburbs. The former palace of the dukes of Anhalt-Cöthen, in the old town, has fine gardens and contains collections of pictures and coins, the famous ornithological collection of Johann Friedrich Naumann (1780–1857), and a library of some 20,000 volumes. Of the churches the Lutheran Jakobskirche (called the cathedral), a Gothic building with some fine old stained glass, is noteworthy. Besides the usual classical and modern schools (Gymnasium and Realschule) Cöthen possesses a technical institute, a school of gardening and a school of forestry. The industries include iron-founding and the manufacture of agricultural and other machinery, malt, beet-root sugar, leather, spirits, &c.; a tolerably active trade is carried on in grain, wool, potatoes and vegetables. Among others, there is a monument to Sebastian Bach, who was music director here from 1717 to 1723.

According to legend, Cöthen was a Slav settlement, which was captured and destroyed by the German king Henry I. In 927.

By the 12th century it had secured town rights and become a considerable centre of trade in agricultural produce. In 1300 it was burned by the margrave of Meissen. In 1547 the town was taken from its prince, Wolfgang (a cadet of the house of Anhalt), who had joined the league of Schmalkalden, and given by the emperor Charles V., with the rest of the prince's possessions, to the Spanish general and painter, Felipe Ladrón y Guevara.
COTMAN—

It is bordered by a rim of trachytic rock, forming a black coronet above the greyish volcanic dust and sand which covers its sides to a great depth. Whymper found snow and ice under this sand. On the southern slope, at a height of 15,050 ft., is a bare cone of porphyritic andesite called El Pichaco, "the beak," or Cabeza del Inca, "the Inca's head," with dark cliffs rising fully 1000 ft., which according to tradition is the original summit of the volcano blown off at the first-known eruption of 1532. The summit of Cotopaxi is usually enveloped in clouds; and even in the clearest month of the year it is rarely visible for more than eight or ten days. Its eruptions produce enormous quantities of pumice, and deep layers of mud, volcanic sand and pumice surround it on the plateau. Of the air currents about and above Cotopaxi, Wagner says (Naturw. Reisen im trop. Amerika, p. 514): "On the Tacunga Plateau, at a height of 8000 French feet, the prevailing direction of the wind is meridional, usually from the south in the morning, and frequently from the north in the evening; but over the summit of Cotopaxi, at a height of 18,000 ft., the north-west wind always prevails throughout the day. The gradually-widening volcanic cloud continually takes a south-eastern direction over the rim of the crater; at any rate, however, of about 21,000 ft. it suddenly turns to the north-west, and maintains that direction till it reaches a height of at least 28,000 ft. There are thus from the foot of the volcano to the highest level attained by its smoke-cloud three quite distinct regular currents of wind."

COTRONE (anc. Croto, Cretona), a seaport and episcopal see on the E. coast of Calabria, Italy, in the province of Catanzaro, 37 m. E.N.E. of Catanzaro Marina by rail, 143 ft. above sea-level. Pop. (1901) town, 7917; commune, 9954. It has a castle erected by the emperor Charles V. and a small harbour, which, even in ancient times was not good, but important as the only one between Taranto and Reggio. It exports a considerable quantity of oranges, olives and liqueur.

COTTA, the name of a family of German publishers, intimately connected with the history of German literature. The Cottas were of noble Italian descent, and at the time of the Reformation the family was settled in Eisenach in Thuringia.

Johann Georg Cotta (1) (1631-1692), the founder of the publishing house of J. G. Cotta, married in 1659 the widow of the university bookseller, Philipp Braun, in Tübingen, and took over the management of his business, thus establishing the firm which was subsequently associated with Cotta's name. On his death, in 1692, the undertaking passed to his only son, Johann Georg (2); and on his death in 1712, to the latter's eldest son, also named Johann Georg (3), while the second son, Johann Friedrich (see below), became the distinguished theologian.

Although the eldest son of Johann Georg (3), Christoph Friedrich Cotta (1730-1807), established a printing-house in the court at Stuttgart, the business languished, and it was reserved to his youngest son, Johann Friedrich, Freiherr Cotta von Cottendorf (1764-1832), who was born at Stuttgart on the 27th of April 1764, to restore the fortunes of the firm. He attended the gymnasium of his native place, and was originally intended for the study of theology, but, however, entered the university of Tübingen as a student of mathematics and law, and after graduating spent a considerable time in Paris, studying French and natural science, and mixing with distinguished literary men. After practising as an advocate in one of the higher courts, Cotta, in compliance with his father's earnest desire, took over the publishing business at Tübingen. He began in December 1787, and laboured incessantly to acquire familiarity with all the details. The house connections rapidly extended; and, in 1794, the Allgemeine Zeitung, of which Schiller was to be editor, was planned. Schiller was compelled to withdraw on account of his health; but his friendship with Cotta deepened every year, and was a great advantage to the poet and his family. Cotta awakened in Schiller so warm an attachment that, as Heinrich Döring tells us in his life of Schiller (1824), when a bookseller offered him a higher price than Cotta for the copyright of Wallenstein, the poet firmly declined it, replying "Cotta deals honestly with me, and I with him." In 1795 Schiller and Cotta founded

(1510-1563), from whom it was, however, soon repurchased. Hahnemann, the founder of homoeopathy, lived and worked in Cottenberg. From 1603 to 1847 Cöthen was the capital of the principality, later duchy, of Anhalt-Cöthen.

COTMAN, JOHN SELL (1782-1842), English landscape-painter and etcher, son of a well-to-do silk mercer, was born at Norwich on the 16th of May 1782. He showed a talent for art and was sent to London to study, where he became the friend of Turner, T. Girtin and other artists. He first exhibited at the Royal Academy in 1800. In 1807 he went back to Norwich and joined the Norwich Society of Artists, of which in 1811 he became president. In 1825 he was made an associate of the Society of Painters in Water-colours; in 1834 he was appointed drawing-master at King's College, London; and in 1836 he was elected a member of the Institute of British Architects. He died in London on the 24th of July 1842. Cotman's work was not considered of much importance in his own day, and his pictures only procured small prices; but he now ranks as one of the great figures of the Norwich school. He was a fine draughtsman, and a remarkable painter both in oil and water-colour. One of his paintings is in the National Gallery. His fine architectural etchings, published in a series of volumes, the result of tours in Norfolk and Normandy, are valuable records of his interest in archaeology. He married early in life, and had five children, his sons, Miles Edmund (1810-1858) and Joseph John (1814-1878), both becoming landscape-painters of merit; and his younger brother Henry's son, Frederic George Cotman (b. 1850), the water-colour artist, continued the family reputation.

COTONEASTER, a genus of the rose family (Rosaceae), containing about twenty species of shrubs and small trees, natives of Europe, North Africa and temperate Asia. C. vulgaris is native on the limestone cliffs of the Great Orme in North Wales. Several species are grown in shrubberies and borders, or as wall plants, mainly for their clusters of bright red or yellow berry-like fruits. Plants are easily raised by seeds, cuttings or layers, and grow well in ordinary soil.

COTOPAXI, a mountain of the Andes, in Ecuador, South America, 35 m. S.S.E. of Quito, remarkable as the loftiest active volcano in the world. The earliest outbursts on record took place in 1532 and 1533; and since then the eruptions have been both numerous and destructive. Among the most important are those of 1744, 1746, 1766, 1768 and 1803. In 1744 the thunderings of the volcano were heard at Honda on the Rio Magdalena, about 900 m. distant; in 1768 the quantity of ashes ejected was so great that it covered all the lesser vegetation as far as Riobamba; and in 1803 Humboldt reports that at the port of Guayaquil, 160 m. from the crater, he heard the noise day and night like continued discharges of a battery. There were considerable outbursts in 1851, 1855, 1856, 1864 and 1877. In 1802 Humboldt made a vain attempt to scale the cone, and pronounced the enterprise impossible; and the failure of Jean Baptiste Bousingsault in 1831, and the double failure of M. Wagner in 1856, seemed to confirm his opinion. In 1872, however, Dr. Wallenius climbed on the 24th and 28th of November in reaching the top; in the May of the following year the same feat was accomplished by Dr. A. Stübel, and he was followed by T. Wolf in 1877, M. von Thielmann in 1878 and Edward Whymper in 1880. Cotopaxi is frequently described as one of the most beautiful mountain masses of the world, rivalling the celebrated Fujiyama of Japan in its symmetry of outline, but overlapping it by more than 7000 ft. It is more than 15,000 ft. higher than Vesuvius, over 7000 ft. higher than Tenerife, and nearly 2000 ft. higher than Popocatepetl. Its slope, according to Orton, is 30°, according to Wagner 29°, the north-western side being slightly steeper than the south-eastern. The apical angle is 122°-30°. The snowfield is heavier on the eastern side of the cone which is permanently covered, while the western side is usually left bare, a phenomenon occasioned by the action of the moist trade winds from the Atlantic. Its height according to Whymper is 19,613 ft., and its crater is 2300 ft. in diameter from N. to S., 1650 ft. from E. to W., and has an approximate depth of 1200 ft.
the *Horen*, a periodical very important to the student of German literature. The poet intended, by means of this work, to infuse higher ideas into the common life of men, by giving them a nobler human culture, and to reunite the divided political world under the banner of truth and beauty." The *Horen* brought Goethe and Schiller into intimate relations with each other and with Cotta; and Goethe, while regretting that he had already promised Wilhelm Meister to another publisher, contributed the *Unterrichtung deutscher Ausgewanderten*, the *Rollen Elegies* and a paper on Literary Sansculottism. Fichte sent essays from the first, and the other brilliant German authors of the time were also represented. In 1798 the *Allgemeine Zeitung* appeared at Tübingen, being edited first by Posselt and then by Huber. Soon the editorial office of the newspaper was transferred to Stuttgart, in 1803 to Ulm, and in 1810 to Augsburg; it is now in Munich. In 1799 Cotta entered on his political career, being sent to Paris by the Württemberg estates as their representative. Here he made friendships which proved very advantageous for the *Allgemeine Zeitung*. In 1801 he paid another visit to Paris, also in a political capacity, when he carefully studied Napoleon's policy, and treasured up many hints which were useful to him in his literary undertakings. He still, however, devoted most of his attention to his own business, and, for many years, endeavoured to place the ledger system on a sound basis. He introduced the tedium of almost ceaseless toil by pleasant intercourse with literary men. With Schiller, Huber, and Gottlieb Konrad Pfeffel (1736–1809) he was on terms of the warmest friendship; and he was also intimate with Herder, Schelling, Fichte, Richter, Voss, Hebel, Tieck, Therese Huber, Matthiassen, the brothers Humboldt, Johann Müller, Spittler and others, whose works he published in whole or in part. In the correspondence of Alexander von Humboldt with Varnhagen von Ense we see the familiar relations in which the former stood to the Cotta family. In 1795 he published the *Politischen Annalen* and the *Jahrbücher der Baukunde*, and in 1798 the *Domainsalmanach*, along with some works of less importance. In 1807 he issued the *Morgenblatt*, to which Schorn's *Kunstblatt* and Menzel's *Literaturblatt* were afterwards added. In 1810 he removed to Stuttgart; and from that time till his death he was loaded with honours. State affairs and an honourable commission from the German bookellers took him to the Vienna congress; and in 1825 he was deputy-elect at the Württemberg diet. In 1819 he became representative of the nobility; then he was elected to the council of state, and (1824) became president of the Württemberg second chamber. He was also appointed Prussian Geheimrat, and knight of the order of the Württemberg crown; King William I. of Württemberg having already revived the ancient nobility in his family by granting him the patent of Freiherr (Baron) Cotta von Cottendorf. Meanwhile such publications as the *Polytechnische Journal*, the *Hesperus*, the *Württembergische Jahrhücker*, the *Hertha*, the *Austland*, and the *Inland* issued from the press. In 1828–1829 appeared the famous correspondence between Schiller and Goethe. Cotta was an unflagging friend of young struggling men of talent. In addition to his high standing as a publisher, he was a man of great practical energy, which flowed into various fields of activity. He was a scientific agriculturist, and promoted many reforms in farming. He was the first Württemberg landholder to abolish servitude on his estates. In politics he was throughout his life a moderate liberal. In 1824 he set up a steam printing press in Augsburg, and, about the same time, founded a literary institute at Munich. In 1825 he started steamboats, for the first time, on Lake Constance, and introduced them in the following year on the Rhine. In 1828 he transferred his firm to Berlin on an important commission, by Bavaria and Württemberg, and there renewed with orders of distinction at the hands of the three kings. He died on the 20th of December 1832 leaving a son and a daughter as coheirs.

His son, Johann Georg (4), Freiherr Cotta von Cotten- dorf (1796–1863), succeeded to the management of the business on the death of his father, and was materially assisted by his sister's husband, Freiherr Hermann von Reischach. He greatly extended the connexions of the firm by the purchase, in 1839, of the publishing business of G. J. Göschen in Leipzig, and in 1845 of that of Vogel in Landshut; while, in 1845, "Bible" branches were established at Stuttgart and Munich. He was succeeded by his younger son, Karl, and by his nephew (the son of his sister), Hermann Albert von Reischach. Under their joint partnership, the before-mentioned firms in Leipzig and Landshut, and an artistic establishment in Munich passed into other hands, leaving on the death of Hermann Albert von Reischach, in 1876, Karl von Cotta the sole representative of the firm, until his death in 1888. In 1889 the firm of J. G. Cotta passed by purchase into the hands of Adolf and Paul Kröner, who took others into partnership. In 1890 the business was converted into a limited liability company.

**JOHANN FRIEDRICH COTTA** (1701–1779), the theologian, was born on the 12th of March 1701, the son of Johann Georg Cotta (2). After studying theology at Tübingen he began his public career as lecturer in Jena University. He then travelled in Germany, France and Holland, and, after residing several years in London, became professor at Tübingen in 1733. In 1736 he removed to the chair of theology in the university of Göttingen, which had been instituted as a seat of learning, two years before, by George II. of England, in his capacity as elector of Hanover. In 1739, however, he returned, as extraordinary professor of theology, to his Alma Mater, and, after successively filling the chairs of history, poetry and oratory, was appointed ordinary professor of theology in 1741. Finally he died, as chancellor of Tübingen University, on the 31st of December 1779. His learning was at once wide and accurate; his theological views were orthodox, although he did not believe in strict verbal inspiration. He was a voluminous writer. His chief works are his edition of Johann Gerhard's *LocI Theologici* (1762–1777), and the *Flusscheneke* (1769–1772).

**COTTA, BERNHARD VON** (1808–1879), German geologist, was born in a forester's lodge near Eisenach, on the 24th of October 1808. He was educated at Freiberg and Heidelberg, and from 1842 to 1854 he held the professorship of geology in the Bergakademie of Freiberg. Botany at first attracted him, and he was one of the earliest to use the microscope in determining the structure of fossil plants. Later on he gave his attention to practical geology, to the study of ore-deposits, of rocks and metamorphism; and he was regarded as an excellent teacher. His *Rocks classified and described: a Treatise on Lithology* (translated by P. H. Lawrence, 1866) was the first comprehensive work on the subject issued in the English language, and it gave great impetus to the study of rocks in Britain. He died at Freiberg on the 14th of September 1879.

**COTTA, RAULIUS AURELIUS (c. 124–73 B.C.), Roman statesman and orator.** In 92 he defended his uncle P. Rutilius Rufus, who had been unjustly accused of extortion in Asia. He was on intimate terms with the tribune M. Livius Drusus, who was murdered in 91, and in the same year was an unsuccessful candidate for the tribunate. Shortly afterwards he was prosecuted under the *lex Varia*, directed against all who had in any way supported the Italians against Rome, and, in order to avoid condemnation, went into voluntary exile. He did not return till 82, during the dictatorship of Sulla. In 75 he was consul, and, elapsed the hostility of the optimates by carrying a law that abolished the Sullan disqualification of the tribunes from holding higher magistracies; another law *de judiciis privatis*, of which nothing is known, was abrogated by his brother. In 74 Cotta obtained the province of Gaul, and was granted a triumph for some victory of which we possess no details; but on the very day before its celebration an old wound broke out, and he died suddenly. According to Cicero, P. Sulpicius Rufus and Cotta were the best speakers of the young men of their time. Physically incapable of rising to passionate heights of oratory, Cotta's
successes were chiefly due to his searching investigation of facts; he kept strictly to the essentials of the case and avoided all irrelevant digressions. His style was pure and simple. He is introduced by Cicero as an interlocutor in the De oratore and De natura deorum (iii.), as a supporter of the principles of the New Academy. The fragments of Sallust contain the substance of a speech delivered by Cotta in order to calm the popular anger at a deficient corn-supply.

See Cicero, De oratore, iii. 3; Brutus, 49, 55, 90, 92; Sallust, Hist. Frag.; Appian, Bell. Civ. i. 37.

His brother, Lucius Aurelius Cotta, when praetor in 70 B.C. brought in a law for the reform of the jury lists, by which the judges were to be eligible, not from the senators exclusively as limited by Sulla, but from senators, equites and tribuni aerarii. Three were to be senators, and two-thirds of men of equestrian census, one-half of whom must have been tribuni aerarii, a body as to whose functions there is no certain evidence, although in Cicero's time they were reckoned by courtesy amongst the equites. In 66 Cotta and L. Manlius Torquatus accused the consuls-elect for the following year of bribery in connexion with the elections; they were condemned, and Cotta and Torquatus chosen in their places. After the suppression of the Catilinarian conspiracy, Cotta proposed a public thanksgiving for Cicero's services, and after the latter had gone into exile, supported the view that there was no need to notice this rogue, since the law of Cicero was wholly worthless. He subsequently attacked himself, as Caesar, and it was currently reported that Cotta (who was then quindecinvir) intended to propose that Caesar should receive the title of king, it being written in the books of fate that the Parthians could only be defeated by a king. Cotta's intention was not carried out in consequence of the murder of Caesar, after which he retired from public life.

See Cicero, Orat. i. Onomasticon; Sallust, Catilina, 18; Suetonius, Caesar, 79; Livy, Epit. 97; Vell. Pat. ii. 32; Dio Cassius xxxvi. 44. xxxvii. 1.

COTTABUS (Gr. κότταβος), a game of skill for a long time in great vogue at ancient Greek drinking parties, especially in the 4th and 5th centuries B.C. It is frequently alluded to by the classical writers of the period, and not uncommonly depicted on vases. The object of the player was to cast a portion of wine left in his drinking cup in such a way that, without breaking bulk in its passage through the air, it should reach a certain object set up as a mark, and there produce a distinct noise by its impact. Both the wine thrown and the noise made were called λαχάς. The thrower, in the ordinary form of the game, was expected to retain the recumbent position that was usual at table, and, in flinging the cottabus, to make use of his right hand only. To succeed in the aim no small amount of dexterity was required, and unusual ability in the game was rated as high as corresponding excellence in throwing the javelin. Not only was the cottabus the ordinary companion of the festal assembly, but at least in Sicily a special bundle of a circular form was sometimes erected so that the players might be easily arranged round the basin, and follow each other in rapid succession. Like all games in which the element of chance found a place, it was regarded as more or less ominous of the future success of the players, especially in matters of love; and the excitement was sometimes further augmented by some object of value being stacked on the various bodies, or by the entirely goods of the game being gradually recalled, but for practical purposes we may reckon two varieties. (1) In the Kottabos ὄλος ἀνυψώσας shallow saucers (ἀνυψώσας) were floated in a basin or mixing-bowl filled with water: the object was to sink the saucers by throwing the wine into them, and the competitor who sank the greatest number was considered victorious, and received the prize, which consisted of cakes or sweetmeats. (2) Kottabos κατακόρως, is not so easy to understand, although there is little doubt as to the apparatus. This consisted of a ἀρβαός or bronze rod; a κάτακορα, a small disk or basin, resembling a scale-pan; a larger disk (Ἀεαδίς); and (in most cases) a small bronze figure called μύρπιτι. The discovery (by Professor Helbig in 1886) of two sets of actual apparatus near Perugia, and various representations on vases help to elucidate the somewhat obscure accounts of the method of playing the game contained in the scholia and certain ancient authors who, it must not be forgotten, wrote at a time when the game itself had become obsolete, and cannot therefore be looked to for a trustworthy description of it.

The first specimen of the apparatus found at Perugia resembles a candelabrum on a base, tapering towards the top, with a blunted end, on which the small disk (found near the rod), which has a hole near the edge and is slightly hollow in the middle, could be balanced. At about a third of the height of the rod is a large disk with a hole in the centre through which the rod runs; in a socket at the top is a small bronze figure, with right arm and right leg uplifted. In the second specimen there is no large disk, and the figure is holding up what is apparently a rhyton or drinking-horn.

According to Prof. Helbig in Mittheilungen des deutschen archäologischen Instituts (Römische Abtheilung 1, 1886) three games were played with this apparatus. In the first the smaller disk was placed at the base and the object was to fling the disk, a large disk with a hole in the centre through which the rod runs; in a socket at the top is a small bronze figure, with right arm and right leg uplifted. In the second specimen there is no large disk, and the figure is holding up what is apparently a rhyton or drinking-horn.

In the second specimen there is no large disk, and the figure is holding up what is apparently a rhyton or drinking-horn.

The discovery (by Professor Helbig in 1886) of two sets of actual apparatus near Perugia, and various representations on vases help to elucidate the somewhat obscure accounts of the method of playing the game contained in the scholia and certain ancient authors who, it must not be forgotten, wrote at a time when the game itself had become obsolete, and cannot therefore be looked to for a trustworthy description of it.

The discovery (by Professor Helbig in 1886) of two sets of actual apparatus near Perugia, and various representations on vases help to elucidate the somewhat obscure accounts of the method of playing the game contained in the scholia and certain ancient authors who, it must not be forgotten, wrote at a time when the game itself had become obsolete, and cannot therefore be looked to for a trustworthy description of it.

The first specimen of the apparatus found at Perugia resembles a candelabrum on a base, tapering towards the top, with a blunted end, on which the small disk (found near the rod), which has a hole near the edge and is slightly hollow in the middle, could be balanced. At about a third of the height of the rod is a large disk with a hole in the centre through which the rod runs; in a socket at the top is a small bronze figure, with right arm and right leg uplifted. In the second specimen there is no large disk, and the figure is holding up what is apparently a rhyton or drinking-horn.

According to Prof. Helbig in Mittheilungen des deutschen archäologischen Instituts (Römische Abtheilung 1, 1886) three games were played with this apparatus. In the first the smaller disk was placed at the base and the object was to fling the disk, a large disk with a hole in the centre through which the rod runs; in a socket at the top is a small bronze figure, with right arm and right leg uplifted. In the second specimen there is no large disk, and the figure is holding up what is apparently a rhyton or drinking-horn.

COTTER—COTTIN

Cambridge, Pepys was called to the bar at Lincoln's Inn in 1804. Practising at the chancery bar, his progress was extremely slow, and it was not till twenty-two years after his call that he was made a king's counsel. He sat in parliament, successively, for High Sommers and Malton, was appointed solicitor-general in 1874, and in the same year became master of the rolls. On the formation of Lord Melbourne's second administration in April 1835, the great seal was for a time in commission, but eventually Pepys, who had been one of the commissioners, was appointed lord chancellor (January 1836) with the title of Baron Cottenham. He held office until the defeat of the ministry in 1841. In 1846 he again became lord chancellor in Lord John Russell's administration. His health, however, had been gradually failing, and he resigned in 1850. Shortly before his retirement he had been created Viscount Crowhurst and earl of Cottenham. He died at Pietra Santa, in the duchy of Lucca, on the 29th of April 1871.

As both a lawyer and as a judge, Lord Cottenham was remarkable for his mastery of the principles of equity. An indifferent speaker, he nevertheless adorned the bench by the soundness of his law and the excellence of his judgments. As a politician he was somewhat of a failure, while his only important contribution to the statute-book was the Judgments Act 1838, which amended the law for the relief of insolvent debtors.

The title of earl of Cottenham descended in turn to two of the earl's sons, Charles Edward (1824-1863), and William John (1825-1881), and then to the latter's son, Kenelm Charles Edward (b. 1874).  

AUTHORITIES.—Campbell, Lives of the Lord Chancellors (1869); E. Foss, The Judges of England (1828-1864); E. Manson, Builders of Our Law (1904); J. B. Atlay, The Victorian Chancellors (1908).

COTTER, COTTAR, or COTTIER, a word derived from the Latin cotia, a cot or cottage, and used to describe a man who occupies a cottage and cultivates a small plot of land. This word is often employed to translate the cotarius of Domesday Book, a class whose exact status has been the subject of some discussion, and is still a matter of doubt. According to Domesday the cotarii were comparatively few, numbering less than seven thousand, and were scattered unevenly throughout England, being principally in the southern counties; they were occupied either in cultivating a small plot of land, or in working on the holdings of the villani. Like the villani, among whom they were frequently classed, their economic condition may be described as "free in relation to every one except their lord."

See F. W. Maitland, Domesday Book and Beyond (Cambridge, 1897); and P. Vinogradoff, Villainage in England (Oxford, 1892).

COTTESWOLD HILLS, or Cotteswolds, a range of hills in the western midlands of England. The greater part lies in Gloucestershire, but the system covered by the name also extends into Worcestershire, Warwickshire, Oxfordshire, Wiltshire and Somersetshire. It extends on a line from N.E. to S.W., forming a part of the great Oolitic belt extending through the English midlands. On the west the hills overlook the vales of Evesham, Gloucester and Berkeley (valleys of the Worcestershire Avon and the Severn), with a bold escarpment broken only by a few abrupt spurs, such as Bredon hill, between Tewkesbury and Evesham. On the east they slope more gently towards the basins of the upper Thames and the Bristol Avon. The watershed lies close to the western line, except where the Stroud valley, with the Frome, draining to the Severn, strikes deep into the heart of the hills. The principal valleys are those of the Windrush, Leach, Coin and Churn, feeders of the Thames, the Thames itself, and the Bristol Avon. The last, wherein lie Bath and Bristol, forms the southern boundary of the Cotteswolds; the northern is formed by the valleys of the Evenlode (draining to the Thames) and the Stour (to the Worcestershire Avon), with the low divide between them. The crest-line from Bath at the south to Meon Hill at the north means between 570 ft. and 590, and the breadth varies from 6 m. in the south to 28 towards the north, and the area is some 300 sq. m. The features are those of a pleasant sequestered pastoral region, rolling plateaus or wolds and bare uplands alternating with deep narrow valleys, well wooded and traversed by shallow, rapid streams. The average elevation is about 600 ft., but Cleve

Cloud above Cheltenham in the Vale of Gloucester reaches 1134 ft., and Broadway Hill, in the north, 1086 ft. These heights command splendid views over the rich vales towards the distant hills of Herefordshire and the Forest of Dean. The picturesque village of Broadway at the foot of the hill of that name is much in favour with artists.

In the soil of the hill country is so much lime that a liberal supply of manure is required. With this good crops of barley and oats are obtained, and even of wheat, if the soil is mixed with clay. But the poorest land of the hill country affords excellent pasturage for sheep, the staple commodity of the district; and the sainfon, which grows wild, yields abundantly under cultivation. The Cotteswolds have been famous for the breed of sheep named from them since the early part of the 15th century, a breed hardy and prolific, with lambs that quickly put on fleece, and become hardened to the bracing cold of the hills, where vegetation is a month later than in the vales. Improved by judicious crossing with the Leicester sheep, the modern Cotswold has attained high perfection of weight, shape, fleece and quality. An impulse was given to Cotswold farming by the chartering in 1845 of the Royal Agricultural College at Cirencester.

A number of small market-towns or large villages lie on the outskirts of the hills, but in the inner parts of the district villages are few. The "capital of the Cotteswolds" is Cirencester, in the east. In the north is Chipping Campden, its great Perpendicular church and the picturesque houses of its wide street commemorating the wealth of its wool-merchants between the 14th and 17th centuries. Near this town, in the parish of Weston-sub-Edge, Robert Dover, an attorney, founded the once famous Cotswold games early in the 17th century. Horse-racing and coursing were included with every sort of athletic exercise from quoits and skittles to wrestling, cudgels and singlestick. The games were suppressed by act of parliament in 1822.

COTTET, CHARLES (1861–), French painter, was born at Puy. He studied at the Ecole des Beaux-Arts, and under Puvic de Chavannes and Roll. He travelled and painted in Egypt, Italy, and on the Lake of Geneva, but he made his name with his sombre and gloomy, firmly designed, severe and impressive scenes of life on the Brittany coast. His signal success was achieved by his painting of the triptych, "Au pays de la mer," now at the Luxembourg museum. The Lille gallery has his "Burial in Brittany."

COTTII REGNUM, a district in the north of Liguria, including a considerable part of the important road which led over the pass (619 ft.) of the Alpids Cottia (Mont Genevre) into Gaul. Whether Hannibal crossed the Alps by this route is disputed, but it was certainly in use about 100 B.C. (See Punic Wars). In 58 B.C. Cotta crossed it with some resistance on crossing it, but seems afterwards to have entered into friendly relations with Donnus, the king of the district; he must have used it frequently, and refers to it as the shortest route. Donnus's son Cottius erected the triumphal arch at his capital Segusio, the modern Susa, in honour of Augustus. Under Nero, after the death of the last Cottius, it became a province under the title of "Alpes Cottiae," being governed by a procurator Augusti, though it still kept its old name also.

COTTIN, MARIE (called Sophie) (1770–1807), French novelist, née Ristau (not Ristaud), was born in Paris in 1770. At seventeen she married a Bordeaux banker, who died three years after, when she retired to a house in the country at Champan, where she spent the rest of her life. In 1799 she published anonymously her Claire d'Albe. Matina (1801) was also anonymous; but the success of Amélie Monsfield (1803) induced her to reveal her identity. In 1805 appeared Mathilde, an extravagant crusading story, and in 1806 she produced her last tale, the famous Elisabeth, ou les exilés de Siberie, the subject of which was treated later with an admirable simplicity by Xavier de Maistre. Sainte-Beuve asserted that she committed suicide on account of an unfortunate attachment. This story is, however,
unauthenticated. She died at Champlain (Seine et Oise) on the 25th of April 1807. A complete edition of her works, with a notice by A. Petitot, was published, in five volumes, in 1817.

COTTINGTON, FRANCIS COTTINGTON, BARON (1578-1652), English lord treasurer and ambassador, was the fourth son of Philip Cottington of Godmonston in Somersetshire. According to Hoare, his mother was Jane, daughter of Thomas Biflete, but according to Clarendon “a Stafford nearly allied to Sir Edward Stafford,” through whom he was recommended to Sir Charles Cornwallis, ambassador to Spain, becoming a member of his suite and acting as English agent on the latter’s recall, from 1609 to 1611. In 1612 he was appointed English consul at Seville. Returning to England, he was made a clerk of the council in September 1613. His Spanish experience rendered him useful to the king, and his bias in favour of Spain was always marked. He seems to have promoted the Spanish policy from the first, and pressed on Gondomar, the Spanish ambassador, the proposal for the Spanish in opposition to the French marriage for Prince Charles. He was a Roman Catholic at least at heart, becoming a member of that communion in 1623, returning to Protestantism, and again marrying himself a Roman Catholic in 1631, and supporting the cause of the Roman Catholics in England. In 1616 he went as ambassador to Spain, making in 1618 James’s proposal of mediation in the dispute with the elector palatine. After his return he was appointed secretary to the prince of Wales in October 1622, and was knighted and made a baronet in 1623. He strongly disapproved of the prince’s expedition to Spain, as an adventure likely to upset the whole policy of marriage and alliance, but was overruled and chosen to accompany him. His opposition greatly incensed Buckingham, and still more his perseverance in the Spanish policy after the failure of the expedition, and on Charles’s accession Cottington was through his means dismissed from all his employments and forbidden to appear at court. The duke’s assassination, however, enabled him to return. On the 12th of November 1628 he was made a privy councillor, and in March 1629 appointed chancellor of the exchequer. In the autumn he was again sent ambassador to Spain; he signed the treaty of peace of the 5th of November 1630, and subsequently a secret agreement arranging for the parts of Holland between Spain and England in return for the restoration of the Palatinate. On the 10th of July 1651 he was created Baron Cottington of Hanworth in Middlesex.

In March 1635 he was appointed master of the court of wards, and his exactions in this office were a principal cause of the unpopularity of the government. He was also appointed a commissioner for the treasury, together with Laud. Between Cottington and the latter there sprang up a fierce rivalry. In these personal encounters Cottington had nearly always the advantage, for he practised great reserve and possessed great powers of self-command, an extraordinary talent for dissembling and a fund of humour. Laud completely lacked these qualities, and though really possessing much greater influence with Charles, he was often embarrassed and sometimes exposed to ridicule by his opponent. The aim of Cottington’s ambition was the place of lord treasurer, but Laud finally triumphed and secured it for his own nominee, Bishop Juxon, when Cottington became “no more a leader but meddled with his particular duties only.” He continued, however, to take a large share in public business and served on the committee for Irish and Scottish affairs. In the last, appointed in July 1638, he supported the war, and in May 1640, after the dismissal of the Short Parliament, he declared it his opinion that at such a crisis the king might levy money without the Parliament. His attempts to get funds from the city were unsuccessful, and he had recourse instead to a speculation in pepper. He had been appointed constable of the Tower, and he now prepared the fortress for a siege. In the trial of Strafford in 1641 Cottington denied on oath that he had heard him use the incriminating words about “reducing this kingdom.” When the parliamentary opposition became too strong to be any longer defied, Cottington, as one of those who had chiefly incurred their hostility, hastened to retire from the administration, giving up the court of wards in May 1641 and the chancellorship of the exchequer in January 1642. He rejoined the king in 1643, took part in the proceedings of the Oxford parliament, and was made lord treasurer on the 3rd of October 1643. He signed the surrender of Oxford in July 1646, and being excepted from the indemnity retired abroad. He joined Prince Charles at the Hague in 1648, and became one of his councillors. In 1649, together with Hyde, Cottington went on a mission to Spain to obtain help for the royal cause, having an interview with Mazarin at Paris on the way. They met, however, with an extremely ill reception, and Cottington found he had completely lost his popularity at the Spanish court, one cause being his shortcomings and wavering in the matter of religion. He now announced his intention of remaining in Spain and of keeping faithful to Roman Catholicism, and took up his residence at Valladolid, where he was maintained by the Jesuits. He died there on the 10th of June 1652, his body being subsequently buried in Westminster Abbey. He had amassed a large fortune and built two magnificent houses at Hanworth and Fonthill. Cottington was evidently a man of considerable ability, but the foreign policy pursued by him was too much at variance with the temper of the times and found no toleration. According to Clarendon’s verdict he “left behind him a greater esteem of his parts than love of his person.” He married in 1623 Anne, daughter of Sir William Meredith and widow of Sir Robert Brett. All his children predeceased him, and his title became extinct at his death.

COTTON, the name of a well-known family of Anglo-Indian administrators, of whom the following are the most notable.

Sir Arthur Thomas Cotton (1803-1899), English engineer, tenth son of Henry Calveley Cotton, was born on the 15th of May 1803, and was educated at Addiscombe. He entered the Madras engineers in 1819, served in the first Burmese war (1824-26), and in 1828 began his life-work on the irrigation works of southern India. He constructed works on the Cavery, Cauvery, Godavari and Kistna rivers, making anicuts (dams) on the Coleroon (1836-38) for the irrigation of the Tanjore, Trichinopoly and South Arcot districts; and on the Godavari (1847-52) for the irrigation of the Godavari district. He also projected the anicut on the Kistna (Krishna), which was carried out by other officers. Before the beginning of his work Tanjore and the adjoining districts were threatened with ruin from lack of water; on its completion they became the richest part of Madras, and Tanjore returned the largest revenue of any district in India. He was the founder of the school of Indian hydraulic engineering, and carried out much of his work in the face of opposition and discouragement from the Madras government; though, in the minute of the 15th of May 1858, that government paid an ample tribute to the genius of Cotton’s “master mind.” He was knighted in 1861. Sir Arthur Cotton believed in the possibility of constructing a complete system of irrigation and navigation canals throughout India, and devoted the whole of a long life to the partial realization of this project. He died on the 24th of July 1890.

See Lady Hope, General Sir Arthur Cotton (1900).

Sir Henry John Steedman Cotton (1845— ), Anglo-Indian administrator, son of J. J. Cotton of the Madras Civil Service, was born on the 13th of September 1845, and was educated at Magdalen College School and King’s College, London. He entered the Bengal Civil Service in 1867, and held various appointments of increasing importance until he became chief secretary to the Bengal government (1891-96), acting home secretary to the government of India (1896), and chief commissioner of Assam (1896-92). He retired in 1902, and soon became known as the leading English champion of the Indian
nationalists. In 1906 he entered parliament as Liberal member for East Nottingham. He was the author of New India (1855; revised 1904–1907).

His brother, James Sutherland Cotton (1847– ), was born in India on the 17th of July 1847, and was educated at Magdalen College School and Trinity College, Oxford. For many years he was editor of the Academy; he published various works on Indian subjects, and was the English editor of the revised edition of the Imperial Gazetteer of India (1898).

COTTON, CHARLES (1650–1689), English poet, the translator of Montaigne, was born at Beresford in Staffordshire on the 28th of April 1650. His father, Charles Cotton, was a man of marked ability, and counted among his friends Ben Jonson, John Selden, Sir Henry Wotton and Izaak Walton. The son was apparently not sent to the university, but he had as tutor Ralph Rawson, one of the fellows ejected from Brasenose College, Oxford, in 1648. Cotton travelled in France and perhaps in Italy, and at the age of twenty-eight he succeeded to an estate greatly encumbered by lawsuits during his father's lifetime. The rest of his life was spent chiefly in country pursuits, but from his Voyage to Ireland in Burlesque (1670) we know that he held a captain's commission and was ordered to that country. His friendship with Izaak Walton began about 1653, and the fact of this intimacy seems a sufficient answer to the charges sometimes brought against Cotton's character, based chiefly on his coarse burlesques of Virgil and Lucian. Walton's initials made into a cipher with his own were placed over the door of his thatched cottage in Leicestershire and to the Compleat Angler "Instructions how to angle for a trout or salmon, or any other fish in a clear stream." He married in 1656 his cousin Isabella, who was a sister of Colonel Hutchinson. It was for his wife's sister, Miss Stanhope Hutchinson, that he undertook the translation of Corneille's Horace (1671). His wife died in 1670 and five years later he married the dowager countess of Ardglass; she had a jointure of £1500 a year, but it was secured from his extravagance, and at his death in 1687 he was insolvent.

He was buried in St James's church, Piccadilly, on the 16th of February 1687. Cotton's reputation as a burlesque writer may account for the neglect with which the rest of his poems have been treated. Their excellence was not, however, overlooked by good critics. Coleridge praises the purity and unaffectedness of his style in Biographia Literaria, and Wordsworth (Preface, 1815) gave a copious quotation from the "Ode to Winter." The "Retirement" is printed by Walton in the second part of the Compleat Angler. His masterpiece in translation, the Essays of M. de Montaigne (1655–1656, 1693, 1700, &c.), has often been reprinted, and still maintains its reputation; his other works include The Scarroonides, or Virgil Translatæ (1664–1670), a gross burlesque of the first and fourth books of the Aeneid, which ran through fifteen editions; Burlesque upon Burlesque, ... being some of Lucian's Dialogues put into English Jargon (1753); The Moral Philosophy of the Steeles (1667), from the French of Guillaume de Vair; The History of the Life of the Duke d'Espernon (1650), from the French of G. Girard; the Commentaries (1674) of Blaise de Montluc; the Planter's Manual (1673), a practical book on arboriculture, in which he was an expert; The Wonders of the Peake (1681); the Compleat Gamester and The Fair one of Tunis, both dated 1674, are also ascribed to Cotton.

William Olydys contributed a life of Cotton to Hawkins's edition (1760) of the Compleat Angler. His Lyric Poems were edited by J. R. Tunin in 1903, from an unsatisfactory edition of 1690. His translation of Montaigne was edited in 1892, and in a more elaborate form in 1902, by W. C. Hazlitt, who omitted or relegated to the notes the passages in which Cotton interpolates his own matter, and supplied his omissions.

COTTON, GEORGE EDWARD LYNCH (1813–1866), English educationist and divine, was born at Chester on the 29th of October 1813. He received his education at Westminster School and Trinity College, Cambridge. Here he joined the Low Church party, and was also the intimate friend of several disciples of Thomas Arnold, among whom were C. J. Vaughan and W. J. Conybeare. The influence of Arnold determined the character and course of his life. He graduated B.A. in 1836, and became an assistant-master at Rugby. Here he worked devotedly for fifteen years, inspired with Arnold's spirit, and heartily entered into the spirit and methods of his work, and afterwards. He had come to the fifth form about 1840 and was singularly successful with the boys. In 1852 he accepted the appointment of headmaster at Marlborough College, then in a state of almost hopeless disorganization, and in his six years of rule raised it to a high position. In 1858 Cotton was offered the see of Calcutta, which, after much hesitation about quitting Marlborough, he accepted. For its peculiar duties and responsibilities he was remarkably fitted by the simplicity and strength of his character, by his large tolerance, and by the experience which he had gained as teacher and ruler at Rugby and Marlborough. The government of India had just been transferred from the East India Company to the crown, and questions of education were eagerly discussed. Cotton gave himself energetically to the work of establishing schools for British and Eurasian children, classes which had been hitherto much neglected. He did much also to improve the position of the chaplains, and was unwearied in missionary visitation. His sudden death was widely mourned. On the 6th of October 1866 he had consecrated a cemetery at Kushtea on the Ganges, and was crossing a plank leading from the bank to the steamer when he slipped and fell into the river. He was carried away by the current and never seen again. A memoir of his life, with selections from his journals and correspondence, edited by his widow, was published in 1871.

COTTON, JOHN (1585–1652), English and American Puritan divine, sometimes called "The Patriarch of New England," was born in Derby, England, on the 4th of December 1585. He was educated at Trinity College, Cambridge, graduating B.A. in 1603 and M.A. in 1606, and became a fellow in Emmanuel College, Cambridge, then a stronghold of Puritanism, where, during the next six years, according to his friend and biographer, Rev. Samuel Whiting, he was "head lecturer and dean, and Catechist," and "a diligent tutor to many pupils." In June 1612 he became vicar of the parish church of St Botolphs in Boston, Lincolnshire, where he remained for twenty-one years and was extremely popular. Becoming more and more a Puritan in spirit, he ceased, about 1615, to observe certain ceremonies prescribed by the legally authorized ritual, and in 1632 action was begun against him in the High Commission Court. He thereupon escaped, disguised, to London, lay in concealment there for several months, and, having been deeply interested from its beginning in the colonization of New England, he eluded the watch set for him at the various English ports, and in July 1633 emigrated to the colony of Massachusetts Bay, arriving at Boston early in September. On the 23rd of October, he was elected the first of the First Church of Boston, of which John Wilson (1585–1667) was pastor, and here he remained until his death on the 23rd of December 1652. In the newer, as in the older Boston, his popularity was almost unbounded, and his influence, both in ecclesiastical and in civil affairs, was probably greater than that of any other minister in theocratic New England. According to the contemporary historian, William Hubbard, "Whatever he delivered in the pulpit was soon put into an order of court, if of a civil, or set up as a practice in the church, if of an ecclesiastical concernment." His influence, too, was generally beneficent, though it was never used to further the cause of religious freedom, or of democracy, his theory of government being given in an oft-quoted passage: "Democracy, I do not conceive that ever God did ordain as a fit government either for church or commonwealth. ... As for Monarchy and aristocracy they are both for them clearly approved, and directed in Scripture yet so as (God) referreth the sovereignty to himselfe, and setteth up Theocracy in both, as the best form of government." He naturally took an active part in most, if not all, of the political and theological controversies of his time, the two principal of which were those concerning Antinomianism and the expulsion of Roger Williams. In the former his position was somewhat equivocal—he first supported and then violently opposed Anne Hutchinson,—in the latter he approved Williams's expulsion as "righteous in the eyes of God," and subsequently in a pamphlet discussion with...
Williams, particularly in his *Bloudy Tenent, Washed and made White in the Bland of the Lamb* (1647), vigorously opposed religious freedom. He was a man of great learning and was a prolific writer. His writings included *Keys to the Kingdom of Heaven and the Power thereof* (1644), *The Way of the Churches of Christ in New England* (1645), and *The Way of Congregational Churches Cleared* (1648), these works constituting an invaluable exposition of New England Congregationalism; and *Milk for Babes, Drawn out of the Breasts of Both Testaments, Chiefly for the Spiritual Nourishment of Boston Babes in either England, but may be of like Use for any Children* (1646), widely used for many years, in New England, for the religious instruction of children.

See the quaint sketch by Cotton Mather, John Cotton's grandson, in *Magnalia* (London, 1702), and a sketch by Cotton's contemporary and friend, Rev. Samuel Whiting, printed in Alexander Young's *Chronicles of the First Planters of the Colony of Massachusetts Bay from 1623 to 1636* (Boston, 1846); also A. W. McClure's *The Life of John Cotton* (Boston, 1846), a sketch in Arthur B. Ellis's *History of the First Church in Boston* (Boston, 1881), and a sketch in Williston Walker's *Ten New England Leaders* (New York, 1901). (W.B.)

**COTTON, SIR ROBERT BRUCE**, Bart. (1571-1632), English antiquary, the founder of the Cottonian library, born at Dencon in Huntingdonshire on the 22nd of January 1571, was a descendant, as he delighted to boast, of Robert Bruce. He was educated at Westminster school under William Camden the antiquary, and at Jesus College, Cambridge. His antiquarian tastes were early displayed in the collection of ancient records, charters and other manuscripts, which had been dispersed from the monastic libraries in the reign of Henry VIII.; and throughout the whole of his life he was an energetic collector of antiquities from all parts of England and the continent. His house at Westminster had a garden going down to the river and occupied part of the site of the present House of Lords. It was the meeting-place in the last years of Elizabeth's reign of the antiquarian society founded by Archbishop Parker. In 1600 Cotton visited the north of England with Camden in search of Pictish and Roman monuments and inscriptions. His reputation as an expert in heraldry led to his being asked by Queen Elizabeth to discuss the question of precedence between the English ambassador and the envoy of Spain, then in treaty at Calais. He discharged this task so well as to establish the precedence of the English ambassador. On 19th July 1620 he was knighted, and in 1668 he wrote a *Memorial on Abuses in the Navy*, that resulted in a navy commission, of which he was a member. He also presented to the king an historical *Inquiry into the Crown Revenues*, in which he speaks freely about the expenses of the royal household, and asserts that tollage and poundage are only to be levied in war time, and to "proceed out of good will, not of duty." In this paper he supported the creation of the order of baronets, each of whom was to pay the crown £1000; and in 1611 he himself received the title.

Cotton helped John Speed in the compilation of his *History of England* (1611), and was regarded by contemporaries as the compiler of Camden's *History of Elizabeth*. It seems more likely that it was executed by Camden, but that Cotton exercised a general supervision, especially with regard to the story of Mary queen of Scots. The presentation of his mother's history was naturally important to James I., and Cotton himself took a keen interest in the matter. He had had the room in Fotheringay where Mary was executed transferred to his family seat at Connington, and he preserved her letters among his valuable documents. In 1614 Arthur Agarde (q.v.) left his papers to him, and Camden's manuscripts came to him in 1623. In 1615 Cotton, as the intimate of the earl of Somerset, whose innocence he always maintained, was placed in confinement on the charge of being implicated in the murder of Sir Thomas Overbury; he confessed that he had acted as intermediary between Sarmiento, the Spanish ambassador, and Somerset, and had altered the dates of Somerset's correspondence. He was released after about eight months' imprisonment without formal trial, and obtained a pardon on payment of £500. His friendship with Gondoman, Spanish ambassador in England from 1613 to 1621, brought further suspicion, probably undeserved, upon Cotton, of unduly favoring the Catholic party. From Charles I. and Buckingham Cotton received no favour; his attitude towards the court had begun to change, and he became the intimate friend of Sir John Eliot, Sir Simonds d'Ewes and John Selden. He had entered parliament in 1604 as member for Huntington; in 1624 he sat for Old Sarum; in 1625 for Thetford; and in 1628 for Castle Rising, Norfolk. In the debate on supply in 1625 Cotton provided Eliot with full notes defending the action of the opposition in parliament, and in 1628 the leaders of the party met at Cotton's house to decide on their policy. In 1626 he gave advice before the council against debasing the standard of the coinage; and in January 1628 he was again before the council, urging the summons of a parliament. His arguments on the latter occasion are contained in his tract entitled *The Danger in which the Kingdom now standeth and the Remedy*. In October of the next year he was arrested, together with the earls of Bedford, Somerset, and Clare, for having circulated, with ironic purpose, a tract known as the *Proposition to bridge Parliament*, which had been addressed some fifteen years before by Sir Robert Dudley to James I., advising him to govern by force; the circulation of this by Parliamentarians was regarded as seditious, insubordinate, and contrary to the Church and constitution. Cotton denied knowledge of the matter, but the original was discovered in his house, and the copies had been put in circulation by a young man who lived after him and was said to be his natural son. Cotton was himself released the next month; but the proceedings in the star chamber continued, and, to his intense vexation, his library was sealed up by the king. He died on the 6th of May 1631, and was buried in Connington church, Huntingdonshire, where there is a monument to his memory.

Many of Cotton's pamphlets were widely read in manuscript during his lifetime, but only two of his works were printed, *The Reign of Henry III.* (1627) and *The Danger in which the Kingdom now standeth* (1628). His son, Sir Thomas (1594-1662), added considerably to the Cottonian library; and Sir John, the fourth baronet, presented it to the nation in 1700. In 1731 the collection, which had in the interval been removed to the Strand, and thence to Ashburnham House, was seriously damaged by fire. In 1753 it was transferred to the British Museum.

See the article *Libraries*, and Edward's *Lives of the Founders of the British Museum*, vol. i. Several of Cotton's papers have been printed as part of his title *Cottoni Posthuma*; others were published by Thomas Hearne.

**COTTON** (Fr. *coton*; from Arab. *qutum*), the most important of the vegetable fibres of the world, consisting of unicellular hairs which occur attached to the seeds of various species of plants, like *Gossypium*, belonging to the Mallow order (Malvaceae). Each fibre is formed by the outgrowth of a single epidermal cell of the testa or outer coat of the seed.

*Botany and Cultivation.*—The genus *Gossypium* includes herbs and shrubs, which have been cultivated from time immemorial, and are now found widely distributed throughout the tropical and subtropical regions of both hemispheres. South America, the West Indies, tropical Africa and Southern Asia are the homes of the various members, but the plants have been introduced with success into other lands, as is well indicated by the fact that although no species of *Gossypium* is native to the United States of America, that country now produces over two-thirds of the world's supply of cotton. Under normal conditions in warm climates many of the species are perennials, but, in the United States for example, climatic conditions necessitate the plants being renewed annually, even in the tropics it is often found advisable to sow as annuals to ensure the production of cotton of the best quality, to facilitate cultural operations, and to keep insect and fungoid pests in check.

Microscopic examination of a specimen of mature cotton shows that the hairs are flattened and twisted, resembling somewhat in general appearance an empty and twisted fire hose. This characteristic is of great economic importance, the natural twist facilitating the operation of spinning the fibres into thread or yarn. It also distinguishes the true cotton from the silk cottons or flosses, the fibres of which have no twist, and do not readily
spin into thread, and for this reason, amongst others, are very considerably less important as textile fibres. The chief of these silk cottons is kapok, consisting of the hairs borne on the interior of the pods (but not attached to the seeds) of *Eriodendron anfractuorum*, the silk cotton tree, a member of the Bombacaceae, an order very closely allied to the Malvaceae.

Classification.—Considerable difficulty is encountered in attempting to draw up a botanical classification of the species of *Gossypium*. Several are only known in cultivation, and we have but little knowledge of the wild parent forms from which they have descended. During the periods the cottons have been cultivated, selection, conscious or unconscious, has been carried on, resulting in the raising, from the same stock probably, in different places, of well-marked forms, which, in the absence of the history of their origin, might be regarded as different species. Then again, during at least the last four centuries, cotton plants have been distributed from one country to another, only to render still more difficult any attempt to establish definitely the origin of the varieties now grown. Under these circumstances it is not surprising to find that those who have paid attention to the botany of the cottons differ greatly in the number of species they recognize. Linnaeus described five or six species, de Candolle thirteen. Of the two Italian botanists who in comparatively recent years have monographed the group, Parlatore (*Le Specie dei cotoni*, 1866) recognizes seven species, whilst Todaro (*Relazione sullo stato del culto dei cotoni*, 1871–1881) describes over fifty species: many of these, however, are of but little economic importance, and, in spite of the difficulties mentioned above, it is possible for practical purposes to divide the commercially important plants into five species, placing these in two groups according to the character of the hairs borne on the seeds. Sir G. Watt's exhaustive work on *Wild and Cultivated Cotton Plants of the World* (1907) is the latest authority on the subject; and his views on some debated points have been incorporated in the following account.

A seed of "Sea Island cotton" is covered with long hairs only, which are readily pulled off, leaving the comparatively small black seed quite clean or with only a slight fuzz at the end, whereas a seed of "Upland" or ordinary American cotton bears both long and short hairs; the former are fairly easily detached (less easily, however, than in Sea Island cotton), and the latter adhere very firmly, so that when the long hairs are pulled off the seed remains completely covered with a short fuzz. This is also the case with the ordinary Indian and African cottons. There remains one other important group, the so-called "kidney" cottons in which there are only long hairs, and the seed easily comes away clean as with "Sea Island," but, instead of each seed being separate, the whole group in each of the three compartments of the capsule is firmly united together in a more or less kidney-shaped mass. Starting with this as the basis of classification, we can construct the following key, the remaining principal points of difference being indicated in their proper places—

1. *G. barbadense*, Linn. This plant, known only in cultivation, is usually regarded as native to the West Indies. Watt regards it as closely allied to *G. vilifolium*, and considers the modern stock a hybrid, and probably not indigenous to the West Indies. He classifies the modern high-class Sea Island cottons as *G. barbadense*, var. *maritima*. Whatever may be its true botanical name it is the plant known in commerce as "Sea Island" cotton, owing to its introduction and successful cultivation in the Sea Islands and the coastal districts of South Carolina, Georgia, and Florida. It yields the most valuable of all cottons, the hairs being long, fine and silky, and ranging in length from \( \frac{3}{4} \) to \( \frac{5}{2} \) in. By careful selection (the methods of which are described below) in the United States, the quality of the product was much improved, and on the recent revival of the cotton industry in the West Indies American "Sea Island" seed was introduced back again to the original home of the species.

Egyptian cotton is usually regarded as being derived from the same species. Watt considers many of the Egyptian cottons to be races or hybrids of *G. herbaceum*. Egyptian cotton in length of staple is intermediate between average Sea Island and average Upland. It has, however, certain characteristics which cause it to be in demand even in the United States, where during recent years Egyptian cotton has comprised about 80% of all the "foreign" cottons imported. These special qualities are its fineness, strength, elasticity and great natural twist, which combined enable it to make very fine, strong yarns, suited to the manufacture of the better qualities of hosiery, for mixing with silk and wool, for making lace, &c. It also mercerizes very well. The principal varieties of Egyptian cotton are: *Mitafifi*, the best-known and most extensively grown, hardy and but little affected by climatic variation. It is usually regarded as the standard Egyptian cotton; the lint is yellowish brown, the seeds black and almost smooth, usually with a little tuft of short green hairs at the ends. *Abassi*, a variety comparatively recently obtained by selection. The lint is pure white, very fine and silky, but not so strong as Mitaññi cotton. *Yamarnitch*, a variety known since about 1879, yields the finest and most silky lint of the white Egyptian cottons. *Bamia*, yielding a brown lint, very similar to Mitaññi, but slightly less valuable. *Ashmouni*, a variety principally cultivated in Upper Egypt. The lint is brown and generally resembles Mitaññi but is less valuable.

Other varieties are *Zifiri*, *Hamouli* and *Gallini*, all of minor importance.

2. *G. brasiliense*, Macf. (G. *peruvianum*, Engler), or kidney cotton. Amongst the varieties of cotton which are derived from this species appear to be Pernambuco, Maranhon, Ceara, Arcatay and Maceio cottons. The fibre is generally white, somewhat harsh and wiry, and especially adapted for mixing with wool. The staple varies in length from \( \frac{1}{2} \) to about \( \frac{1}{2} \) in. Some are quite white, others quite yellowish.

3. *G. hirsutum*, Linn. Although *G. barbadense* yields the most valuable cotton, *G. hirsutum* is the most important cotton-yielding plant, being the source of American cotton, i.e., Upland, Georgia, New Orleans and Texas varieties. The staple varies usually in length between \( \frac{1}{2} \) and \( \frac{1}{2} \) in. According to Watt there are many hybrids in American cottons between *G. hirsutum* and *G. mexicanum*. 

---

**Fig. 1.—Seed-hairs of the Cotton, *Gossypium herbaceum*. A. Part of seed-coat with hairs; B, insertion and lower part; B\(_1\), middle part; and B\(_2\), upper part of a hair.**

From Strasburger's *Lehrbuch der Botanik*, by permission of Gustav Fischer.
4. *G. herbaceum*, Linn. Levant cotton is derived from this species. The majority of the races of cotton cultivated in India are often referred to this species, which is closely allied to *G. hirsutum* and has been regarded as identical with it. Amongst the cottons of this source are Hinganghat, Tinnevelly, Dhwarar, Broach, Amraoti (Oomras or Oomrawatte), Kumta, Westerns, Dhorla, Veraval, Bengals, Sind and Bhaunagar. Watt dissents from this view and classes these Indian cottons as *G. obtusifolium* and *G. Nanking* with their varieties. The Indian cottons: are usually of short staple (about 1/8 in.); but are probably capable of improvement.

5. *G. arboresum*, Linn. This species is often considered as indigenous to India, but Dr Engler has pointed out that it is found wild in Upper Guinea, Abyssinia, Senegal, etc. It is the "tree cotton" of India and Africa, being typically a large shrub or small tree. The fibre is fine and silky, of about an inch in length. In India it is known as Nurm a Deo cotton, and is usually stated to be employed for making thread for the turbans of the priests. Commercially it is of comparatively minor importance.

The following table, summarized from the *Handbook to the Imperoyal Institute Cotton Exhibition, 1905*, giving the length of staple and value on one date (January 16, 1905), will serve to indicate the comparative values of some of the principal commercial cottons. The actual value, of course, fluctuates greatly.

The close relationship between the length of the staple and the market price will be at once apparent.

**Cultivation.**—Cotton is very widely cultivated throughout the world, being grown on a greater or less scale as a commercial crop in almost every country included in the broad belt between latitudes 45° N. and 30° S., or approximately within the isothermal lines of 60° F.

The cotton plant requires certain conditions for its successful cultivation; but, given these, it is very little affected by seasonal vicissitudes. Thus, for example, in the United States the worst season rarely diminishes the crop by more than about a quarter or one-third; such a thing as a "half-crop" is unknown. Various climatic factors may cause temporary checks, but the growing and maturing period is sufficiently long to allow the plants to overcome these disturbances.

Cotton requires for its development from six to seven months of favourable weather. It thrives in a warm atmosphere, even in a very hot one, provided that it is moist and that the transpiration is not in excess of the supply of water. An idea of the requirements of the plant will perhaps be afforded by summarizing the conditions which have been found to give the best results in the United States.

During April (when the seed is usually sown) and May frequent light showers, which keep the ground sufficiently moist to assist germination and the growth of the young plants, are desired. Three to four inches of rain per month is the average. The active growing period is from early June to about the middle of August. During June and the first fortnight in July plenty of sunshine is necessary, accompanied by sufficient rain to promote health but not excessive, growth; the normal rainfall in the cotton belt for this period is about 4 in. per month. During the second portion of July and the first of August a slightly higher rainfall is beneficial, and even heavy rains do little harm, provided the subsequent months are dry and warm. The first flowers usually appear in June, and the bolls ripened from early in August. Picking takes place normally during September and October, and during these months dry weather is essential. Flowering and fruiting go on continually, although in diminishing degree, until the advent of frost, which kills the flowers and young bolls and so puts an end to the production of cotton for the season.

In the tropics the essential requirements are very similar, but there the dry season checks production in much the same way as do the frosts in temperate climates. In either case an adequate but not excessive rainfall, increasing from the time of sowing to the period of active growth, and then decreasing as the bolls ripen, with a dry picking season, combined with sunny days and warm nights, provide the ideal conditions for successful cotton cultivation. In regions where climatic conditions are favourable, cotton can be grown successfully on a large scale, and it can be grown on light sandy soils, loams, heavy clays and sandy "bottom" lands with varying success. Sandy uplands produce a short stalk which bears fairly well. Clay and "bottom" lands produce a large, leafy plant, yielding less lint in proportion. The most suitable soils are medium grades of loam. The soil should be able to maintain very uniform conditions of moisture. Sudden variations in the amount of water supplied are injurious: a sandy soil cannot retain water; on the other hand a clay soil often maintains too great a supply, and rank growth with excess of foliage ensues. The best soil for cotton is thus a deep, well-drained loam, able to afford a uniform supply of moisture during the growing period. Wind is another important factor, as cotton does not do well in localities subject to very high winds; and in exposed situations, otherwise favourable, wind belts have at times to be provided.

**Cultivation in the United States.**—The United States being the most important cotton-producing country, the methods of cultivation practised there are first described, notes on methods adopted in other countries being added only when these differ considerably from American practice.

The culture of cotton must be a clean one. It is not necessarily deep culture, and, during the growing season the cultivation is preferably very shallow. The result is a great destruction of the humus of the soil, and great leaching and washing, especially in the light loams of the hill country of the United States. The main object, therefore, of the American cotton-planter is to prevent erosion. Wherever the planters have failed to guard their fields by hillside ploughing and terracing, these have been extensively denuded of soil, rendering them barren, and devastating other fields lying at a lower level, which are covered by the wash. The hillsides have gradually to be terraced with the plough, upon almost an exact level. On the better farms this is done with a spirit-level or compass from time to time and hillside ditches put in at the proper places. In the moist bottom-lands along the rivers it is the custom to throw the soil up in high beds with the plough, and then to cultivate them deep. This is the more common method of drainage, but it is expensive, as it has to be renewed every few years. More intelligent planters drain their bottom-lands with underground or open drains. In the case of small plantations the difficulties of adjusting a right-of-way for outlet ditches have interfered seriously with this plan. Many planters question the wisdom of deepbreaking and subsoiling. There can be no question that a deep soil is better for the cotton-plant; but the expense of obtaining it, the risk of injuring the soil through leaching, and the danger of bringing poor soil to the surface, have led many planters to oppose this plan. Sandy soils are made thereby too dry and leachy, and it is a questionable proceeding to turn the heavy clays upon the top. Planters are, as a result, divided in opinion as to the wisdom of subsoiling. Nothing definite can be said with regard to a rotation of crops
upon the cotton plantation. Planters appreciate generally the value of broad-leaved and narrow-leaved plants and root crops, but there is an absence of exact knowledge, with the result that their practices are very varied. It is believed that the rotation must differ with every variety of soil, with the result that each planter has his own method, and little can be said in general. A more careful study of the physical as well as the chemical properties of a soil must precede intelligent experimentation in rotation. This knowledge is still lacking with regard to most of the cotton soils. The only uniform practice is to let the fields "rest" when they have become exhausted. Nature then restores them very rapidly. The exhaustion of the soil under cotton culture is chiefly due to the loss of humus, and nature soon puts this back in the excellent climate of the cotton-growing belt. Fields considered utterly useless in, are used to "rest" for years, when cultivated again have produced better crops than those which had been under a more or less thoughtful rotation. In spite of the clean culture, good crops of cotton have been grown on some soils in the south for more than forty successive years. The fibre takes almost nothing from the land, and where the seeds are restored to the soil in some form, even without other fertilizers, the exhaustion of the soil is very slow. If the burning-up of humus and the leaching of the soil be prevented, there is no reason why the cotton soil should not produce good crops continuously for an indefinite time. Bedding up land previous to planting is almost universal. The bed forms a warm seed-bed in the cool weather of early spring, and holds the manure which is drilled in usually to better advantage. The plants are generally left 2 or 3 in. above the middle of the row, which in four-foot rows gives a slope of 1 in. to the foot, causing the plough to lean from the plants in cultivating, and thus to cut fewer roots. The plants are usually cut out with a hoe from 8 to 14 in. apart. It seems to make little difference exactly what distance they are, so long as they are not wider apart on average land than 1 ft. On rich bottom-land they should be more distant. The seed is dropped from a planter, five or six seeds in a single line, at regular intervals 10 to 12 in. apart. A narrow deep furrow is usually run immediately in advance of the planter, to break up the soil under the seed. The only time the hoe is used is to thin out the cotton in the row; all the rest of the cultivation is by various forms of ploughs and so-called cultivators. The question of deep and shallow culture has been much discussed among planters without any conclusion applicable to all soils being reached. All grass and weeds, and even half-grown bolls in great numbers, unless the following day they are cut down, and the crust must be broken after every rain, but these seem to be the only principles upon which all agree. The most effective tool against the weeds is a broad sharp "sweep," as it is called, which takes everything it meets, while going shallower than most ploughs. Harrows and cultivators are used where there are few weeds, and the mulching process is the one desired.

The date of cotton-planting varies from March 1 to June 1, according to situation. Planting begins early in March in Southern Texas, and the first blooms will appear there about May 15. Planting may be done as late as April 15 in the Piedmont region of North Carolina, and continue as late as the end of May. The first blooms will appear in this region about July 15. Picking may begin on July 10 in Southern Texas, and continue late into the winter, or until the frost kills the plants. It may not begin until September 10 in Piedmont, North Carolina. It is a peculiarity of the cotton-plant to lose a great many of its blooms and bolls. When the weather is not favourable at the fruiting stage, the otherwise hardly cotton plant displays its great weakness in this way. It sheds its "forms" (as the buds are called), blooms, and even half-grown bolls in great numbers. It has frequently been noted that even well-fertilized plants upon good soil will mature only 15 or 20% of the bolls produced. No means are known so far for preventing this great waste. Experts are at an entire loss to form a correct idea of the cause, or to apply any effective remedy.

Cotton-picking is at once the most difficult and most expensive operation in cotton production. It is paid for at the rate of from 45 to 50 cents per cwt. of seed cotton. The work is light, and is effectually performed by women and even children, as well as men; but it is tedious and requires care. The picking season will average 100 days. It is difficult to get the hands to work until the cotton is fully opened, and it is hard to induce them to pick over 100 lb a day, though some expert hands are found in every cotton plantation who can pick twice as much. The loss resulting from careless work is very serious. The cotton falls out easily or is dropped. The careless gathering of dead leaves and twigs, and the soiling of the cotton by earth or by the natural colouring matter from the bolls, injure the quality. It has been commonly thought that the production of cotton in the south is limited by the amount that can be picked, but this limit is evidently very remote. The negro population of the towns and villages of the cotton country is usually available for a considerable share in cotton-picking. There is in the cotton states a rural population of over 7,000,000, more or less occupied in cotton-growing, and capable, at the low average of 100 lb a day, of picking daily nearly 500,000 bales. It is evident, therefore, that if this number could work through the whole season of 100 days, they could pick three or four times as much cotton as the largest crop ever made. Great efforts have been made to devise cotton-picking machines, but, as yet, complete success has not been attained. Lowne's machine is useful in ordinary wide-planted fields and when the ground is sufficiently hard.

Cotton Ginning.—The crop having been picked, it has to be prepared for purpose of manufacture. This comprises separating the fibre or lint from the seeds, the operation being known as "ginning." When this has been accomplished the weight of the crop is reduced to about one-third, each 100 lb of seed cotton as picked yielding some 33 lb of lint and 66 lb of cotton seed. The actual amounts differ with different varieties, conditions of cultivation, methods of ginning, &c.; a recent estimate in the United States gives 35% of lint for Upland cotton and 25% for Sea Island cotton as more accurate.

The separation of lint from seed is accomplished in various ways. The most primitive is hand-picking, the fibre being laboriously pulled from off each seed, as still practised in parts of Africa. In modern commercial cotton production ginning machines are always used. Very simple machines are used in some parts of Africa. The simplest cotton gin in extensive use is the "churka," used from early times, and still largely employed in India and China. It consists essentially of two rollers either both of wood or one of wood and one of iron, geared to revolve in contact in opposite directions; the seed cotton is fed to the rollers, the lint is drawn through, and the seed being unable to pass between the rollers is rejected. With this primitive machine, worked by hand, about 5 lb of lint is the daily output. In the Macarthy roller gin, the lint, drawn by a roller covered with leather (preferably walrus hide), is drawn between a metal plate called the "doctor" (fixed tangentially to the roller and very close to it) and a blade called the "beater" or knife, which rapidly moves up and down immediately behind, and parallel to, the fixed plate. The lint is held by the roughness of the roller, and the blade of the knife or beater readily detaches the seed from the lint; the seed falls through a grid, while the lint passes over the roller to the other side of the machine. A hand Macarthy roller gin worked by two men will clean about 4 to 6 lb of lint per hour. A similar, but larger machine, requiring about 1½ horse-power to run it, will turn out 30 to 60 lb of Egyptian or 60 to 80 lb of Sea Island cleaned cotton per hour. By simple modifications the Macarthy gin can be used for all kinds of cotton. Various attempts have been made to substitute a comb for the roller or beater, and one of the latest productions is the "Universal fibre gin," in which a series of blade combs working horizontally replace the solid beater and so-called knife of the Macarthy gin.

Opposed to the various types of roller gins is the "saw gin," invented by Eli Whitney, an American, in 1792. This machine, under various modifications, is employed for ginning the greater portion of the cotton grown in the Southern States of America. It consists essentially of a series of circular notched disks, the so-called saws, revolving between the interstices of an iron bed
COTTON

upon which the cotton is placed: the teeth of the "saws" catch the lint and pull it off from the seeds, then a revolving brush removes the detached lint from the saws, and creates sufficient draught to carry the lint out of the machine to some distance. Saw gins do considerable damage to the fibre, but for short-stapled cotton they are largely used, owing to their great capacity. The average yield of lint per "saw" in the United States, when working under perfect conditions, is about 6 lb per hour. Some of the American ginners are very large indeed, a number (Bulletin of the Bureau of the Census on Cotton Production) being reported as containing on the average 1,156 saws with an average production of 4120 bales of cotton. Saw gins are not adapted to long-stapled cottons, such as Sea Island and Egyptian, which are generally ginned by machines of the Macarthy type.

The machine which will gin the largest quantity in the shortest time is naturally preferred, unless such injury is occasioned as materially to diminish the market value of the cotton. This has sometimes been to the extent of 1d. or 2d. per lb and even more as regards Sea Island and other long-stapled cottons. The production, therefore, of the most perfect and efficient cotton-cleaning machinery is of importance alike to the planter and manufacturer.

Baling.—The cotton leaves the ginning machine in a very loose condition, and has to be compressed into bales for convenience of transport. Large baling presses are worked by hydraulic power; the operation needs no special description. Bales from different countries vary greatly in size, weight and appearance. The American bale has been described in a standard American book on cotton as "the clumsiest, dirtiest, most expensive and most wasteful package, in which cotton or any other commodity of like value is anywhere put up." Suggestions for its improvement, which if carried out would (it is estimated) result in a monetary saving of £1,000,000 annually, were made by the Lancashire Private Cotton Investigation Commission which visited the Southern States of America in 1906.

The approximate weights of some of the principal bales on the English market are as follows—

With baling the work of the producer is concluded.

Cultivation in Egypt.—Climatic conditions in Egypt differ radically from those in the United States, the rainfall being so small as to be quite insufficient for the needs of the plant, very little rain indeed falling in the Nile Delta during the whole growing season of the crop: yet Egypt is in order the third cotton-producing country of the world, elaborate irrigation works supplying the crop with the requisite water. The area devoted to cotton in Egypt is about 1,800,000 acres, and nine-tenths of it is in the Nile Delta. The delta soil is typically a heavy, black, alluvial clay, very fertile, but difficult to work; admixture of sand is beneficial, and the localities where this occurs yield the best cotton. Formerly in Egypt the cotton was treated as a perennial, but this practice has been generally abandoned, and fresh plants are raised from seed each year, as in America; one great advantage is that more than one crop can thus be obtained each year. The following rotation is frequently adopted. It should be noted that in Egypt the year is divided into three seasons—winter, summer and "Nili." The two first explain themselves; Nili is the season in which the Nile overflows its banks.

For cotton cultivation the land is ploughed, carefully levelled, and then thrown up into ridges about 3 ft. apart. Channels formed at right angles to the cultivation ridges provide for the access of water to the crop. The seeds, previously soaked, are sown, usually in March, on the sides of the ridges, and the land watered. After the seedlings appear, thinning is completed in usually three successive hoeings, the plants being watered after thinning, and subsequently at intervals of from twelve to fifteen days, until about the end of August when picking commences. The total amount of water given is approximately equivalent to a rainfall of about 35 in. The crop is picked, ginned and baled in the usual way, the Macarthy style action roller gins being almost exclusively employed.

Cotton Seed.—The history of no agricultural product contains more of interest and instruction for the student of economics than that of cotton seed in the United States. The revolution in its treatment is a real romance of industry. Up till 1870 or thereabouts, cotton seed was regarded as a positive nuisance upon the American plantation. It was left to accumulate in vast heaps about ginhouses, to the annoyance of the farmer and the injury of his premises. Cotton seed in those days was the object of so much aversion that the planter burned it or threw it into running streams, as was most convenient. If the seed were allowed to lie about, it rotted, and land and the animals, eating it, often died. It was very difficult to burn, and when dumped into rivers and creeks was carried out by flood water to fill the edges of the flats with a decaying and offensive mass of vegetable matter. Although used in the early days to a limited extent as a food for milk cows and other stock, and to a larger extent as a manure, no systematic efforts were made anywhere in the South to manufacture the seed until the later 'fifties, when the first cotton seed mills were established. It is said that there were only seven cotton oil mills in the South in 1860. The cotton-growing industry was interrupted by the Civil War, and the seed-milling business did not begin again until 1868. After that time the number of mills rapidly increased. There were 25 in the South in 1870, 50 in 1880, 120 in 1890, and about 500 in 1910, about one-third being in Texas.

Experience shows that 1000 lb of seed are produced for every 500 lb of cotton brought to market. On the basis, therefore, of a cotton crop of 10,000,000 bales of 500 lb each, there are produced 5,000,000 tons of cotton seed. If about 3,000,000 tons only are pressed, there remain to be utilized on the farm, 2,000,000 tons of cotton seed, which, if manufactured, would produce a total of $200,000,000 from cotton seed. In contrast with the farmers of the 'sixties, the southern planter of the 20th century appreciates the value of his cotton seed, and farmers, too remote from the mills to get it pressed, now feed to their stock all the cotton seed they conveniently can, and use the residue either in compost or directly as manure. The average of a large number of analyses of Upland cotton seed gives the following figures for its fertilizing constituents:

- Nitrogen, 3-07%; phosphoric acid, 1-02%; potash, 3-17%;
- besides small amounts of lime, magnesia and other valuable but less important ingredients.

Sea Island cotton seed is rather more valuable than Upland: the corresponding figures for the three principal constituents being nitrogen 3-57, phosphoric acid 1-69, potash 5-59. Using average prices paid for nitrogen, phosphoric acid, and potash, we find important large quantities and in good forms, these ingredients, in a ton of cotton seed, amount to the sum of $100 worth of fertilizing material. Compared with the commercial fertilizer which the farmer has to buy, cotton seed possesses, therefore, a distinct value.

The products of cotton seed have become important elements in the national industry of the United States. The main product is the refined oil, which is used for a great number of purposes, such as a substitute for olive oil, mixed with beef products for preparation of compound lard, which is estimated to consume one-third of cotton seed oil produced in the States. The poorer grades are employed in the manufacture of soap, candles and phonograph records. Miners' lamp oil consists of the bleached oil mixed with kerosene. Cotton seed cake or meal (the residue after the oil is extracted) is one of the most feeding stuffs, as the following simple comparison between it and oats and corn will show:
Cotton seed meal, though poor in carbohydrates, the fat- and energy-supplying ingredients, is exceedingly rich in protein, the nerve- and muscle-feeding ingredients. But it still contains a large amount of oil, which forms animal fat and heat, and thus makes up for part of its deficiency in carbohydrates. The meal, in fact, is so rich in protein that it is best utilized as a food for animals when mixed with some coarse fodder, thus furnishing a more evenly-balanced ration. In comparative valuations of feeding stuffs it has been found that cotton seed meal exceeds corn meal by 62%, wheat by 67%, and raw cotton seed by 26%. Cotton seed meal, in the absence of sufficient stock to consume it, is also used extensively as a fertiliser, and for this purpose it is worth, determining the price on the same basis as used above for the seed, from $19 to $20 per ton. But it has seldom reached this price, except in some of the northern states, where it is used for feeding purposes. A more practical proceeding would be to feed the meal to animals and apply the resulting manure to the soil. When this is done, from 80 to 90% of the fertilizing material of the meal is recovered in the manure, only 10 to 20% being converted by the animal into meat and milk. The profit derived from the 20% thus removed is a very large one. These facts indicate that we have here an agricultural product the market price of which is still far below its value as compared, on the basis of its chemical composition, either with other feeding stuffs or with other fertilizers. This is probably destined to be used even more extensively as a fertiliser before the demand for it as a feeding stuff becomes equal to the supply, practically all the cotton seed meal of the south will ultimately be used for feeding. One explanation of this condition of things is that there is still a large surplus of cotton seed which cannot be manufactured by the mills. Another reason is found in the absence of cattle in the south to eat it.

With the consideration of cotton seed oil and meal we have not, however, exhausted its possibilities. Cotton seed hulls constitute about half the weight of the ginned seed. After the seed of Upland cotton has been passed through a fine gin, which takes off the short lint or linters left upon it by the farm gin, it is passed through what is called a sheller, consisting of a revolving cylinder, armed with numerous knives, which cut the seed into two and force the kernels or meats from the shells. The shells and kernels are then separated in a winnowing machine. This removal of the shell makes a great difference in the oilcake, as the decorticated cake is more nutritious than the undecorticated.

For a long time these shells or hulls, as they are called, were burned at oil mills for fuel, 2 1/2 tons being held equal to a cord of wood, and 40 tons to a ton of coal. The hulls thus burned produced an ash containing an average of 9% of phosphoric acid and 24% of potash—a very valuable fertilizer in itself, and one eagerly sought by growers of tobacco and vegetables. It was not long, however, before the stock-feeder in the South found that cotton seed hulls were an excellent substitute for hay. They are used on a very large scale in the vicinity of oil mills in southern cities like Memphis, New Orleans, Houston, and Little Rock, from 500 to 5000 cattle being often collected in a single yard for this purpose. No other feed is required, the only provision necessary being an adequate supply of water and an occasional allowance of salt. Many thousands of cattle are fattened annually in this way at remarkably low cost.

Cotton seed meal is now given to the employment of the seed in new cotton countries, and oil expression is practised in the West Indies. Hull is the principal seat of the industry in Great Britain, and enormous quantities of Indian and Egyptian cotton seed are imported and worked up.

The following diagram, modified from one by Grimshaw, in accordance with the results obtained by the better class of modern mills, gives an interesting résumé of the products obtained from a ton of cotton seed:

**Pests and Diseases of the Cotton Plant.**

Insect Pests.—It is common knowledge that when any plant is cultivated on a large scale various diseases and pests frequently appear. In some cases the pest was already present but of minor importance. As the supply of its favourite food plant is increased, conditions of life for the pest are improved, and it accordingly multiplies also, possibly becoming a serious hindrance to successful cultivation. At other times the pest is introduced, and under congenial conditions (and possibly in the absence of some other organism which keeps it in check in its native country) increases accordingly. Some idea of the enormous damage wrought by the collective attacks of individually small and weak animals may be gathered from the fact that a conservative estimate places the loss due to insect attacks on cotton in the United States at the astounding figure of $50,000,000 ($12,000,000) annually. Of this total no less than $40,000,000 ($8,000,000) is credited to a small beetle, the cotton boll weevil, and to two caterpillars. The best means of combating these attacks depends on a knowledge of the life-histories and habits of the pests. The following notes deal only with the practical side of the question, and as the United States produce some seven-tenths of the world's cotton crop attention is especially directed to the principal cotton pests of that country. Those of other regions are only referred to when sufficiently important to demand separate notice.

The cotton boll weevil (Anthonomus grandis), a small grey weevil often called the Mexican boll weevil, is the most serious pest of cotton in the United States, where the damage done by it in 1907 was estimated at about $5,000,000. It steadily increased in destructiveness during the preceding eight years. Attention was drawn to it in 1832, when it caused the abandonment of cotton cultivation about Monclova in Mexico. About 1893 it appeared in Texas, and then rapidly spread. It is easily transported from place to place in seed-cotton, and for this reason the Egyptian government in 1904 prohibited the importation of American cotton seed. Not only is the pest carried from place to place, but it also migrates, and in 1907 it crossed from Louisiana, where it first appeared in 1905, to Mississippi. That the insect is likely to prove adaptable is perhaps indicated by the fact that in 1906 it made a northward advance of about 60 m. in a season with no obvious special features favouring the pest. Its eastern progress was also rapid. "The additional territory infested during 1904 aggregates about 15,000,000 sq. m., representing approximately an area devoted to the culture of cotton of 900,000 acres" (Year-book, U.S. Dept. Agriculture, 1904). In 1906 the additional area invaded amounted to 1,500,000 acres (Ibid., 1906).
The adult weevils puncture the young flower-buds and deposit eggs; and as the grubs develop, the buds drop. They also lay eggs later in the year in the young bolls. These do not drop, but as the grubs develop the cotton is ruined and the bolls usually become discoloured and crack, their contents being rendered useless.

No certain remedy is known for the destruction on a commercial scale of the boll weevil, but every effort has been made in the United States to check the advance of the insect, to ascertain and encourage its natural enemies, and to propagate races of cotton which resist its attacks. Special interest attaches to the investigations made by Mr. O. F. Cook, of the U.S. Dept. of Agriculture, in Guatemala. The Indians in part of Guatemala raise cotton, although the boll weevil is abundant. Examination showed that although the weevil attacked the young buds these did not drop off, but that a special growth of tissue inside the bud frequently killed the grub. Also, inside the young bolls which had been pierced a similar pellorisation or growth of tissue was set up, which enveloped and killed the pest. Probably by unconscious selection of surviving plants through long ages this type has been evolved in Guatemala, and experiments have been made to develop weevil-resistant races in the United States.

It is also found that the boll weevil is attracted and eaten by birds and is killed by the “kelep.” Attempts have been made to introduce this into the infested area in Texas; but owing to the winter proving fatal to the “kelep” its usefulness may be restricted to tropical and subtropical regions.

The cotton bollworm (Chloridea obsoleta, also known as Heliothis armiger) is a caterpillar. The parent moth lays eggs, from which the young “worms” hatch out. They bore holes and penetrate into flower-buds and young bolls, causing them to drop. Fortunately the “worms” prefer maize to cotton, and the inter-planting at proper times of maize, to be cut down and destroyed when well infested, is a method commonly employed to keep down this pest. Paris green kills it in its young stages before it has entered the buds or bolls. The boll worm is most destructive in the south-western states, where the damage done is said to vary from 2 to 60% of the crop. Taking an average of 4½%, the annual loss due to the pest is estimated at about £2,500,000, and it occupies second place amongst the serious cotton pests of the U.S.A. The boll worm is widely spread through the tropical and temperate zones. It occurs in a country where it is a pest a cotton, e.g. in India it attacks various plats but not cotton. It has not yet been reported as a cotton pest in the West Indies.

The Egyptian boll worm (Earias insulana) is the most important insect pest in Egypt and occurs also in other parts of Africa. Indian boll worms include the same species, and the closely related Earias fabia, which also occurs in Egypt.

The cotton worm (Aletia argillacea)—also called cotton caterpillar, cotton army worm, cotton-leaf worm—is also one stage in the life-history of a moth. It is a voracious creature, and uncheked will often totally destroy a crop. In former years the annual damage done by it in the United States was assessed at £4,000,000 to £8,000,000. Dusting with Paris green is, however, an efficient remedy if promptly applied at the outset of the attack. The annual damage was in 1906 reduced to £1,000,000 to £2,000,000, and this on a larger area devoted to cotton than in the case of the estimate given above. It is the most serious pest of cotton in the West Indies. The Egyptian cotton worm is Prodenia littoralis.

The cotton boll weevil ("cut worms") of various species of Agrotis and other moths occur in all parts of the world and attack young cotton. They can be killed by spreading about cabbage leave, &c., poisoned with Paris green.

Locusts, green fly, leaf-bugs, blister mites, and various other pests also damage cotton, in a similar way to that in which they injure other crops.

The "cotton stalkers," various species of Dysdercus, are widely distributed, occurring for example in America, the West Indies, Africa, India, &c. The larvae suck the sap from the young bolls and seeds, causing shrivelling and reduction in quantity of fibre. They are called "stalkers" because their excrement is yellow and stains the fibre; also if crushed during the process of ginning they give the cotton a reddish coloration. The Egyptian cotton seed bug or cotton stainer belongs to another genus, being Oxyacentus hyalinipennis. Other species of this genus occur on the west coast of Africa. They do considerable damage to cotton seed.

Fungoid Diseases.—"Wilt disease," or "frenching," perhaps the most important of the fungoid disease of cotton in the United States, is due to Neocosmospora vasinfecta. Young plants a few inches high are usually attacked; the leaves, beginning with the lower ones, turn yellow, and afterwards become brown and drop. The plants remain very dwarf and generally unhealthy, or die. The roots also are affected, and instead of growing considerably in length, branch repeatedly and give rise to little tufts of rootlets. There is no method known of curing this disease, and all that can be done is to take every precaution to eradicate it, by pulling up and burning diseased plants, isolating the infected area by means of trenches, and avoiding growing cotton, or an allied plant such as the ochro (Hibiscus esculentus), in the field. Fortunately the careful work of the U.S. Department of Agriculture and of planters such as Mr. E. L. Rivers of James Island, South Carolina, has resulted in the production of disease-resistant races. In one instance Mr. Rivers had saved a boll weevil infested field. The seed was saved and gave rise to a number of plants all of which grew healthily in an infected field, whereas 95% of ordinary Sea island cotton plants from seed from a non-infected field planted alongside as a control were killed. The resistance was well maintained in succeeding generations, and races so raised form a practical means of combating this serious disease.

In "Root rot," as the name implies, the roots are attacked, the fungus being a species of Oosanum, which envelops the roots in a white coating of mould or mycelium. The roots are prevented from fulfilling their function of taking up water and salts from the soil; the leaves accordingly droop, and the whole plant withers and in bad attacks dies. It has yearly proved a more serious danger in Texas and other parts of the south-west of the United States, and the damage due to it in Texas during 1905 was estimated at about £75,000. No remedy is known for the disease, and cotton should not be planted on infected land for at least three or four years.

"Boll rot," or "Anthracnose," is a disease which may at times be sufficiently serious to destroy from 10 to 50% of the crop. The fungus which causes it (Cotylotrichum gossypii) is closely related to one of the fungi attacking sugar-cane in various parts of the world. Small red-brown spots appear on the bolls, gradually enlarge, and develop into irregular black and grey patches. The damage may be only slight, or the entire boll may ripen prematurely and become dry and dead.

Many other diseases occur, but the above are sufficient to indicate some of the principal ones in the most important cotton countries of the world.

Improvement of Cotton by Seed Selection.

In the cotton belt of the United States it would be possible to put a still greater acreage under this crop, but the tendency is rather towards what is known as "diversified" or mixed farming than to making cotton the sole important crop. Cotton, however, is in increasing demand, and the problem for the American cotton planter is to obtain a better yield of cotton from the same area,—by "better yield" meaning an increase not only in quantity but also in quality of lint. This ideal is before the cotton grower in all parts of the world, but it is one that is not always taken to realize it. Some of the United States planters are alert to take advantage of the application of science to industry, and in many cases even to render active assistance, and very successful results have been attained by the co-operation of the United States Department of Agriculture and planters. With the improvement of cotton the name of Mr. Herbert J. Webber is prominently associated, and a full discussion of methods and results will be found in his various papers in the Year-books of the U.S. Department of Agriculture. The principle on which the work is based is that plants have their individualities...
and tend to transmit them to their progeny. Accordingly a selection of particular plants to breed from, because they possess certain desirable characteristics, is as rational as the selection of particular animals for breeding purposes in order to maintain the character of a herd of cattle or of a flock of sheep.

Inspection of a field of cotton shows that different plants vary as regards productiveness, length, and character of the lint, period of ripening, power of resistance to various pests and of withstanding drought. A simple method of increasing the yield is that practised with success by some growers in the States. Pickers are trained to recognize the best plants, "that is, those most productive, earliest in ripening, and having the largest, best formed and most numerous bolls." These pickers go carefully over the field, usually just before the second picking, and gather ripe cotton from the best plants only; this selected seed cotton is ginned separately, and the seed used for sowing the next year's crop.

A more elaborate method of selection is practised by some of the Sea Island cotton planters in the Sea Islands, famous for the quality of their cotton. A field is gone over carefully, and perhaps some 50 of the best plants selected; a second examination in the field reduces these perhaps to one half, and each plant is numbered. The cotton from each is collected and kept separately, and at the end of the season carefully examined and weighed, and a final selection is then made which reduces the number to perhaps five; the cotton from each of these plants is ginned separately and the seed preserved for sowing. The simplest possible case in which only one plant is finally selected is illustrated in the diagram.

![Diagram of cotton selection process]

Improvement of Cotton by Seed Selection.

From the seeds of the selected plant of the 1st year about 500 plants can be raised in the next year. One plant is selected again from these 500, and the general crop of seed is used to sow about five acres for the 3rd year, from which seed is obtained for the general crop in the 4th year. One special plant is selected each year from the 500 raised from the previous season's test plant, and in four years' time the progeny of this plant constitutes the "general crop." The practice may be modified according to the size of estate by selecting more than one plant each year, but the principle remains unaltered. This method is in actual use by growers of Sea Island cotton in America and in the islands off the coast of S. Carolina, the greatest care is taken to enhance the quality of the lint, which has been gradually improved in length, fineness and silkiness. Mr Webber, in summing up, says, "When Sea Island cotton was first introduced into the United States from the West Indies, it was a perennial plant, unsuited to the duration of the season of the latitude of the Sea Islands of S. Carolina; but, through the selection of seed from early maturing individual plants, the cotton has been rendered much earlier, until now it is thoroughly adapted to the existing conditions. The fibre has increased in length from about 1 1/2 to 2 1/2 in., and the plants have at the same time been increased in productiveness. The custom of carefully selecting the seed has grown with the industry and may be said to be inseparable from it. It is only by such careful and continuous selection that the staple of these high-bred strains can be kept up to its present superiority, and if for any reason the selection is interrupted there is a general and rapid decline in quality."

When selection is being made for several characters at the same time, and also in hybridization experiments, where it is important to have full records of the characters of individual plants and their progeny, "score cards," such as are used in judging stock, with a scale of points, are used.

The improvements desired in cotton vary to some degree in different countries, according to the present character of the plants, climatic conditions, the chief pests, special market requirements, and other circumstances. Amongst the most important desiderata are:

1. Increased Yield.
2. Increase in Length of Lint.—Webber records the case of Stamm Egyptian cotton imported into Columbia, in which by simple selection, as outlived above, during two years plants were obtained uniformly earlier, more productive, and yielding longer and better lint.
3. Uniformity in Length of the Lint.—This is important especially in the long-stapled cottons, unevenness leading to waste in manufacture, and consequently to a lower price for the cotton.
4. Strength of Fibre.—Long-stapled cottons have been produced in the States by crossing Upland and Sea Island cotton. These hybrids produce a lint which is long and silky, but often deficient in strength: selection for strength amongst the hybrids, with due regard to length, may overcome this.
5. Season of Maturating.—Seed should be selected from early and late opening bolls, according to requirements. Earliness is especially important in countries where the season is short.
6. Adaptation to Soil and Climate.—High-class cottons often do not flourish if introduced into a new country. They are adapted to special conditions which are lacking in their new surroundings, but a few will probably do fairly well the first year, and the seeds from these probably better the next, and so on, so that in a few years' time a strain may be available which is equal or even superior to the original one introduced.
7. Resistance to Disease.—The method employed is to select, for seed purposes, plants which are resistant to the particular disease, or has sometimes a field of cotton attacked by some disease, perhaps "wilt," and a comparatively few plants are but very slightly affected. These are propagated, and there are instances as described above of very successful and commercially important results having been attained. Special interest attaches to experiments made in the United States to endeavour to raise races of cotton resistant to the boll weevil.
8. Resistance to Weather.—Strong winds and heavy rains do much damage to cotton by blowing or beating the lint out of the bolls. In some instances a slight difference in the shaepe, mode of opening, &c., of the boll prevents this, and accordingly seed is selected from bolls which suffer least under the particular adverse conditions.

Attention has been paid in the West Indies to seed selection, by the officers of the imperial Department of Agriculture, with the object of retaining for West Indian Sea Island cotton its place as the most valuable cotton on the British market.

In India, where conditions are much more diversified and it is extremely difficult to induce the native cultivator to adopt new methods, attention has also been directed during recent years to the improvement of the existing races. Efforts have been made in the same direction in Egypt, West Africa, &c.

The World's Commercial Cotton Crop.

It is impossible to give an exact return of the total amount of cotton produced in the world, owing to the fact that in China, India and other eastern countries, in Mexico, Brazil, parts of the Russian empire, tropical Africa, &c., considerable—in some cases very large—quantities of cotton are made up locally into wearing apparel, &c., and escape all statistical record. It is estimated that the amount thus used in India exclusive of the consumption of mills is equivalent to about 400,000 bales. Neglecting, however,
these quantities, which do not affect the world’s market, the
annual supplies of cotton are approximately as follows:

<table>
<thead>
<tr>
<th>Country</th>
<th>Approximate Production, Bales of 500 lb.</th>
<th>Percentage</th>
</tr>
</thead>
<tbody>
<tr>
<td>United States of America</td>
<td>11,000,000</td>
<td>68.75%</td>
</tr>
<tr>
<td>India</td>
<td>3,000,000</td>
<td>18.75%</td>

<td>1,000,000</td>
<td>6.25%</td>
</tr>
<tr>
<td><strong>Total</strong></td>
<td><strong>16,000,000</strong></td>
<td><strong>100.00%</strong></td>
</tr>
</tbody>
</table>

In 1905 the world’s crop closely approximated to 16,000,000 bales, whilst in 1904 it was nearly 19,000,000 bales and in 1906 nearly 20,000,000 bales. The United States produced very nearly
sevenths of the total “visible” cotton crop of the world. This, however, is quite a modern development, comparatively speaking. During the period from 1786 to 1790 the West Indies furnished about 70% of the British supply, the Mediter-
ranian countries 20%, and Brazil 8%; whilst the quantity
contributed by the United States and India was less than 1%, and
Egypt contributed none. In 1906 the United States contributed
65% of the commercial cotton, British India 19%, Egypt 7%, and
Russia 3%. Of the countries which were prominent in the
production of cotton in 1790, Brazil and Asiatic Turkey alone
remain (U.S.A. Bureau of the Census, Bulletin No.76). The actual figures for the chief countries for 1904-1906, taken
from the same source, are as follows:

<table>

This title serves to indicate the principal countries contributing to
the world’s supply of cotton. The following notes afford a
summary of the position of the industry in the more important
countries.

**United States of America.**—The cultivation of cotton as a staple
crop in the United States dates from about 1770, although
efforts appear to have been made in Virginia as far back as 1621.
The supplies continued to be small up to the end of the century.
In 1792 the quantity exported from the United States was only
1 It is related that in the year
1784 William Rathbone, an Ameri-
can merchant resident in Liver-
pool, received from one of his
 correspondents in the southern
states a consignment of eight bags of
 cotton, which on its arrival in
Liverpool was seized by the custom-
house officers, on the allegation that
it could not have been grown in
the United States, and that it was
liable to seizure under the Shipping
Acts, as not being imported in a
vessel belonging to the country of
its growth. When afterwards re-
leased, it lay for many months
unsold, in consequence of the ship-
ners doubting whether it could be
profitably worked up.

commercial crop was 5,755,539 bales. In 1899 the acreage had increased to 24,275,101 and the crop to 9,507,786 bales. In 1906 the total area was 28,686,000 acres and the crop 13,305,265 bales.

The preceding table gives the quantity, value and character of the crop for each of the cotton-growing states in 1906, as reported by the Bureau of the Census.

Mexico.—Cotton is extensively grown in Mexico, and large quantities are used for home consumption. The cultivation is of very old standing. Cortes in 1519 is said to have received cotton garments as presents from the natives of Yucatan, and to have found the Mexicans using cotton extensively for clothing. From 1500 to 1905 the crop was about 100,000 bales per annum; the whole is consumed in local mills, and cotton is imported also from the United States.

British West Indies.—The cotton-growing region in Brazil comprises a belt some 200 m. in width, in the north-eastern portion of the country, and a strip along the valley of the San Francisco, where a large amount of the present crop is produced. The cotton is known in commerce under the name of the place of export, e.g. Maceio, Peranambuco or Pernam, Ceåra, Rio Grande, &c. The export fluctuates greatly.

</table>

The total production in 1906 was estimated at about 275,000 bales, but only a portion was available for export, there being an increasing consumption in Brazil itself.

Peru.—Cotton is an important crop in Peru, where it has long been cultivated. Most of the crop is grown in the irrigated coastal valleys. With more water available, the output could be considerably increased, e.g. in the Piura district. "Rough Peruvian," the produce of one of the tree cottons, has a special use, as being rather harsh and wiry it is well adapted for mixing with wool. Egyptian cotton is also grown. The annual export is about 30,000 bales.

British West Indies.—Cotton was cultivated as a minor crop in parts of the West Indies as long ago as the 17th century, and at the opening of the 19th century the islands supplied about 70% of the cotton used in Great Britain. Greater profits obtained from sugar caused the industry to be abandoned, except in the small island of Carriacou. In 1900 the Imperial Department of Agriculture and private planters began experiments with the object of reintroducing the cultivation, owing to the decline in value of sugar. The department was actively assisted by the higher price than the corresponding grade of cotton from the Sea Islands themselves.

In 1902 the total area under cotton cultivation in the British West Indies was 500 acres. The industry made rapid progress. In 1903 it was 4,000; in 1904-1906 it was 12,200; and for 1906-1907 it was 18,166 acres. The table indicates the chief cotton-producing islands, the acreage in each, the yield, average value per pound and total value of the crop in 1905-1906.

The whole of this crop was Sea Island cotton, with the exception of the "Marie galante" grown in Carriacou. Marie galante is a harsh cotton of the Peruvian or Brazilian type. The low yield per acre in this island, and also the low value of the lint per lb compared with the Sea Island cotton, is clearly apparent.

In 1906-1907 the acreage was substantially increased in many of the islands, e.g. Barbados from 1,000 to 2,000; St Vincent 700 to 1,500; St Kitts and Anguilla 1,000 to 1,500 each; Antigua 700 to 1,800. In Jamaica, on the other hand, it was reduced from 1,500 to 300 acres.

Spain.—Cotton was formerly grown in southern Spain on an extensive scale, and as recently as during the American Civil War a crop of 800 bales was obtained. It is considered that with facilities for irrigation Andalusia could produce 150,000 bales annually. The former industry was abandoned as other crops became more remunerative. The government is encouraging recent efforts to re-establish the cultivation.

Malta.—Cotton has long been cultivated in Malta, but the acreage diminished from 1750 acres in 1899 to 670 acres in 1906. A considerable quantity of the production is spun and woven locally; e.g. in 1904 the export was equivalent to about 120 bales out of a total production of 330 bales, and in 1905 to 258 out of 338 bales (of 500 lb each).

Cyprus has a soil and climate suited to cotton, which was formerly grown here on a large scale. The rainfall is uncertain and low, however, never exceeding 40 in., and on the supply of water by irrigation the future of the industry mainly depends. The exports dwindled from 3600 bales in 1865 to 946 in 1905; great fluctuations occur, the export in 1904, for example, being only 258 bales. The cotton grown is rather short-stapled and goes mainly to Marseilles and Trieste. Some is used locally in the manufacture of cloth.

Egypt.—The position of Egypt as the third cotton-producing country of the world has already been pointed out, and the varieties grown and the mode of cultivation described. The introduction of the exotic varieties dates from the beginning of the 19th century. The industry was actively promoted by a Frenchman named Jumel, in the service of Mehmet Ali, from 1820 onwards with great success. The area under cotton is about 1,800,000 acres.

The Egyptian Sudan.—Egyptian cotton was cultivated in the Sudan to the extent of 21,758 acres in 1906 chiefly on non-irrigated land. The exports, however, are small, almost all the crop being used locally. The chief difficulties are the supply of water, labour and transport facilities. Lord Cromer in his report on the Sudan for 1906 remarks that: "There seems to be some reason for thinking that the future—or at all events the immediate future—of Sudan agriculture lies more in the direction of cultivating wheat and other cereals than in that of cultivating cotton."

West Africa.—Cotton has long been grown in the various countries on the west coast of Africa, gained by hand or by very primitive means, spun into yarn, and woven on simple looms into "country cloths"; these are often only a few inches wide, so that any large cloths have to be made by sewing the narrow strips together. These native cloths are exceedingly durable, and many of them are ornamented by using dyed yarns and in other ways.

---

1 Taken with some modifications from the Agricultural News (1907), vi. p. 38.
COTTON

Southern Nigeria (Lagos) and northern Nigeria are the most important cotton countries amongst the British possessions on the coast. From the former there has been an export trade for many years which fluctuates remarkably according to the demand. Northern Nigeria is the seat of a very large native cotton industry, to supply the demand for cotton robes for the Mahommedan races inhabiting the country. The province of Zaria alone is estimated to produce annually 30,000 to 40,000 bales, all of which is used locally. Northern Nigeria contributes to the cotton exported from Lagos. The country offers a fairly promising field for development, especially now that arrangements have been made for providing the necessary means of transport by the construction of the new railways. The profits obtained from ground-nuts (Arachis hypogea) in Gambia, gold mining in the Gold Coast, and from products of the oil palm (Elaeis guineensis) in the palm-oil belt serve to prevent much attention being given to cotton in these districts.

Nyassaland (British Central Africa).—The cultivation of cotton on a commercial scale is quite new in Nyassaland, and although general conditions of soil and climate appear favourable the question of transport is serious and labour is not abundant. The exports were equivalent to 2 bales of 500 lb. in 1902-1903, 11 bales in 1903-1904, 570 bales in 1904-1905, 1553 bales in 1905-1906, and 1052 bales in 1906-1907. In the lower river lands Egyptian cotton has been the most successful, whilst Upland cotton is more suited to the highlands.

British East Africa and Uganda.—In these adjoining protectorates wild cottons occur, and suitable conditions exist in certain localities. Experimental work has been carried on, and in 1904 Uganda exported about 43 bales of cotton, and British East Africa about 177 bales. In 1906 the combined exports had risen to 362 bales, including a little from German East Africa. In 1904-1905 there were some 300 acres under cotton in British East Africa. Lack of direct transport facilities is a difficulty. Some of the native cottons are of fair quality, but Egyptian cotton appears likely to be best suited for growing for export.

India is probably the most ancient cotton-growing country. For five centuries before the Christian era cotton was largely used in the domestic manufactures of India; and the clothing of the inhabitants then consisted, as now, chiefly of garments made from this vegetable product. More than two thousand years before Europe or England had conceived the idea of applying modern industry to the manufacture of cotton, India had matured a system of hand-spinning, weaving and dyeing which during that vast period received no recorded improvement. The people, though remarkable for their intelligence whilst Europe was in a state of barbarism, made no approximation to the mechanical operations of modern times, nor was the cultivation of cotton either improved or considerably extended. Possessing soil, climate and apparently all the requisite elements from nature for the production of cotton to an almost boundless extent, and of a

---

1 Approximately.

useful and acceptable quality, India for a long series of years did but little towards supplying the manufactures of other countries with the raw material which they required. Between the years 1788 and 1850 numerous attempts were made by the East India Company to improve the cultivation and to increase the supply of cotton in India, and botanists and American planters were engaged for the purpose. One great object of their experiments was to introduce and acclimatize exotic cottons. Bourbon, New Orleans, Upland, Georgia, Sea Island, Pernambuco, Egyptian, &c., were tried but with little permanent success. The results of these and similar attempts led to the conclusion that efforts to improve the indigenous cottons were most likely to be rewarded with success. Still more recently, however, experiments have been made to grow Egyptian cotton in Sindh with the help of irrigation. Abassi has given the best results, and the experiments have been so successful that in 1904-1905 an out-turn of not less than 100,000 bales "was prophesied in the course of a few years" (Report of Director, Land Records and Agriculture). The average annual production in India approximates to 3,000,000 bales. The area under cotton in all British India is about 20,000,000 acres, the crop being grown in a very primitive manner. The bulk of the cotton is of very short staple, about three-quarters of an inch, and is not well suited to the requirements of the English spinner, but very large mills specially fitted to deal with short-stapled cotton have been erected in India and consume about one-half the total crop. The remainder is exported to Germany and other European countries, Japan and China. In 1906 the United Kingdom took less than 5% of the cotton exported.

About 50% of the cotton produced is consumed in Indian mills and the remainder is exported.

China.—Cotton has not been cultivated in China from such early times as in India, and although cotton cloths are mentioned in early writings it was not until about A.D. 1300 that the plant was grown on any considerable scale. There are no figures obtainable as to the production, but it must be very large, considering that the crop provides clothing for a large proportion of the population of China. During recent years a considerable quantity of cotton has been exported, but more than a compensating amount of raw cotton, yarns and textiles, is imported. An estimate of the crop puts it at about 1,500,000 bales.

Korea is stated to have originally received its cotton plants from China some 500 years ago. Conditions are well adapted to the cultivation of the plant, and since the cessation of the Russo-Japanese War the Japanese have undertaken the development of the industry. Figures are difficult to obtain, but an official report from the Japanese Residency General in 1907 estimated the crop at about 214,000 bales, all being used locally. In the future Korea may become an important source of supply for Japan, especially if, as appears likely, Korea proves suited to the cultivation of American cotton.

Japan received cotton from India before China, and the plant is extensively grown, especially in West and Middle Japan. The production is not sufficient to meet the home demand, and during the five years of normal trade before the war with Russia Japan imported annually about 800,000 bales of cotton, chiefly from British India, China and the United States, and during the same period exported each year some 2000 bales, mainly to Korea.

Dutch East Indies.—In Java and other Dutch possessions in the East cotton is cultivated. A considerable amount is used locally, and during the six years ending in 1907 the surplus exported ranged from about 24,000 to 40,000 bales per annum.

Russia.—Some cotton is produced in European Russia in the southern Caucasus, but Turkestan in central Asia is by far the

---

more important source of Russian-grown cotton. In this region cotton has been cultivated from very early times to supply local demand, and so a minor degree for export. Since about 1875 the Russians have fostered the industry, introducing American Upland varieties, distributing seed free, importing gins, providing instruction, and guaranteeing the purchase of the crops. The Trans-Caspian railway has been an important factor; almost all the cotton exported passes over this line, and the statistics of this trade indicate the progress made. The shipments increased from 250,978 bales in 1896–1897 to 495,962 bales in 1901–1902—part, however, being Persian cotton. The production of cotton in Russia in 1906 was estimated at 675,000 bales of 450 lb each. About one-third of the cotton used in Russian mills is grown on Russian territory, the remainder coming chiefly from the United States.

Asia Minor.—Smyrna is the principal centre of cotton cultivation in this region. A native variety known as "Terli," and American cotton, are grown. The general conditions are favourable. According to the Liverpool Cotton Gazette, Asiatic Turkey produced in 1906 about 100,000 bales, and Persia about 47,000 bales. Cotton was formerly cultivated profitably in Palæstine.

Australasia.—The quantity of cotton now produced in Australasia is extremely small. Queensland, New South Wales and South Australia possess suitable climatic conditions, and in the first-named state the cotton has been grown on a commercial scale in past years, the crop in 1897 being about 450 bales. Considerable interest attaches to the "Caravonica" cotton raised in South Australia, which has been experimentally introduced in Australia, Ceylon and elsewhere. It is probably a hybrid between Sea Island and rough Peruvian cotton, but lacks most of the essential features of Sea Island.

In Fiji the cotton exported in the 'sixties and 'seventies was worth £5,000,000 annually; but the cultivation has been practically abandoned. In 1899 about 60 bales, and in 1900 about 6 bales, were exported. During 1901–1903 there were no exports of cotton, and in 1904 only 70 bales were sold out.

Into the Society Islands Sea Island cotton was introduced about 1860–1875. Up to the year 1885 there was an average yearly export equivalent to about 2140 bales of 500 lb, after which date the export practically ceased. The industry has, however, been revived, and in 1906 over 100 bales, valued at £1,052, were exported.

MARKETING AND SUPPLY

In the days of slave-grown cotton, the American planters, being men of wealth farming on a large scale, consigned the bulk of their produce as a rule direct to the ports. Now, however, a large proportion of the crop is sold to local store-keepers who transfer it to exporting firms in neighbouring cities. The cultivators, whether owners of the plantations, as is usual in some districts, or tenants, as is customary in others, are financed as a rule by commission agents. The decline of "spot" sales at the ports, partly but not entirely in consequence of the appearance of the small cultivator, has proceeded steadily. Hammond1 has constructed a table from information supplied by the secretaries of the cotton exchanges at New York, Charleston, Savannah, Mobile, New Orleans and Galveston, showing the sales of "spot" cotton at those ports for the twenty-two years between 1874–1875 and 1895–1896, and in all cases an absolute decline is evident. The receipts of cotton in the season 1904–1905 at the leading interior towns and ports of the United States are given below.

Receipts of Cotton at 28 Interior Towns.

Galveston and Savannah have risen considerably in relative importance of late years.

Before the Civil War each planter would have his own gin-house. Now, however, ginning is a distinct business, and one gin will serve on an average about thirty farmers. Moveable gins were tried for a time in some places; they were dragged by traction engines from farm to farm, like threshing machines in parts of England, but the plan proved uneconomical because, among other reasons, farmers were not prepared to meet the cost of providing facilities for storing their cotton. In addition to the small country ginneries, large modern ginneries have now been set up in all the leading Southern market towns. The cotton is pressed locally and afterwards "compressed" into a very small compass. The bales are usually square, but cylindrical bales are becoming more common, though their cost is greater. In the latter, the cotton is arranged in the form of a rolled sheet or "lap." Owing to complaints of the careless packing of American cotton, attention has been devoted of late to the improvement of the square bale.

London used to be the chief cotton port of England, but Liverpool had assumed undisputed leadership before the 19th century began. Some arrivals have been diverted to Manchester since the opening of the Manchester ship canal; shipments through the canal from the 1st of September to the 30th of August in each year for the decade 1894–1895 to 1904–1905 are appended—six to eight times as much is still unloaded at Liverpool.

A Manchester cotton-importing company was recently formed for increasing deliveries direct to Manchester, and establishing a "spot" market there, an end to which the Manchester Cotton Association had directed its efforts for some time past. The latter association was established at the end of 1804, with a membership of 265, in the interests of those spinners who desired importations direct to Manchester. The objects of the association are officially stated to be: (1) to frame suitable and authoritative forms of contract, and to make rules and regulations for the proper conduct of the trade; (2) to supervise and facilitate the delivery of the importations of cotton at the Manchester docks to the various consignees; (3) to provide and maintain trustworthy standards of classification; (4) to procure and disseminate useful information on all subjects pertaining to the trade; (5) to act in concert with chambers of commerce and other bodies throughout the world for mutual protection; (6) to establish a market for cotton at Manchester. Spinners and ginning members promote this, but almost all the Manchester cotton merchants and cotton brokers have also joined the association. The importance of the original spinners' representation on the association is shown by the fact that they worked over 14,000,000 spindles in December 1905 the spindles represented by members had risen to nearly 20,000,000. Some 73,000 looms are also represented. As most of the Lancashire cotton mills lie far from Manchester, direct importations to that city do not usually dispense with a "handling," and frequently save little or nothing in freight rates, though in some cases the economy derived from direct importation is considerable. One gain accruing to Lancashire from the
COTTON

COTTON, however, is that its competition has brought down railway rates.

Fundamental alterations have been made in the structure of the leading cotton markets, and in methods of buying and selling cotton, in the last hundred years. We shall not attempt to trace the changes as they appeared in every market of importance, but shall confine our attention to one only, and that perhaps the most important of all, namely, the market at Liverpool. This selection of one market for detailed examination does not rob our sketch of generality, as might at first be thought, since broadly the history of the development of one market is the history of the development of all, and on the whole the economic explanation of the evolution that has taken place may be universalized.

_Cotton landed at the Port of Manchester since the Canal was opened._

(In thousand Bales.)

The season is from the 1st of September to the 31st of August each year.

Originally cotton was imported by the Liverpool dealer as an agent for American firms or at his own risk, and then sold by private treaty, auction, or through brokers, to Manchester dealers, who retailed it to the spinners. This statement is, of course, only roughly correct. Some Manchester dealers imported themselves, and some spinners bought direct from Liverpool importers, but the rule was the arrangement first described. Early in the 19th century it became customary for Manchester dealers and Liverpool importers to carry on business with one another through representatives known as "buying" and "selling" brokers. About this time the broker of cotton only began to specialize from the ranks of the brokers who dealt in all kinds of colonial produce. Previously there had not been enough business done in cotton to make it worth any person’s while to devote himself to the buying and selling on commission of cotton only. The evolution of the distinct business of cotton broking is readily comprehensible when we remind ourselves that the requirements, as regards raw material, of all spinners are much alike generally, and that no spinner could afford to pay an expert to devote himself entirely to purchasing cotton for his mill.

So far change had been gradual, but the success of the Manchester and Liverpool railway undermined beyond repair the old system of doing business. Spinners could easily run over to Liverpool and buy their cotton from the large stocks displayed at that port. Before the railway was opened some spinners had been in the habit of making their purchases of raw material in Liverpool, but the great inconveniences of the journey, combined with less easy terms for payment than were usual in Manchester, prevented any great numbers from departing from the beaten track. Cotton dealers up to this time had regularly financed the spinners, who were frequently men of little capital, by allowing long credit, and had even employed them to spin on commission. As men of substance increased among the ranks of the spinners, the Manchester cotton dealers found it impossible to retard a movement set on foot by the prospects of such appreciable advantages. Ultimately many of the old Manchester cotton dealers became brokers for their old customers. In 1875 there were said to be upwards of 100 cotton dealers in Manchester, but from that time onward their members steadily declined. It is interesting to observe that a later development of transport between Manchester and Liverpool, namely, the Manchester Ship Canal, has drawn back into Manchester a part of the cotton market which was attracted from Manchester into Liverpool by the famous improvement in transport opened to the public three-quarters of a century ago.

The centralization of the cotton market in Liverpool fixed firmly the system of buying through brokers, for the Liverpool importer, or his broker, was in no sense a professional adviser to the spinners, informally pledged to advance the latter’s interests, as the old Manchester dealers had been. The system was rendered comparatively inexpensive by the drop in commissions from 1½ ½ % which had followed the adoption of selling by sample. This custom of buying and selling through brokers continued unshaken until the laying of the Atlantic cable tempted selling brokers occasionally, and even some buying brokers, to buy direct from American factors by telegraph and thus transform themselves into quasi-importers. The temptation was made the more difficult to resist by the development of “future” dealings. When the agents of the spinners, that is, the buying brokers, by becoming principals in some transactions, had acquired interests diametrically opposed to those of their customers, the consequent feeling of distrust among spinners gave birth to the Cotton Buying Company, which, constituted originally of twenty to thirty limited cotton-spinning companies, represents to-day nearly 6,000,000 spindles distributed among nearly one hundred firms. Its object was to squeeze out some middlemen and economize for its members on brokerage. This company, it is said, helped to attract the brokers back to the spinners, and an informal understanding was arrived at that the buying broker should not figure both as agent and principal in the same transaction.

¹ Commercial crop.
² A cantar is 99-05 lb avoirdupois.
By 1876 "forward" operations had become so vast and complicated that a cotton-clearing house had to be established to deal with the confusing networks of debits and credits created by them. Its principle was exactly that of the clearing houses used by the railways and the banks, the cancellation of indebtedness and discharge simply of balances. The final settlement of a "future" contract involved usually a crowd of persons, and the passage of large sums of money backwards and forwards, so that the amount of cash required for circulation on the exchange became unreasonably excessive and an annoying waste of time was entailed. The cotton-clearing house substituted book-keeping for the bulk of these payments. The establishment of the Cotton Bank naturally followed. Now debts are discharged in the first instance by vouchers.

Dealers pass their debit and credit vouchers into the Cotton Bank and pay or receive the balances which they owe or are entitled to. In order to protect dealers against the losses due to the insolvency of those with whom they have had transactions, weekly settlements on the exchange have been made compulsory; between brokers and their clients they are so also made. At the settlement, every member of the exchange receives the "differences" owing to him and pays those which he has incurred. Thus if a person holds futures for 10,000 bales which stood at £5-20 on the last settlement day and now stand at £5-30, and in the course of the previous week has sold 5000 bales of "futures" at £5-10, he receives 10,000 × £10/6d. on his old holding, and has to pay 5000 × £8/6d. on his sales, and therefore on balance neither receives nor pays. Differences may be very large sums. The unit of a "future" being 100 bales, an alteration in the price of cotton of 1d. causes a difference on each unit of £2. Periodic settlements are obviously periodic tests of the solvency of dealers. If the test of the settlement was not frequently applied, speculators who were unfortunate would be tempted to plunge deeper until finally some became insolvent for large sums. As it is, the speculator who has incurred losses beyond his means tends to be discovered before his creditors are heavily involved. Settlement days fall on Thursday, and the closing prices on the preceding Monday are taken as the basis of the settlement. From all differences interest at 5% is deducted for the time between settlement day and the tenth day of the second month on which the "future" elapses, since settlement terms mean that money is paid in instalments before it is actually due. To the admission of periodic settlements there was for a time vehement opposition on the ground that the door would be opened to gambling on "differences." Hence at first, in 1882, they were used only by a section of the market constituted of members who had voluntarily agreed to do business with one another upon these terms alone. By 1884 however, the advantages of "settlement terms" became so evident that they were adopted by the Cotton Association, at first for fortnightly periods, with the saving clause originally that they should not be compulsory. As soon as the clearing house was set up it became evident that "futures" were an impossibility away from it. At the same time "futures" were becoming an increasingly necessity to importers, because through "futures" alone could they hedge on their purchases of cotton, or buy when the market seemed favourable, and they were not prepared to assume heavy risks. Now from the clearing house importers were rigorously excluded, and on invoking the aid of "futures," therefore, they were penalized to the extent of double broker's commission, one commission being charged on the sale of the "futures" and one on their purchase back. The importers, therefore, found it necessary to establish a club of their own, the Liverpool Cotton Exchange, which they as rigorously guarded against brokers. The split in the market so caused was so damaging to both parties that a satisfactory arrangement was eventually agreed upon, and both institutions were absorbed in the Liverpool Cotton Association.

A condition of specialist dealers working to the public service is that they should not act in the dark. They must watch demand, be able to form reasonable anticipations of its move-
COTTON

The spinner’s risks.

Changes, and an attempt is made in each market to keep the grades as fixed as possible. But what it, may be inferred, is the value of “futures” relating to “middling” cotton to a buyer whose contracts with spinners are not in “middling” cotton? The answer is that though the ratios between the prices of the various grades alter, the prices of all of them move generally together, and that the “futures” of the Exchange at least provide a hedge against the latter movements. Other things being equal, the broker would be better off if he could hedge with equal ease against all his risks. But other things are not equal: the market would be more confusing and quotations would be complicated if “futures” were in use for all grades.

We may now examine the exchange “futures” in minute detail. They are quoted as a rule for about ten months ahead. Thus in January the futures quoted will be January (technically termed “current,” “present month” or “near month,” “futures”). January-February, February-March, March-April, April-May, May-June, June-July, July-August, and perhaps two or three more. Each group, it will be observed, except “current futures,” culminates in two defined months. The rule is that of the first of the two months the seller of “futures” may, and before the last day of the second month must, deliver cotton against them, or, what comes to the same thing, buy back the “futures” on the basis of the price of “spot” cotton of middling grade. Various grades of cotton are tenderable against “futures”; if this were not so “futures” would be in danger of defeating their object, because the price of the grade upon which they were founded would probably at times be thrown widely out of relation to the general level of prices in the cotton market. The lowest grade tenderable used to be “low middling,” but since October 1901, “middling” and deductions of price from those below. A sample is taken from each bale and the “points on or off” are fixed for each bale separately. If either party is dissatisfied with the award, he may appeal to an appeals committee On paying £3.5.0. which is refund to him by the other party if the appeal be upheld. The detailed arrangements described above are those of the Liverpool market. The great bulk of “futures,” however, are bought back and not delivered against.

Beneath are the official Liverpool quotations of “futures,” as they appeared on the morning of the 19th of April 1906—

Egyptian futures, it will be observed, run out in single months. As the cost of dealing in “futures” is only one shilling on each transaction for a member of the Cotton Exchange (the outsider is charged in addition a commission by his broker), it is not surprising that the transactions taking place in “futures” number legion.

The methods of dealing in cotton are very intricate, and it is necessary here to interpolate an explanation of the relations between the prices paid by spinners for cotton and the quoted "spot" prices. We begin by giving the official quotations of "spot," and statement of business done, published on the morning of the 19th of April 1906.

Purchases for "speculation" remain in the market and therefore figure again in the sales. These official prices are sometimes prices actually paid, and sometimes prices settled by

**Transactions of 100 bales only.**

Some spinners cover their yarn contracts merely by buying "futures," but the cover thus provided is frequently most inadequate owing to variations in the "points on or off" for the particular cotton that they want. For example, after the size of 1904–1905 crops became known, and the Americans attempted to hold back cotton, the "points on" for many qualities rose considerably owing to artificial scarcity, though the price of cotton, as indicated by "spot," remained low. There is a tendency for cautious spinners in England to run no risks and fix the prices of their yarn in accordance with quotations for actual cotton of specified qualities made by their brokers.

We now return to exchange "future" transactions regarded as a genus. In addition to "futures" proper there are "options" and "straddles." Options are single ("puts" or "calls") or double (that is, "straddles.") Options are single ("puts" or "calls") or double (that is, "straddles.") The "put" is a right to sell cotton within some specified time in the future at a price fixed in the present, which need not, of course, be exercised. The "call" is similar, but relates to buying. It will be evident that the "put" is a hedge against falls in the price, and the "call" a hedge against rising. The basis of "options" is the same as that of
ordinary "futures," *i.e.* middling American cotton of "no staple," &c. Whether the purchaser of an option gains or loses depends upon the price that he has paid in relation to the gain, if any, that he makes out of his power. The price of options of course varies: that of double options is always highest, but they are little used. A "straddle" is a speculation on the difference between the prices of nearer and more distant futures, which varies from time to time, or on the difference between the prices of different kinds of cotton. An example will make the nature of the straddle clear. Suppose a dealer buys April-May "futures" at 4d. a lb and sells the same quantity of May-June "futures" at 4½d. a lb. Then, whether prices rise or fall as a whole, he gains if the difference between the two prices becomes less than 4½d., but if it becomes more, he loses. On the other hand, had the dealer bought May-June at 4½d. and sold April-May at 4d. he would have gained in the event of the difference increasing, and lost in the event of its decreasing.

A question which has met with a good deal of attention is whether the speculation, which has been encouraged by the various arrangements made for facilitating operations in "futures," has steadied or unsteadied prices. Before we are prepared to answer this question we must be furnished with a precise conception of what is meant by "steadiness" in prices. It is sometimes assumed that this is measured perfectly by the standard deviation,[1] which is obtained by taking the squares of the differences between the average and the individual prices, summing them and extracting the square root. But obviously the information given by the standard deviation is limited: the frequency of movement cannot be inferred from it; two series might have quite different average oscillations and yet the same standard deviation; and the range of movement, or spread of the variations from the average price (though allowed for in the standard deviation more than in the average error), is hidden. Now, frequency of movement, average daily price variation, and range of price movements are of fundamental importance to the public. Hence for practical purposes we require several kinds of measurement of price movements, and it is impossible to weigh exactly the one against the other in respect of importance. Observe that an increase of the frequency of movement, or even of the average daily movement, is not necessarily objectionable, since changes are less harassing when they take place by small increments than when they are brought about by a few big variations. The difference between the highest and lowest price, we may observe, is a very imperfect indication of the range of movement (though, taken in conjunction with the standard deviation, it is the best at our disposal), because either of the extreme prices might be accidental and quite out of relation to all others. An investigator must be on his guard against using quotations of this kind. There is also a difficulty about the frequency of movement, because as a rule many movements take place in one day the total over a period sufficiently lengthy to yield general results is enormous, and many are unrecorded. In one day, for instance, when the net drop was 33 points and the range of variation 59 points (namely, 8-45 to 7-86), 1,500 price fluctuations were recorded. However, the count of frequency of movement from daily closing prices would probably afford a roughly satisfactory comparative measurement in markets in which prices sometimes remain the same for a day or two together. The points just noted apply also to the average fluctuation and the standard deviation, but it is probable in these cases that daily or even weekly quotations would be sufficient to yield the information sought for with sufficient exactness for purposes of comparison.

Now, supposing dealing to be confined to experts, what effects upon the course of prices would one expect from the speculation of the cotton market and improved facilities for dealing, on the assumption that dealers were governed wholly in their actions by the course of prices and never tried to manipulate them? The frequency of movement ought to increase because the market would become more sensitive, but, other things being equal, the range of movement ought to diminish, and ultimately the average daily movement also, though at first the latter might not fall appreciably if, indeed, it did not rise, owing to the increased frequency of movement. These results would prove beneficial to the community. May we infer deductively that they have been attained because of the increase of speculative transactions? By no means, and for two reasons. In the first place, the public speculates to a large extent on the cotton exchange, and its speculation (taken as a whole) is sheer gambling. But, it may be replied, the outsiders, being as a whole completely ignorant of the forces at work, so that they cannot form rational anticipations, cannot have any effect either way: by the law of chance their influences would neutralize one another. This would be so if people acted independently and without guidance, but actually they are sometimes misled by published advice and movements in the market intended to deceive them, and, even when they are not, they watch each other's attitudes and tend to act as a crowd. The mass becomes unduly sanguine or weakly surrenderers to panic. Hence the law of error does not apply, and speculation by the public may unsteady prices. Again, dealers sometimes try to create corners and form powerful syndicates for that purpose: the dealing syndicate of late years has become a force to be reckoned with. Many large-scale operations are entered into, not because prices are relatively high or low, but to make them high or low for ulterior purposes; *i.e.* the market is deliberately "bulled or beared." In consequence of this tampering with the market no certainty can be felt about the effect even of expert dealing.

What, then, we may profitably inquire next, has actually happened to price movements generally as the market has developed? This question can readily be answered as regards the past forty years or so, for which material has been collected, but the reader must bear in mind that if improvement can be traced it cannot logically be attributed unhesitatingly to the operating of this speculation, whereby a larger use has been made of "futures," since many other economic changes have taken place concomitantly and they may have wrought the major effect. The world may be steadying and steeling its nerves. Now, turning to the actual effects, we discover somewhat remarkable facts. Expressed both absolutely and as percentages of the price averaged from the 1st of October to the 31st of July, the range of movement, standard deviation, and mean weekly movement calculated between the times mentioned above (October 1st to July 31st), after diminishing significantly for some years after the later 'sixties, have risen appreciably on the whole of late years. The figures in the table below are from the *Journal of the Royal Statistical Society*, June 1906: quotations for August and September were omitted to avoid the transition movements between the price levels of two crops.

In this table measurements of price movements stated both absolutely and as percentages of price levels are given, because authorities have expressed doubts as to whether the former or the latter might be expected to remain constant, other things being equal, when price rose. On the one hand, it is argued that speculative are affected only by the absolute variations in price, while on the other hand it is contended that a movement of one "point," say, is less influential when the price is about 8d. than when it is about 4d. In response to the first view it might be argued that if speculators are influenced only by the differences for which they become liable, a "point" movement would have a somewhat slighter effect on their action, other things being equal, when price was high, because, supplies being relatively short, each of them would tend to be engaged in a smaller volume of transactions measured in quantity of cotton, than when supplies were larger. But the point need not be discussed further here, since both percentage and absolute indices of the fluctuations of late years. The explanation of this change in the direction of indices of steadiness cannot be proved to consist in any peculiarity in the supplies of recent years. But the dealing syndicate has probably been of late more common and more powerful—that is, the syndicate which exists to make profits out
of manipulating the market—and the public has probably been speculating increasingly. It is plausible, then, to suppose that the dealing syndicate primarily, and the speculations of the public secondarily (secondarily, because in all likelihood the effect of its operation would be much less in magnitude), may account for the change.

"Futures" are not used in all markets—for instance, they are not to be found at Bremen; and in those in which they are used they play parts of different prominence—at Havre, for instance, the transactions in "futures" are of incomparably less relative importance than they are at Liverpool. But it is futile to seek the effect of the magnitude of the market in "futures" in the differences between price movements in the various markets, because it is often in different ways—in Germany, for example, spinners buy to hold large stocks—and (2) the markets are in telegraphic communication, so that their price movements are kept parallel. Mr. Hooker has shown with reference to the wheat market how close is the correlation between prices in different places, and the same has been observed of the cotton market, though the

Conceivably some indication of the workings of "futures" might be gleaned from observation of the relations of near and distant "futures" to one another and of both to "spot." The complete explanation of changes in these relations is still a mystery. Probably an infinitude of subtle influences came into play, and among these there seems reason to include the intentional and unintentional "bulling" or "bearing" of the market. Some examples of the diverse relations to be found when all of the "futures" fall in the same crop year, may be quoted here—quotations running into the new crop year are obviously affected by anticipations of the new crop.

As we pass from the "future" of the month in which the quotation is made to the most distant "future" it will be observed that in the first and second cases price rises continuously, in the second case even passing "spot," whereas in the third case it falls first and then rises. Instances might be given of its falling uninterruptedly. It seems a plausible conjecture that if "futures" were "bulling" the market in the first case, they were at least "bulling" it less in the second case ceteris paribus, and probably

3. Attempts to explain them were made in an article in the *Economic Journal* in December 1904, and in the paper already referred to read by the Royal Statistical Society.
if the “futures” do “bear” and “bull,” as has been supposed, they probably influence these magnitudes. It might be thought that the “futures” of different months, being substitutes in proportion to their temporal proximity to one another, should vary together exactly; but it would seem to be a sufficient reply that as they are not perfect substitutes they are in some slight degree independent variables. The “spot” market might be judged generally as too high, in view of crops and the probable normal demand of the year, but it might not therefore drop immediately, owing partly to the pressure of demand that must be satisfied instantaneously. “Current futures” would be affected more than “spot” by this impression as to the relation of “spot” to a perceived normal price for the year, and they might therefore be expected to drop more than “spot” when this impression was at all widely entertained. But the fall of “current futures” would be checked by the demands that must be satisfied in the near future. Probably the prices of the more distant “futures” are determined in a higher degree by far-reaching imagination than the prices of nearer futures. This explains what has been called above the unintentional “bearing” of “spot” by “futures.” And it is immediately evident that the deliberate “bear” works by selling “futures,” and that the effect of his sales is propagated to “spot.” These statements are equally true of “bulling.” The influence of expectations of the new crop on “futures” running into the new crop is plain on inspection; but owing to the gap between the two crop years it would be astonishing if “futures” against which cotton from a new crop could be delivered were not appreciably independent of “spot” at the time of their quotation. However, it is noticeable that they are still so closely bound up with “futures” culminating in the old crop year that the daily movements of the former are closely correlated with those of the latter. Concluding cautiously, we may admit the probability of the relations between near and distant “futures” and “spot” (even in respect of “futures” running out in the same crop year) indicating sometimes at least the intentional or unintentional “bulling” or “bearing” or “spot” by “futures.” But nothing has yet been proved from these facts as to the effect “futures” are having upon the steadiness of prices. In the case of any crop year, if the relations which are suggested as indicating the “bulling” work of “futures” usually corresponded with “spot” prices being below the normal price of the crop year, or of what was left of the crop year, while the relations which are suggested to indicate the “bearing” work of “futures” on the whole corresponded with a relatively abnormal height of “spot,” it would be a legitimate inference that “futures” were tending to smooth prices. However, it is made clear as the result of an elaborate examination that the generality of these correspondences cannot be affirmed.1 The outcome of the whole matter is that the investigator is still baffled in his attempt to discover what effect the use of “futures” is having upon prices to-day. The sole piece of evidence, from which probable conclusions may be drawn, is that three separate measurements of price fluctuations over some forty years reveal a growing unsteadiness of late, whether they be expressed absolutely or as percentages of price.

The uneasiness caused by the excessive dependence of Great Britain upon the United States for cotton, coupled with the belief that shortages of supply are more frequent than they ought to be, and the fear that diminishing returns may operate in America, occasioned the formation in England of the British Cotton Growing Association on the 12th of June 1902. The proportions of England’s supplies drawn from different fields is indicated in the table below.

British dependence on American supplies is greater even than that of the continent of Europe, for Russia possesses some internal supplies, and more Indian cotton is used in continental countries than in England.

1 See the paper already mentioned in the Journal of the Royal Statistical Society for June 1906, where the several points noticed briefly above are fully discussed.

### Average Quantities of Raw Cotton imported Annually into the United Kingdom from the following Countries in the Periods 1896-1900 and 1901-1904.

The annual average shipments from Bombay to the European continent and to Great Britain in 1900-1904 were as follows:-

- To the continent | 600 bales of 31 cwt. |
- To Great Britain | 50 |

At the end of the 18th century the bulk of British cotton was obtained from the West Indies. Approximately the supplies were as follows in million lb:-

- British West Indies | 6-6 |
- French and Spanish settlements | 6 |
- Dutch settlements | 1-7 |
- Portuguese | 2-5 |
- East Indies | 1 |
- Smyrna or Turkey | 5-7 |

The British Cotton Growing Association works under the sanction of a royal charter and has met with valuable official support. Financial assistance and assurances as to sales and prices have been given liberally by the association where they are needed; ginning and buying centres have been established; experts have been engaged to distribute seed and afford instruction; and some land has been acquired for working under the direct management of the association. The governments of some colonies have aided the efforts of the association. Professor Wyndham Dunstan of the Imperial Institute, on a reference from the government, made favourable reports as to the possibilities of extending cotton cultivation. The results may be seen in the approximate estimates below of cotton grown more or less directly under the auspices of the association.

In the West Indies results are most favourable, both as regards quantity and quality of the crops. West Indian grown cotton has realized even higher prices than American grown Sea Island. In West Africa also prospects appear encouraging. In Sierra Leone little success has been met with, but on the Gold Coast some cotton better than middling American has been grown, and the association has concluded an agreement with the government for an extension of its work. In Lagos crops increased rapidly. The cotton is almost entirely grown by natives in small patches round their villages, and generally it
has sold for about the same price as middling American, though some of it realized as much as 25 to 30 "points on." The quality in greatest demand in England, it should be observed, is worth about ¼d. to ¼d. per lb. above middling American. In Southern Nigeria the association has met with only slight success; in Northern Nigeria, a working arrangement was entered into with the Niger Company, and a small ginning establishment was set to work in February 1906. In British Central Africa, the results on the whole have not been satisfactory. Though planters who confined their efforts to the lower lying grounds—of which there is a fairly large tract—succeeded, all the cotton planted on the highlands proved more or less a failure. In Uganda the association took no steps, but activity in cotton-growing is not unknown, and some good cotton is being produced. Arrangements were concluded with the British South Africa Company for the formation of a small syndicate for working in Rhodesia.

The general movement for the extension of cotton cultivation was welcomed by the International Congress of representatives of master cotton spinners and manufacturers’ associations at the meeting at Zurich in May 1904. It placed on record "its cordial appreciation of the efforts of those governments and institutions which have already supported cotton-growing in their respective colonies." England is pre-eminent but not alone in the matter. Germany and France, and in a less degree Belgium, Portugal and Italy, have taken some steps. Russia, too, is developing her internal supplies.

The advantages that might accrue from the wider distribution of cotton-growing are mainly fourfold. (1) Greater elasticity of supply might be caused. It is probably easier to extend the area under cotton rapidly when crops are raised from many places in proximity to other crops than when the mass of the cotton is obtained from a few highly specialized districts. Possibly the advantages of specialization might be retained and yet the elasticity of supply be enhanced. (2) Greater stability of crops in proportion to area cultivated is hoped for. The eggs are now too much in one basket, and local disease, or bad weather, or some other misfortune, may diminish by serious percentages the supplies anticipated. Were there numerous important centres the bad fortune of one would be more adequately offset by the good fortune of another. (3) Desirable variations in the raw material might conceivably eventuate from the introduction of cotton to spots in the globe where its growth was previously unknown or little regarded. The results of the enterprise of Mehmet Ali and Jumel in Egypt prove such an idea to be not altogether fanciful, and warn us also against hastily arguing that the plan is too artificial to succeed on a large scale. Without the active intervention of a strong body of interested parties it is sometimes unlikely that new industries will be undertaken even in places well suited for them. (4) Lastly, the countries to which cotton-growing is carried should gain in prosperity.

The general difficulties in the way of the British Cotton Growing Association are many and will be sufficiently evident. Lessons of value may be learnt from the fate of similar work undertaken by the Cotton Supply Association, which was instituted in April 1857. According to its fifth report, it originated "in the prospective fears of a portion of the trade that some dire calamity must inevitably, sooner or later, overtake the cotton manufacture of Lancashire, whose vast superstructure had so long rested upon the treacherous foundation of restricted slave labour as the main source of supply for its raw material." Its methods were stated to be: "To afford information to every country capable of producing cotton, both by the diffusion of printed directions for its cultivation, and sending competent teachers of cotton planting and cleaning, and by direct communication with Christian missionaries whose aid and cooperation it solicits; to supply, gratuitously, in the first instance, the best seeds to natives in every part of the world who are willing to receive them; to give prizes for the extended cultivation of cotton; and to lend gins and improved machines for cleaning and preparing cotton." Though the association brought about an extension and improvement of the Indian crop, in which result it was enormously assisted by the high prices consequent upon the American Civil War, it sank after a few years into obscurity, and soon passed out of existence altogether, while the effects of its work dwindled finally into insignificance. Much the same had been the ultimate outcome of the spasmodic attempt of the British government to bring about the introduction of cotton to new districts, after it had been pressed to take some action a few years prior to the formation of the Cotton Supply Association.

A Mr Clegg, who afterwards interested himself keenly in the activities of the Cotton Supply Association reported that in the course of a tour in 1855 through the Eastern countries bordering on the Mediterranean he had found none of the gins presented by the British government at work or workable.

BIBLIOGRAPHY.—On the question of cotton supplies, as treated in this article, the reader may be referred to Brook’s Cotton, Its Uses, &c. : Dabney’s Cotton Plant (Department of Agriculture of the United States); Foadden’s Cotton Culture in Egypt; Dunstan’s Report on Cotton Cultivation for the British government; Oppell’s Die Baumwollkultur (Berlin); Leconte’s Le Cotonnier (Paris); the official reports of the British Cotton Growing Association; Report of the Lancashire Commission on the possibility of extending cotton cultivation in the Southern States of North America; Watt’s Lancashire and the Cotton Famine; publications of the old Cotton Supply Association (many indexes of which are to be found in the Manchester public library); the volume marked "257 I. C. II.", including their weekly paper, The Cotton Supply Reporter; Hammond’s Cotton Culture and Trade. On methods of marketing to certain portions of the above must be added: Ellison’s Cotton Trade of Great Britain; Chapman’s Lancashire Cotton Industry (chap. viii.); articles by Chapman and Knoop in the Economic Journal (December, 1904) and the Journal of the Royal Statistical Society (April, 1906); Emery’s Speculation on Stock and Produce Exchanges of the United States (New York, 1898) and Budolfi’s Atlas of the Cotton districts will be found in the works mentioned, and these may be supplemented from the trade publications of different countries. Many valuable figures of cotton imports, &c., in early years will be found in Baines’ History of Cotton (London, 1816). There are two reports of the cotton trade published annually in the two publications, Shepperson’s Cotton Facts and Jones’s Handbook for Daily Cable Records of Cotton Crop Statistics. For current information the following may be added: News, Cotton’s and Tattersall’s circulars; Cotton (the publication of the Manchester Cotton Association); and daily reports and articles in the local press. Price curves are published by Messrs Turner, Routledge & Co.

COTTON GOODS AND YARN

The two great sections of the cotton industry are yarn and cloth, and in Great Britain the production of both of these is mainly in South Lancashire, though the area extends to parts of Cheshire, Yorkshire, and Derbyshire, and there is a Scottish branch, besides certain isolated ventures in other parts of the country. Though there are local rivalries there is nothing in competitive division to compare with the northern and southern sections in America, and the British industry is, for its size, more homogeneous than most of the European industries. Both operatives and employers are highly organized and both parties are able to make articulate contribution to the solution of the vexed problems of cotton. To the Cotton Supply Association; and daily reports and articles in the local press. Price curves are published by Messrs Turner, Routledge & Co.

Cotton Yarn.—The yarn trade is mainly in the hands of limited companies, and a private firm is looked upon as something of a survival from the past. The two great centres of production are Oldham, in which American cotton is chiefly, though not exclusively, spun, and Bolton, which spins the finer counts from Egyptian or Sea Island cotton. Spinning mills are established, however, in most of the large Lancashire towns as well as in some parts of Cheshire and in Yorkshire, where there is a considerable industry in doubling yarns. The centre of trade is the Manchester Royal Exchange, and though some companies or firms prefer to do business by means of their own salaried salesmen, managers or directors, most of the yarn is sold by agents. Frequently a single agent has the consignment of the whole of a company’s yarn, but many spinners, especially those whose business connexion is not perfectly assured, prefer to have more outlets than can be explored by an individual. At times of bad trade even those who usually depend on their own resources seek the aid of experienced agents, who sometimes find a grievance if their
services are rejected when trade improves and sales are made easily.

Yarn is sold upon various terms, but a regular custom in the home trade is for the spinner to allow 4% discount, for payment in 14 days, of which 2½ goes to the buyer, who is commonly a manufacturer, and 1½ to the agent for sale and guaranteeing the account. In selling yarn for export it is usual to allow the buyer only 1½% for payment in 14 days, or in some cases the discount is at the rate of 5% per annum for 3 months, which is equivalent to 15%.

The great bulk of the yarn spun in Great Britain ranges between comparatively narrow limits of count, and such staples as 32* to 36* twist and 36* to 40* weft in American, 50* to 60* twist and 42* to 62* weft in Egyptian, make up a large part of the total. It is nevertheless the experience of yarn salesmen that Lancashire produces an increasingly large amount of specialities that indicate a continued differentiation in trade. The tendency to spin finer counts has been less noticeable than the development of the flannelette trade, for which heavy counts are used, and there has been again a tendency lately to use "condenser" or waste wefts, which has worked to the disadvantage of the spinners of the regular coarse counts spun at Ruyton and elsewhere. The demand for cloths which require careful handling and regularity in weaving has helped to develop the supply of ring yarns which will stand the strain of the loom better than mule twists. A great amount of doubled and trebled yarn is now sold, though it does not appear that recent expansions have added much to doubling spindles, and considerable developments continue in the use of dyed and mercerized yarns.

Yarns are sold according to their "actual" counts, though when they are woven into cloth they frequently attain nominal or brevet rank. There has been a long-continued discussion, which between buyer and seller sometimes degenerates into a dispute, on the subject of moisture in yarns and the difficulty is not confined to the Lancashire industry. The amount permissible, according to the recommendation of the Manchester Chamber of Commerce, is 8%, but while it may be assumed that yarns at the time of their sale rarely contain less than this, they frequently contain a good deal more. It is a matter of experience that cotton yarns which when spun contain only a small percentage of moisture will absorb up to about 8% when they are exposed to what may be rather vaguely described as natural conditions. The exigencies of competition prompted the discovery that if yarn were sold by weight fresh from the spindle its comparative dryness made such early sale less probable than it was allowed the "condition," between loss and delay the spinner found an obvious alternative in damping the yarn artificially. As it was often clearly to the advantage of the buyer that he should receive immediate delivery he did not object to water in moderation, but art soon began to run a little ahead of nature. The essentially dishonest practice of deluging yarn with water, which has sometimes even degenerated into the use of weighting materials deleterious to weaving, has been recognized as a great nuisance, but while various attempts have been made to protect the buyer the question seems to have pretty well settled itself on the principles which commonly rule the sales of commodities between those who intend to do business continuously. The spinner who persists in over-weighting his yarn finds it difficult to obtain "repeat" orders.

A remarkable point in the Lancashire yarn trade is the looseness of the contracts between spinner and manufacturer. Doubtless some kind of sale note or acknowledgment usually passes between them, but in the home trade at least it is quite usual to leave the question of delivery an open one. It would not be correct to say that this system or want of system is satisfactory, but the trade manages to rub along very well with it, although inconveniences and disagreements sometimes arise when prices have advanced or declined considerably. Thus when prices have advanced the manufacturer may find it difficult to obtain delivery of the yarn that he had bought at low rates, for some spinners have a curious, indefensible preference for delivering their higher-priced orders; and, on the other hand, when prices have fallen the manufacturer sometimes ceases to take delivery of the high-priced yarn and actually purchases a little for his needs. Yet positive repudiation is very rare though compromises are not uncommon, and a good many illogical arrangements are made that imply forbearance and amity. Litigation in the yarn trade is very unusual, and Lancashire traders generally have only vague notions of the bearing of law upon their transactions, and a wholesome dread of the experience that would lead to better knowledge.

The average yearly values of the exports of cotton, yarn and cloth from Great Britain for the decades 1861-1890 and 1891-1900 respectively, are given by Professor Chapman in his Cotton Industry and Trade, in million pounds:

During the earlier decade the prices of cotton were comparatively high and the whole of the cloth exports represent, of course, a corresponding home trade in yarns. The following table, taken from the Manchester Guardian, gives in thousands of lb. the amounts of cotton yarn exported from Great Britain during 1903, 1904 and 1905 respectively, according to the Board of Trade returns, together with the average price per lb for each of the countries:

It should be understood, however, that in some cases the Board of Trade figures represent only an approximation to the ultimate distribution of the goods, as the exports are sometimes assigned to the intermediate countries, and in particular to Hong Kong, which is a considerable part of the yarn sent to the Netherlands is destined for Germany or Austria. The large business done in yarns with the continent of Europe is in some respects an extension of the British home trade, though certain countries have their own specialities. A considerable business is done with European countries in doubled yarns and in fine counts of Egyptian, including 'gassed' yarns, which are also sent intermittently to Japan. Extra hard yarns are sent to India and other near Eastern markets, and Russia, whose average price indicates, buys sparingly of very fine yarns. The trade with the Far East, which, though not very large for any one market, is important in the aggregate, is a good deal specialized, and since the

1 000 omitted.
development of Indian and Japanese cotton mills some of the trade in the cotton markets has been lost. The various Indian markets take largely of 40 mule twist and in various proportions of 30 mule, water twists, two-folds grey and bleached, fine Egyptian counts and dyed yarns. China also takes 40 mule, water twists and two-fold. The general export of yarn varies according to influences such as tariff charges, spinning and manufacturing development in the importing countries and the price of cotton. A particular effect of high-priced piece-goods is seen in various Eastern countries that are still partly dependent on an indigenous hand-loom industry. The big price of imported cotton throws the native consumer to some extent upon the local goods, and so stimulates the imports of yarn. It appears that as the native industries decline the weaving section persists longer than the spinning section.

Cotton Goods.—Cotton goods are of an infinite variety, and the titles that experience or fancy have evoked are even more numerous than the kinds. Descriptions of the following fabrics, which are not of course invariably made of cotton, will be found in separate articles: Baize, Bandana, Bombazine, Brocade, Calico, Cambric, Canvas, Chintz, Corduroy, Crape, Cretonne, Denim, Dimity, Drill, Duck, Flannelette, Fustian, Gauze, Gingham, Jacquard, Moleskin, Mull, Muslin, Nankeen, Print, Rip, Ticking, Twill, Velveteen.

The following are descriptions of an other variety. Grey cloth is a comprehensive term that includes unbleached cotton. A large proportion of the Lancashire export trade is in grey goods and a smaller yet considerable proportion of the home trade. Shirting, which has long since ceased to refer exclusively to shirt cloths, includes a large proportion of Lancashire manufacture. Grey and white shirtings are exported to all the principal Eastern markets and also to Near Eastern, European, South American, &c. markets. Certain staple kinds, such as 36 in. 3½ yd. 8 lb., 16 x 15 (threads to the i in.), largely exported to China and India, are made in various localities and by many manufacturers. The length quoted is to some extent a conventional term, as the pieces in many cases actually measure considerably more. The export shirting trade is done mainly on "repeat" orders for well-known "chops" or marks. These trade marks are sometimes the property of the manufacturer, but more commonly they are put upon the export goods. Generally the China markets use better qualities than the Indian markets. The principal China market for shirtings and other staple goods is Shanghai, which holds a large stock and distributes to minor markets. A considerable trade is also done through Hong-Kong and other Far Eastern ports. The principal Indian markets are Calcutta, Bombay, Karachi and Madras.

Shirt-cloth is the term more commonly applied to what is actually used in the manufacture of shirts, and it may be used for either plain or fancy goods.

Sheeting has two meanings in the cotton trade: (1) the ordinary bed sheeting, usually a stout cloth of anything from 45 in. to 120 in. wide (the extremes being used on the one hand for children's cot or ship bunks and on the other for old-fashioned four-posters), which may be either plain or twilled, bleached, unbleached or half-bleached; (2) a grey calico, heavier than a shirting, sent largely to China and other markets, usually 36 in. by 40 yd. and weighing about 12 lb. American sheetings compete with Lancashire goods in the China market. The Calico is a kind of heavy sheeting, and for the Levant market the name as a kind of sheeting is said to be the exclusive property of an American firm, although the general class is known by the name and supplied by other firms.

Mexico is a plain, heavy grey calico, sometimes heavily sized. The origin of the word is doubtful, and it seems to be an arbitrary term. Mexicans are exported to various markets and also used in the home trade. For export the dimensions are commonly 32 or 36 in. by 24 yd., and a usual count is 18 x 18. In the Mexican the yarns were originally of nearly the same weight and number of threads to the i in., an arrangement which gave the cloth an even appearance, thus differing from the "pin-head" or medium makes. Now, however, Mexicans are often made with lighter wefts, though the name is usually applied to the better class of cloths of the particular character. Punjoom is a Mexican, generally 36 yd. in length, sent mainly to the South African market.

T Cloth is a plain grey calico, similar in kind to the Mexican and exported to the same markets. There is no absolute distinction between the two cloths, but the T cloth is generally of better quality than the Mexican. The name seems to have been originally an arbitrary identification or trade mark.

Domestic a name originally used in the sense of "home-made," is applied especially to home-made cotton goods in the United States. In Great Britain it is employed rather loosely, but commonly to describe the kind of cloth which if exported would be called a Mexican. It may be either bleached or unbleached.

Medium is a plain calico, grey or bleached, of medium weight, used principally in the home and colonial trade. The word is sometimes particularly applied to cloths with a comparatively heavy weft, the distinction being made between the even Mexican make and the "pin-head" or "medium-make.

Raising-cloths are of various kinds and may be merely plain calico, or a calico, or a Condenser" weft made from waste yarns. The essence of the raising-cloth is a weft that will provide plenty of nap and yet have sufficient fibre to maintain the strength of the web.

Wigan is a name derived from the town Wigan and seems to have been originally applied to a stiff canvas-like cloth used for lining skirts. Now it is commonly applied to medium or heavy makes of calico.

Double-warp, as its name implies, is a cloth with a twofold warp. It is usually a strong serviceable material and may be either twilled or plain. Sheetings for home trade are often double-warp, and double-warp twills and Wigans were and are used for the old-fashioned type of men's night-shirts.

Croydon, which seems to be an arbitrary trade name, is a heavy, bleached, plain calico, usually stiff and glossy in finish. It was sold largely in the Irish trade as well as in the English home trade, but it has been supplanted a good deal by softer finishes.

Printed-cloth is a term with a general signification, but it is also particularly applied to a class of plain cloths in which a very large trade is done both for home trade and export. The chief place in Lancashire for the manufacture of printed-cloths is Burnley, and in the United States, Fall River. The Burnely cloths range in width from 20 in. to 40 in., and are usually about 150 yd. in length. The warp is commonly from 36 to 44, the weft from 36 to 54, and the threads from 13 x 12 to 20 x 20. In Cheshire printers, which are made at Hyde, Stockport, Glossop and elsewhere, are commonly 34 in. to 36 in. wide, the warp is from 32 to 36, the weft 32 to 40, and the counts 16 x 16 to 16 x 22.

Jacquem is understood to be the corruption of an Indian name, and the first jacquets were probably of Indian origin. They now make one of the principal staple trades of Lancashire with India. The Jacquet is a plain cloth, lighter than a shirting and heavier than a muslin. When bleached it is usually put into a firm and glossy finish. A 'Jacquem' is a jacquet bleached and finished soft. It also goes largely to India.

Dhookee is a name taken from a Hindu word of similar sound and referred originally to the loin-cloth worn by Hindus. It is a light, narrow calico made with a coloured back, which is often so elaborate as to require a dobbi loom for its manufacture. The finer kinds, made from Egyptian yarns, are called musl-boothies. The dhookee is one of the principal staples for India and is exported both white and grey.

Scarf is a kind of dhookee made usually with a taped or corded border.

Madoorom or Madooroom is a name derived from a suburb of Narasapur in the Madras presidency where the cloth was first made. It is now exported grey or white to India and other countries. In weight it is lighter than a shirting, and it is usually ornamented with a distinctive coloured heading.

Balti, probably of Persian derivation, and originally a fine cloth, is now a coarse and cheap cloth exported especially to Africa.
Sarong, the Malay word for a garment wrapped round the lower part of the body and used by both men and women, is now applied to plain or printed cloths exported to the Indian or Eastern Archipelago for this purpose.

Jean, said to be derived from Genoa where a kind of fustian with this title was made, is a kind of twilled cloth. The cloth is woven "one end up and two ends down," and as there are more picks of weft per inch than ends of warp, the diagonal lines pass from selvage to selvage at an angle of less than 45 degrees. The weft surface is the face or wearing surface of the cloth. Jeans are exported to China and other markets, and are also used in the home trade. *Jeuette* is the converse of jean, being a twill of "two ends up to one down"; the diagonal passes from selvage to selvage at a greater angle than 45 degrees and the warp makes the wearing surface.

*Oxford* is a plain-woven cloth usually with a coloured pattern, and is used for shirts and dresses. The name is comparatively modern, and is, no doubt, arbitrarily selected.

*Harrow* is a twilled cloth similar to the Oxford.

*Regatta* is a stout, coloured shirt cloth similar in make to a jeanette. It was originally made in blue and white stripes and was used largely and is still used for men's shirts.

Fancy cotton goods are of great variety, and many of them have trade names that are used temporarily or occasionally. Apart from the large class of brocaded cloths made in Jacquard looms there are innumerable simpler kinds, including stripes and checks of various descriptions, such as Swiss, Cord, Satin, Doria stripes, &c. *Mercerized cloths* are of many kinds, as the mercerizing process can be applied to almost anything. *Lace and lace curtains* are made largely at Nottingham. Various light goods are made in Scotland, such as *book muslin*, a fine light muslin with an elastic finish, so called from being folded in book-form.

Among the fancy cloths made in cotton may be mentioned: *calico*, which includes various kinds with some similarity in appearance to a matting texture; *mateless*, which is in some degree an imitation of French dress goods of that name; *pique*, also of French origin, woven in stripes in relief, which cross the width of the piece, and usually finished stiff; *Bedford cord*, a cheaper variety of pique in which the stripes run the length of the piece; *oatmeal cloth*, which has an irregular surface suggesting the grain of oatmeal, commonly dyed cream colour; *crimp cloth*, in which a puckered effect is obtained by uneven shrinkage; *gremadine*, said to be derived from Granada, a light dress material originally made of silk or silk and wool; *brilliant*, a dress material, usually with a small raised pattern; *leno*, possibly a corrupt form of the French *linon*, a kind of fancy gauze used for veils, curtains, &c.; *lappet*, a light material with a figure or pattern produced on the surface of the cloth by needles placed in a slanting frame; *baste*, a light dress material with a lustrous face sometimes made with a cotton warp and woolen weft; *sefiora*, a light, coloured dress material usually in small patterns; *bobbinet*, a machine-made fabric, originally an imitation of lace made with bobbins on a pillow.

Some fancy cloths have descriptive names such as *herringbone stripe*, and there are many arbitrary trade names, such as *Yosemite stripe*, which may prevail and become the designation of a regular class or die after a few seasons.

Cotton linings include *silesia*, originally a linen cloth made in Silesia and now usually a twilled cotton cloth which is dyed various colours; *Italian cloth*, a kind of jean or sateen produced originally in Italy. Various cotton cloths are imitations of other textures and have modified names which indicate their superficial character, frequently produced by finishing processes. Among these are *sateen*, which, dyed or printed, is largely used for dresses, linings, upholstery, &c.; *linette*, dyed and finished to imitate coloured linen in the north of Ireland and elsewhere; *hollandette*, usually unbleached or half-bleached and finished to imitate linen holland; and *interlining*, a coarse, plain white calico used as padding for linen collars.

Various cotton imitations share the name of the original, such as lawn, batiste, serge, huckaback, galloon, and a large number of names are of obvious derivation and use, such as umbrella cloth, apron cloth, sail cloth, book-binding cloth, shroud cloth.

Transactions with distant markets are now done almost entirely by cable, and a remarkable development of the telegraphic code has enabled merchants to pack a good deal into a brief message. A cable sent to India in the evening may bring a reply next morning, and in these days of rapid cotton fluctuations mail advices are confined mainly to general discussion, hypothetical inquiry, advice, admonition and complaint. Some Manchester export business is done through London, Glasgow, and continental towns, of which Hamburg is the principal. Glasgow buys largely of yarns and cloth, some considerable part of which is dyed or printed, for India and elsewhere, and has an indigenous manufacture and trade in fine goods such as book-muslins and lappets, a somewhat delicate department of manufacture which necessitates a slower running of machinery than is usual in Lancashire.

Besides the indent business there is, of course, purely merchant business by Manchester exporters, who buy on their own initiative at what they consider to be opportune times or on recommendations from their houses or correspondents abroad. In the Indian trade, especially in the Calcutta trade, a large proportion of the total amount is done by a few houses who buy in this way, and there is some difference of opinion as to whether the method, which had fallen out of fashion, may not further develop. It is more speculative than the indent business, but the dealing with large quantities which it involves gives the opportunity to buy very cheaply. A good many firms venture occasionally to buy in anticipation of their customers' needs, especially when they expect a rising market. During the great trade "boom" of 1905 there was a good deal of buying by exporters in advance of their indents because manufacturers continued to contract engagements which threatened to exclude dilatory buyers. On the whole, however, what may be called the speculative centre of gravity of Great Britain's export business in cotton goods is not in Manchester but abroad.

The terms on which business is conducted are various even in a single market, and it is sometimes a reproach that British firms are old-fashioned in their reluctance to give credit. The so-called enterprise methods of some German traders are, however, condemned by many experienced English traders, and it is said that in China, for instance, the seeming successes of the newcomers are delusive. The Tientsin developments of German business on credit terms are said to have proved unsatisfactory, and heavy losses were suffered in Hong-Kong some years ago by merchants who endeavoured to initiate a bolder system of trading. The very common complaint of British consuls that British firms neglect to send out travellers may have some foundation, but a commercial house naturally follows the line of least resistance to the development of its trade, and cannot be expected to work remote and barren ground when better opportunities are near at hand. On the whole it appears that the British cotton trade continues to increase to a satisfactory degree in fancy and special goods, which require for their production a comparatively high degree of technical skill, and are more lucrative than some of the simpler products in which competitors have been most forceful. In the various spinning processes, and particularly the mercerizing of yarn and cloth, have increased the possibilities in cotton materials, and while staples still form the bulk of our foreign trade, it seems that as the stress of competition in these grows acute, more and more of our energy may be transferred to the production of goods which appeal to a growing taste or fancy.

British Home Trade.—The home trade in cotton cloths is a great and important section, but it is not comparable in volume to the export trade. It involves more numerous and more elaborate processes, and the qualities for home use are generally finer and more costly than those for export. Of course by far the larger part of the yarn spun in Lancashire is woven in Lancashire, but of the cotton cloth woven in Lancashire it is roughly estimated that about 20% is used in Great Britain. Not only is the average of quality better, but the variety of kinds and designs is greater in the home trade than in the export trade. A good home trade connexion is considered an extremely valuable asset, and as the trade is highly differentiated the profits are usually good. Some manufacturers devote themselves exclusively to the home trade,

butter cloth, mosquito netting, handkerchief, blanket, towelling, bagging.

Among the miscellaneous cloths made or made partly of cotton may be mentioned: waste cloths, made from waste yarns and usually coarse in texture; kholki cloth, made largely for military clothing in cotton as well as woollen; cottonade, a name given to various coarse low cloths in the United States and elsewhere; lasting, which seems to be an abbreviation of "lastling cloth," a stiff, durable texture used in making shoes, &c.; bolting cloth, used in bolting or sifting; brattic cloth, a stout, tarred cloth made of cotton or wool and used for bracticing or lining the sides of shafts in mines; sponge cloths, used for cleaning machinery; shoddy and mengo, which though mainly woollen have frequently a cotton admixture; and splits, either plain or fancy, usually of low quality, which include any cloth woven two or three in the breadth of the loom and "split" into the necessary width. Cotton is used too for many miscellaneous purposes, including the manufacture of lamp wicks and even of billiard balls.

British Cotton Cloth Exports.—The main lines of the Lancashire export trade in cotton goods are indicated in the Board of Trade returns. The table on p. 278 compiled from them is taken from the Manchester Guardian. It gives in thousands of yards the quantities of cotton goods exported from Great Britain during 1903, 1904 and 1905 respectively, together with average value per yard for each of the countries.

The following table gives, approximately, in thousands of yards the quantities exported of the four main divisions of cotton cloths:

In the case of cloth, of course, the Board of Trade returns must not be taken as absolutely accurate records of imports to the particular countries, as the ultimate recipient is not always determined. The development of the Eastern trade has been one of the most remarkable features of the cotton trade in the 19th century. Professor Chapman writes in his Cotton Industry and Trade: "In 1820 Europe received about half the cotton fabrics which were sent abroad, while the United States received nearly one-tenth and eastern Asia little more than one-twentieth. By 1880 Europe was taking less than one-twelfth, the United States less than one-fiftieth, and eastern Asia more than a half."

Naturally a trade tends to find out the most direct means of distribution, and Manchester merchants are now generally in direct connexion with native dealers in India. Bombay was the pioneer in the cotton, followed now by Calcutta and Karachi, by which deliveries of goods from Lancashire, mainly under the control of the banks until the native dealers took them up. Manchester business with India, China, &c., is done under various conditions, however, and a good many firms have branches abroad. The regular "indent" by which most of the Manchester Eastern business is conducted now implies a definite offer for shipment from the dealer abroad, either direct or through the exporter's agents, and commonly includes freight and insurance. The term "commission agent" is now discredited, and buying done by Manchester houses on simple commission terms is unusual though not unknown. This has been so since the famous law case of Williamson v. Barbour in 1877, when it was established that whatever might be the custom of the trade a commission agent was not entitled to make a profit over his commission on the various processes, such as handling and packing, which are a necessary part of the exporter's work. A good deal of business is done, however, for South America and other markets in which the goods are bought for delivery in the Manchester warehouse, all charges for packing, &c., and carriage being extra.
COTTON

and some exclusively to foreign trade, but there is a large class with what may be called a margin of alternation, which serves to redress the balance as business in one or other of the sections is good or bad.

Certain kinds of light goods made for India and other Eastern markets are not used in the home trade, and the typical Eastern staples are not generally used in their particular "sizing," but with these exceptions and various specialities almost every kind of cotton cloth is used to some extent in Great Britain. Grey calicoes for home use, except the lowest kinds, are comparatively pure, and of late years the heavy Fillings which used to be common in bleached goods have become discredited. The housewife long persisted in deceiving herself by purchasing filled calicoes, and the movement in favour of purer goods owes a good deal, strangely enough, to the increase in the making-up trade and the consequent inconveniences to workers of sewing machines, whose needles were constantly broken by hard filled calicoes.

This development of the making-up trade has become an important element in the home trade, and it has greatly reduced the retail sale of piece-goods. The purchase of ready-made shirts, underclothing, &c., corresponds to a change in the habits of the people. The factories which have been erected in the north of Ireland, on the outskirts of London and elsewhere turn out millions of garments that would, under the old conditions, have been made at home. It is not necessary here to balance the advantages and disadvantages of the two systems, and it must not be supposed that made-up cotton garments are necessarily cheap and inefficient.

The chief distributing centre of cotton made-up goods is London, though a considerable trade is done through wholesale houses in Manchester and elsewhere. Large warehouses in the city of London carry on the trade and frequently supply Lancashire with her own goods. Of course the partial loss of the piece-goods trade by the shops is not a loss in aggregate trade, as they are the ultimate distributors of the made-up garments, which are probably at least as profitable to retail as calico or flannel sold in lengths.

The normal course of home trade piece-goods is from manufacturer to bleacher, dyer, printer or finisher, either on account of a merchant to whom the goods are sold or on the manufacturer's own account. By far the majority of Lancashire manufacturers sell their goods as they come from the loom, or, as it is called, in the "grey state," but an increasing number now cultivate the trade in finished goods. Usually the manufacturer sells either directly or through an agent to a merchant who sells again to the shopkeeper, but the last twenty or thirty years have seen a considerable development of more direct dealing. Some manufacturers now go to the shopkeeper, and this has made it difficult for the merchant with a limited capital and therefore a limited assortment to survive. The great general houses such as Rylands's, Phillips's and Watt's in Manchester, and Cook's and Pawson's in London, some of which are manufacturers to a minor degree, continue to flourish because under one roof they can supply all that the draper requires, and so enable him to economize in the use of his own capital by spending and at the same time the trouble of attending to many accounts. Some general merchants, indeed, supply what are practically "tied houses," which give all their trade in return for pecuniary assistance or special terms.

The tendency to eliminate the middleman has not only brought a good many manufacturers into direct relation with the shopkeeper, but in some exceptional cases the manufacturer, adopting some system of broadcast advertisement and postal delivery, has dealt with the consumer. Naturally, the merchant resents any developments which exclude him, and some mild forms of boycott have occasionally been instituted. In the United States there has been an arduous struggle over this question, and combinations of merchants have sometimes compelled favourable terms. In England, though the merchant has maintained a great part of the trade with shopkeepers, the developing trade with makers of shirts, underclothing, &c., is mainly done by the manufacturers directly, and perhaps the simplification of relations by direct dealing in the cotton trade has now reached a point of fairly stable compromise. The tendency to direct trading is naturally controlled by the exigencies of capital. Those manufacturers who act as merchants aim to retain the merchant profit and must employ a merchant capital in stocks. There has been a tendency, indeed, to make the manufacturer the stockkeeper, and some merchants do little more than pass on the goods a stage after taking toll. The great improvement in trade during 1905 and 1906 checked this tendency, and probably the manufacturing extensions owed something to the capital set free by the reductions of stocks.

It must be noted, however, that while most of the spinning concerns are worked by limited companies or individuals with a considerable capital, a good many small manufacturers exist who have little capital and are practically financed by their agents or customers. This is so in both the export and home trades.

The home trade merchant or merchant-manufacturer works largely through agents and travellers, and though railway facilities continue to improve, some shopkeepers rarely visit their markets. The difficulty that is naturally experienced by a traveller in finding sufficient support on a sparsely populated "ground" has brought into vogue the traveller on commission who represents several firms. The traveller with salary and allowances for expenses survives, but the quickening induced by an interest in the amount of sales has caused many firms to adopt the principle of commission, which may, however, be an addition to a minimum salary. Of course, such travellers are not peculiar to the cotton trade, but cotton goods in various forms are an important factor in the home trade.

The profits of manufacturers, merchants and shopkeepers are commonly very much less on the lower classes of cotton goods than on the higher ones. Thus while there may be a difference of 1d. per yd. between the qualities on a manufacturer's list, the difference in cost may not be more than a farthing; and, again, while the shopkeeper sometimes pays 2½d. or even 2¾d. per yd. for a calcio to retail at 2½d., his next selling price may be 3¼d. for one which costs him only 2½d. or 3½d. per yd. It appears, therefore, that if the poorer classes of the community have the discretion to avoid the lowest qualities they may obtain very good value in serviceable goods. In the matter of profits, however, there is a good deal of irregularity.

The Manchester Royal Exchange.—There are not many cotton mills or weaving sheds in Manchester, which is, however, the great distributive centre, and its Exchange is the meeting-place of most classes of buyers and sellers in the cotton trade and various trades allied to it. As buyers of finished goods for London and the country do not attend it, certain departments of the home trade are hardly represented, but practically all the spinners and manufacturers and all the export merchants of any importance are subscribers. Transactions between spinners and manufacturers are largely effected on Tuesdays and Fridays, the old "market days," when the manufacturing towns are well represented, but a large amount of business is transacted every day. Besides the persons immediately concerned in the cotton trade and connected with allied trades, a large number of members find it convenient to use the Exchange as a meeting-place as a means of approach to a body of responsible persons. Thus not only bleachers, carriers, chemical manufacturers, mill furnishers and accountants find their way there, but also tanners, timber merchants, stockbrokers and even wine merchants. Since the Ship Canal made Manchester into a cotton port there has been a steady development of the raw cotton trade in Manchester, and many cotton brokers and merchants have Manchester offices or pay regular visits from Liverpool.

The various expansions and developments have made it difficult to maintain the ratio between accommodation and requirements, and although overcrowding is troublesome only during some three or four hours a week, at "high Charge" on market days, various complaints and suggestions provoked in 1906 an appeal from the chairman of directors to the Manchester corporation. This took the form of a suggestion that the Exchange should be worked as a municipal institution on a new site, and though such a development met with opposition it was
COTTON MANUFACTURE

281

apparent that Manchester must presently have a new or an enlarged Exchange. The present building is, however, the largest of its kind in the world, and the history of the various exchanges coincides with the expansion of the Lancashire industry.

According to semi-official records “the first building in the nature of an Exchange” was erected in 1729 by Sir Oswald Mosley, and though designed for “chapmen to meet and transact their business” it appears that, as to-day, encroachments were made by other traders until cotton manufacturers and merchants preferred to do their business in the street. In 1792 the building was demolished, and for a period of some eighteen years there was nothing of the kind. In 1809 the new Exchange was opened, and terms of membership were fixed at two guineas for those within 5 m. of the building and one guinea for those outside this radius. In the following year plans for enlargement were submitted to the shareholders, and various extensions followed, particularly in 1830 and 1847. The present building was opened partly in 1871 and partly in 1874. The area of the great room is 4405 sq. yds. The subscription was raised on the 1st of January 1806 from three guineas to four guineas for new members, but the number of members continues to increase and early in 1906 amounted to 8,868.

Of course in this great mart a large variety of types is to be found and the members fall into some kind of rough grouping. Export buyers, attended by salesmen, are commonly more or less stationary and prominent; Burnley manufacturers abound in one locality and spinners of Scottish yarns in another. The importance of the Exchange as a bargaining centre is fairly maintained, though buyers are assiduously cultivated in their own offices, and the telephone has done a good deal to abbreviate negotiation.

As to the amount of business transacted on the Exchange there is no record. The market reporters make some attempt to materialize the current gossip, and doubtless catch well enough the great movements in the ebb and flow of demand, but the sum of countless obscure transactions cannot be estimated. Some few years ago an attempt was made to mark more clearly the course of business in Manchester, and a scheme was prepared for the recording of daily transactions. This could only have been a somewhat rough affair, but its originator maintained reasonably that it would be of interest if some indication of the daily movements could be obtained. For some time a memorandum of the total of daily sales reported was posted on ‘Change, but the indifference of traders, together with the distrust that makes any innovation difficult, caused the scheme to be abandoned.

It would be difficult in any attempt to estimate the volume of British home trade to distinguish what may be called the effective movements of goods. There is a considerable amount of re-selling both in yarn and cloth, and, though the bulk of cotton goods finds its way through regular and normal channels to the consumer, these channels are not always direct. A good many transactions on the Manchester Exchange are intermediate, without fulfilling any useful function, and could be accomplished by the principals if they were brought together. Again it may be said there are numerous sometimes occupy a precarious position, but they are protected in some degree by law as well as by the customs of the trade and the point of honour. Points of honour in the Manchester business may seem to be arbitrarily selected, but they are an important part of the scheme. An immense amount of business is done without any apparent check against repudiation. It is, of course, the verbal bargain that binds, and large transactions are commonly completed without witnesses, though before the contract or memorandum of sale passes the fluctuations of the market may have made the bargain, to one side or the other, a very bad one.

(A. N. M.)

COTTON MANUFACTURE. The antiquity of the cotton industry has hitherto proved unfathomable, as can readily be understood from the difficulty of proving a universal negative, especially from such scanty material as we possess of remote ages. That in the 5th century B.C. cotton fabrics were unknown or quite uncommon in Europe may be inferred from Herodotus’ mention of the cotton clothing of the Indians. Ultimately the cotton industry was imported into Europe, and by the middle of the 14th century we find it flourishing in Spain. In the New World it would seem to have originated spontaneously, since on the discovery of America the wearing apparel in use included cotton fabrics. After the collapse of Spanish prosperity before the Moors in the 14th century the Netherlands assumed a leadership in this branch of the textile industries as they did also in other branches. It has been surmised that the cotton manufacture was carried from the Netherlands to England by refugees during the Spanish persecution of the second half of the 16th century; but no absolute proof of this statement has been forthcoming, and although workers in cotton may have been among the Flemish weavers who fled to England about that time, and some of whom are said to have settled in and about Manchester, it is quite conceivable that cotton fabrics were made on an insignificant scale in England years before, and there is some evidence to show that the industry was not noticeable till many years later. If England did derive her cotton manufacture from the Netherlands she was unwillingly compelled to repay the loan with interest more than two hundred years later when the machine industry was conveyed to the continent through the ingenuity of Lievein Bauwens, despite the precautions taken to preserve it for the British Isles. About the same time English colonists transported it to the United States. Since, as transformed in England, the cotton industry, particularly spinning, has spread throughout the civilized and semi-civilized world, though its most important seat still remains the land of its greatest development.

As early as the 13th century cotton-wool was used in England for candle-wicks. The importation of the cotton from the Levant in the 16th century is mentioned by Hakluyt, and according to Macpherson it was brought over from Antwerp in 1560. Reference to the manufacture of cottons in England long before the second half of the 16th century are numerous, but the “cottons” spoken of were not cottons proper as Defoe would seem to have mistakenny imagined. Thus, for example, there is a passage by William Camden (writing in 1610) quoted below, in which Manchester cottons are specifically described as woolens, and there is a notice in the act of 3 Henry VIII. (c. xv.) of the Manchester linen and woollen industries, and of cottons—which are clearly woollens since their “dressing and frising” is noted, and the latter process, which consists in raising and curling the nap, is not applicable to cotton textiles. John Leland, after his visit to Manchester about 1538, used these words—“Bolton upon-Moore market standeth most by cottons; divers villages in the Moors about Bolton do make cottons.” Leland, it is true, might conceivably be referring to manufactures from the vegetable fibre, but it is exceedingly unlikely, since the term “cottons” would seem to have been current with a perfectly definite meaning. The goods were probably an English imitation in wool of continental cotton fustians—which would explain the name. Again we may quote from the act of 5 and 6 Edward VI., “all the cottons called Manchester, Lancashire and Cheshire cottons, besides all other such cottons as are not more than forty-two yards and contain in breadth three-quarters or a yard in the yard and shall weigh thirty pounds in the piece at least.” And from the act of 8 Elizabeth c. xi., “every of the said cottons being sufficiently milled or thickened, clean scoured, well-wrought and full-dried, shall weigh 21 lb. at the least.” These are evidently the weights of woolen goods: further, it may be observed that milling is not applicable to cotton goods. The earliest reference to a cotton manufacture in England which may reasonably be regarded as pointing to the fabrication of textiles from cotton proper, is in the will of James Billston (a not un-English name), who is described as a “cotton manufacturer,” proved at Chester in 1578. It may plausibly be contended that James Billston was a worker in the cotton industry.
vegetable fibre, since otherwise "manufacturer of cottons" would have been a more natural designation. But the proof of the will of one cotton manufacturer establishes very little.

The earliest known reference to the cotton industry proper occurs in a petition to the earl of Salisbury, made presumably in the year 1513, asking for the continuance of a grant for reforming frauds committed in the manufacture of "bambazine cotton such as growth in the land of Persia being no kind of wool." But a far more valuable piece of evidence, discovered by W. H. Price, is a petition of "Merchants and citizens of London that use buying and selling of fustians made in England, as of the makers of the same fustians." Its probable date is 1621, and it contains the following important passages:

"About twenty years past, divers people in this kingdom, but chiefly in the county of Lancaster, have found out the trade of making of other fustians, made of a kind of bombast, or down, being a fruit of the earth growing upon little shrubs or bushes, brought into this kingdom by the Turks, merchants from Smyrna and Cyprus, Acra and Sylford, but commonly called cotton wool; and also of linen yarn most part brought out of Scotland, and others made in England, and no part of the same fustians of my wool at all; for which said bombast and yarn imported, he has a great yearly sum of money for the custom and subsidy thereof.

"There is at least 40 thousand pieces of fustian of this kind yearly made in England, the subsidy to his majesty of the materials for making of same fustian a kind of cotton wool, and the piece; and thousands of poor people set on working of these fustians.

"The right honourable duke of Lennox in 11 of Jacobus 1563 procured a patent from his majesty, of alnager of new draperies for 60 years, and in the same patent it was said what wool was converted into other sorts of commodities to the loss of customs and subsidies for wool transported beyond seas; and therein is inserted into his patent, searching and sealing; and subsidy for 80 several stuffs; and among the rest these fustians or other stuffs of this kind of cotton wool, and the piece, and a fee for the same, and forfeiture of 20s. for putting any sale unsealed, the moiety of the same forfeit to the said duke, and power thereby given to the duke or his deputies, to enter any man's house to search for, and seiz such stuffs, and seize them till the forfeiture be paid, and if any resist such search, to forfeit £10 and power thereby given to the lord treasurer or chancellor of the exchequer, to make new ordinances or grant commissions for the aid of the duke and his officers in execution of their office."

Here the date of the appearance of the cotton industry on an appreciable scale—it is questionable whether any importance should be attached to the expression "found out"—is given by those who were present, or who, within the memory of those who tell the story, or their friends, as "about twenty years past" from 1621, and the annual output of the industry in 1621 is mentioned. Moreover, it is established by this document that for a time at least the cotton manufacture was "regulated" like the other textile trades. The date assigned by the petitioners for the first attraction of attention by the English cotton industry may be supported on negative grounds.

Baines assures us that William Camden, who wrote in 1590, devoted not a sentence to the cotton industry, though Manchester figures among his descriptions: "This town," he says, "exceeds the towns immediately around it in handsomeness, populousness, woolen manufacture, market place, church and college; but did much more excel them in the last age, as well by the glory of its woolen cloths (lanceorum pannorum honor), which they call Manchester cottons, as by the privilege of sanctuary, which the authority of parliament under Henry VIII. transferred to Chester." It is significant too that in the Elizabethan poorlaw of 1601 (43 Elizabeth), neither cotton-wool nor yarn is included among the fabrics to be procured by overseers to sell to the poor to trade upon, though it might be argued that so short-stapled a fibre needed for its working, when machinery was rough, a skill in the operative which would be above that of the average person unable to find employment. However, a proposal was made in 1626 to employ the poor in the spinning of cotton and weaving wool.  

Prior to Mr Price's discovery of the petition mentioned above, the earliest known notice of the existence of a cotton industry of any magnitude was the oft-quoted passage from Lewes Roberts's Treasure of Traffic (1617), which runs: "The town of Manchester, in Lancashire, must be also herein remembered, and worthy for their encouragement commended, who buy the yarn of the Irish in great quantity, and weaving it, return the same again into Ireland to sell: Neither doth their industry rest here, for they buy cotton-wool in London that comes first from Cyprus and Smyrna, and at home work the same, and perfect it into fustians, vermillions, dimities and other such stuffs, and then return it to London, where the same is vented and sold, and not seldom sent into foreign parts."  

Despite Lewes Roberts's flattering reference, the trade of Manchester about that time consisted chiefly in woolen frizes, fustians, sackcloths, mingled stuffs, caps, inkle, tapes, points, &c., according to "A Description of the Towns of Manchester and Salford," 1650, and woollens for a long time held the first place. But before another century had run its course cotton proper had pushed into the first rank, though the woolen industry continued to be of unquestionable importance. In 1727 Daniel Defoe could write: "The grand manufacture which has so much raised this town above all others is that of cotton or fustian, and to the woolen "cottons," as he made plain by other references to the industry in the same connexion; but it was not until some fifty years later that the outbreak of the woolen industry from what is now peculiarly the cotton district became unmistakable. As a rule the woolen weavers were driven farther and farther east—Bury lay just outside the cotton area when Defoe wrote—and finally many of them settled in the West Riding. Edwin Butterworth even tells of woolen weavers who migrated from Oldham to the distant town of Bradford in Wiltshire because of the decline of their trade before the victorious cotton industry. Much the same fate was being shared by the linen industry in Lancashire, which was forced out of the county westwards and northwards. The explanation of the three centralizations, namely of the woolen industry, the cotton industry and the linen industry, is not far to seek. The popularity of the fabrics produced by the rising cotton industry enabled it to pay high wages, which, indeed, were essential to bring about its expansion. This a priori diagnosis is supported by contemporary analysis: thus the rapid rise of the spinners (cotton spinning) and the higher wages which it afforded, have so far deprived the makers of worsted goods in that county (Lancashire), that they have found themselves obliged to offer their few remaining spinners larger premiums than the state of their trade would allow." The best operatives of Lancashire were attracted sooner or later to assist the triumphs of art over the vegetable wool. At the same time the scattered woollen and linen workers of Lancashire were suffering from the competition of rivals enjoying elsewhere the economies of some centralization, and the demand for woolen and linen warps in the cotton industry ceased after the introduction of Arkwright's water-twill. When the factory became common the economies of centralization (which arise from the wide range of specialism laid open to a large local industry) increased; moreover they were reinforced by the diminution of social friction and the intensification of business sensitiveness which marked the development of the 19th century. Once begun, the centralizing movement proceeded naturally with accelerating speed. The contrast beneath is an instructive statistical comment:

3 The act referred to is 3 Henry VIII. c. xiv., already mentioned.
5 Aikin's Description of the Country from Thirty to Forty Miles round Manchester, p. 7.
7 For instance Radclife p. 61. Ogden (author of A Description of Manchester, &c., published in 1783), if Aikin's "accurate and well-informed'" (ib. p. 93.) Ogden, says that the period of rapid extension of the cotton industry began about 1770. See also Butterworth's History of Oldham and the passage quoted below in the text.
district in its primitive form, and the performance of agricultural operations. A few short extracts will place before us all the evidence that it is here needful to adduce. First Radcliffe, an eye-witness, writing about 1770, says "the land in our township (Melling) was occupied by between fifty and sixty farmers... and out of these fifty or sixty farmers there were only six or seven who raised their rents directly from the produce of their farms, all the rest got their rent partly in some branch of trade, such as spinning and weaving woollen, linen or cotton. The cottagers were employed entirely in this matter, except for a few weeks in the harvest." Next we may cite Edwin Butterworth who, though not an eye-witness (he was not born till 1812), proved himself by his researches to be a careful and trustworthy investigator. In the parish of Oldham, he recorded, there were "a number of master (cotton-linen fustian) manufacturers, as well as many weavers who worked for manufacturers, and at the same time were holders of land or farmers... The number of fustian farmers who were cottagers working for manufacturers, without holding land, were few. But there were a considerable number of weavers who worked on their own account. cotton was raised at the same time small pieces of land." Other passages might be quoted, but these two will suffice. Weaving was not exactly a by-employment of farm labourers, but many weavers made agriculture a by-employment to some extent, (a) by working small parcels of land, which varied from the size of allotments to farms of a very few acres, and (b) by lending aid in gathering in the harvest when their other work enabled them to do so. The association of manufacturing and weaving survived beyond the first quarter of the 19th century. Of the weavers in many districts and "more especially in Lancashire" we read in the report of the committee on emigration, "it appears that persons of this description for many years past, have been occupiers of small farms of a few acres, which they have held at high rents, and combining the business of the hand-loom weaver with that of a working farmer have assisted to raise the rent of their land from the profits of their loom." One of the first lines of specialization to appear was the severing of the connexion described above, and the concentration of the weavers in hamlets and towns. Finer fabrics and more complicated fabrics were introduced, and the weaver soon learnt that such rough work as farming unfitted his hands for the delicate tasks required of them. Again, really to prosper a weaver found it necessary to perfect himself by close application. The days of the rough fabrics that anybody could make with moderate success were closing in. As a consequence the dispersion of the weavers becomes less and less. They no longer wanted allotments or farms; and their looms having become more complicated, the mechanic proved himself a convenient neighbour. Finding spinners too was an easier task in the hamlet or town than in the remote country parts. But there is no reason to suppose that agriculture and the processes of weaving became less important, since the cotton manufacturer had ever been universally a twin calling. There were two men at a time, probably, when weavers who did nothing but weave were not a significant proportion, if not the major part, of the class of weavers. All again were not independent and all were not employees. Some were simply journeymen in small domestic workshops; others were engaged by fustian masters or Manchester merchants and paid by the piece for what they made out of material supplied them; others again bought their warp and cotton and sold to the merchants their fabrics, which were their own property. The last class was swept away soon after the industry became large, when by the organization of men of capital consumers and producers were more and
distribution of cotton operatives in 1838 and 1868-1890 (from returns of factory inspectors).

The distribution of the industry has varied greatly in the two periods. If it had remained constant Lancashire would only have contained 300,000 operatives in 1899, instead of the actual 400,000. Scotland, on the other hand, only contained 30,000 instead of 70,000, and in Ireland the numbers were one-tenth of what they should have been. The percentage of operatives in Lancashire in 1838 was 58.5%, but this increased to 75.7% in 1868.

Why, we may naturally inquire, did not the cotton industry localize in the West Riding or Cheshire and the woolen industry maintain its position in Lancashire? Accident no doubt partly explains why the cotton industry is carried on where it is in the various parts of the globe, but apart from accident, as regards Lancashire, it is sufficient answer to point to the peculiarly suitable conditions of weather and landscape to be found there. There is firstly the climate, which for the purpose of cotton spinning is unsurpassed elsewhere, and which became the first order of importance when fine spinning was developed. In the Lancashire atmosphere in certain districts just about the right humidity is contained on a great number of days for spinning to be done with the least degree of difficulty. Some dampness is essential to make the fibres cling, but excessive moisture is a disadvantage. Over the country of Lancashire the prevailing west wind carries comparatively continuous currents of humidified air. These currents vary in temperature according to their elevation. Hot and cold layers mix when they reach the hills, and the mixture of the two is nearer to the saturation point than either of its components. The degree of moisture is measured by the ratio of the actual amount of moisture to the moisture of the saturation point for that particular temperature. Owing to the sudden elevation the air is rarefied, its temperature being thereby lowered, and in consequence condensation tends to be produced. In several places in England and abroad there is a scarcity of moisture, artificial humidifiers have been tried, but no cheap and satisfactory one has hitherto been discovered. To the advantages of the Lancashire climate for cotton spinning must be added—especially as regards the early days of the cotton industry—its disadvantages for other callings. The unpleasantness of the weather renders an indoor occupation desirable, and the scanty sunshine, combined with the unfriendly nature of much of the soil, prevents the absorption of the population in agricultural pursuits. In later years the port of Liverpool and the presence of coal supplemented the attractions which held the cotton industry in Lancashire. All the raw material must come from abroad, and an enormous proportion of English cotton products figures as exports. The proximity of Liverpool has aided materially in making the cotton industry a great exporting industry.

Before the localization of the separate parts of the industry can be treated the differentiation of the industry must be described. We pass then, at this stage, to consider the manufacture in its earliest form and the lines of its development. First, and somewhat incidentally, we notice the early connexion between the conduct of the cotton manufacture, when it was a domestic
COTTON MANUFACTURE

more kept in touch. In early days most weavers owned their looms, the great part of which they had frequently constructed themselves: later, however, a large number hired looms, and it was as usual in certain quarters for lodgings to be let with a loom as it is to-day for them to be provided with a piano. When it became customary for weavers to undertake a variety of work, the masters usually provided reeds (which had to vary in fineness with the fineness of the warp), healds, and other changeable parts, and sometimes they employed the gaiters to fit the new work in the looms.

Until the success of the water-frame, cotton could not be spun economically of sufficient strength and fineness for warps, and the warps were therefore invariably made of either linen or wool. Some were manufactured locally, others were imported from Germany, Ireland and Scotland. The weaver prepared them for his loom by the system of peg-warping, but after the introduction of the warping-mill he received them as a rule all ready for insertion into the loom from the Manchester merchant or local fustian master.

"It did not pay the individual weaver to keep a warping-mill for occasional use only, and frequently the contracted space of his workroom precluded even the possibility of his doing so. The invention of the warping-mill was therefore essential, and it became necessary that warping should be done to order, since at that time, the state of the industrial world being what it was, no person could ordinarily have been found to adventure capital in producing warps ready; for, in the absence of the element of demand for the great variety of fabrics which was then even produced. Moreover, had the weaver himself placed the orders for his warps, any occasional delay in the execution of his commissions might have stopped his work entirely until the warps were ready; for warps were necessary before the system of the merchant delegating the preparation of warps there was less objection to than that of the system of the weaver doing so, since the merchant, dealing in large quantities, was more likely to get pressing orders speeded to time. Further, the merchant knew first what kind of warps would be needed. The first solution, however, that of the merchant undertaking the warping himself, was the surer, and there was no doubt as to its being the one destined for selection in a period when a tendency to centralize organization, responsibility and all that could be easily centralized, was steadily gaining in strength." 2

Guest says the system by which the weaver was supplied with warps and other material was substituted for the purchase of warps and cotton-wool by the weaver about 1760. No doubt the change was very gradual, especially as Aikin mentions the use of warping-mills in the 17th century. The weaver as a rule received his weft material in the form of cotton-wool and was required to arrange himself for its cleaning and spinning. According to Aikin, 3 dealers tried the experiment of giving out weft instead of cotton-wool, but "the custom grew into diocese as there was no detecting the knavery of the spinners till a piece came in woven." As it was impossible to unwork the yarn and test it throughout its length, defects were hidden until it came to be used, and the complaints of weavers were not conclusive as to the inferiority of the yarn, since their own bad workmanship might have had something to do with its having proved unsatisfactory. It was therefore found best to saddle the weaver with full responsibility for both the spinning and weaving. Women and children cleaned, carded and spun the cotton-wool in their homes. The cotton had to be more thoroughly cleaned after its arrival in this country. The ordinary process of cleaning was by "willowing," the cotton being beaten with a willow switches after it had been laid on a tight bundle of cords. The cotton used for fine spinning was also carefully washed, and even when it was not washed it was soaked with water and partially dried so that the fibres might be made to cling together. 4 Most of the weaving was done by men, and until the invention of the fly-shuttle they cast the shuttle from hand to hand in the manner of their remotest ancestors. For making the broader fabrics two weavers were required when the width was greater than the easy stretch of a man's arms. Sometimes cloths were woven wide and then split into two or more: hence the term "spits." This became a common practice when the hand-loom workers were groaning under the pressure of competition from the power-loom.

We now reach the era of the great inventions. In order to ensure clearness it will be desirable to consider separately the branches of spinning and weaving: to pass from the one to the other, and follow the chronological order, might cause confusion. First emphasis must be laid upon the point that it was not mechanical change alone which constituted the industrial revolution. No doubt small hand-loom factories would have become the rule, and more and more control over production would have devolved upon the factory master, and the work to be done would have been increasingly assigned by merchants, had the steam-engine remained but the dream of Watt, and semi-automatic machinery not been invented. The spirit of the times was centralizing management before any mechanical changes of a revolutionizing character. All inventions, in which several journeymen were employed, were not uncommon: thus "in the latter part of the last (18th) and the beginning of the present (19th) century," says Butterworth, describing the state of affairs in Oldham and the neighbourhood, "a large number of weavers...possessed spacious loom-shops, where they not only employed many journeymen weavers, but a considerable proportion of apprentice children." It is true that both the fly-shuttle and drop-box had been invented by that time, but the loom was still worked by human power. Specialism, however, was on the increase, the capitalist was assuming more control, and the operative was being transformed more and more into the mere executive agent. Further, as creative of enterprise, an atmosphere of freedom and a general economic restlessness, consequent upon the reaction against mercantilism, were noticeable. Great changes, no doubt, would soon have swept over Lancashire had a new source of power and big factories not been rendered essential by inventions in spinning.

The chief inventors were Lewis Paul and John Wyatt, James Hargreaves and Samuel Crompton. The two first originated the principle of spinning by rollers. Their patent was taken out in 1738, but no good came of it immediately, though many trials were made and moderately large sums of money were lost. Ultimately Richard Arkwright brought forward the same plan improved: 5 his first patent was dated 1769. Over the real authorship of the fundamental idea there has been much controversy, and it has not been absolutely proved that the second inventor, whether Thomas Highs, Arkwright or John Kay (a clockmaker of Warrington who assisted Arkwright to construct his machine and is said by some to have told him of an invention by Highs), did not hit upon the device afresh in ignorance of the work already done. Even as between Paul and Wyatt it is not easy to award due measure of praise. Probably the invention, as a working machine, resulted from real collaboration, each having an appreciable share in it. Robert Cole, in his paper to the British Association in 1858 (reprinted as an appendix to the 1st ed. of French's Life of Crompton), championed the claims of Paul, but Mantoux, in his La Révolution industrielle au XVIIIe siècle, after studying the Wyatt MSS., inclines to attribute to Wyatt a far more important position, though he dissenters from the view of Baines, who ascribes little or nothing to Paul.

Arkwright's prospects of financial success were much greater than those of his predecessors, because, first, there was more employ her son George shortly after he could walk, as a "dolly-peg" to tread the cotton in the soapy water in which it was placed for washing. See French's Life of Crompton, pp. 58-59 (3rd ed.). Rowbotham in his diary gives two accounts of fires which were caused by carelessness in drying cotton.

4 On the difference between the two machines see Baines' History, p. 136 et seq.

COTTON MANUFACTURE

need in his time of mechanical aids, and secondly, he was highly talented as a business man. In 1775 he followed up his patent of 1769 with another relating to machinery for carding, drawing, and roving. The latter patent was widely infringed, and Arkwright was compelled to institute nine actions in 1781 to defend his rights. An association of Lancashire spinners was formed to defend him, and by the one that came to trial the patent was set aside on the ground of obscurity in the specifications. Arkwright again attempted to recover his patent rights in 1785, after the first patent had been in abeyance for two years. Before making this further trial of the courts he had thought of proceeding by petition to parliament, and had actually drawn up his “case,” which he was ultimately dissuaded from presenting. In it he prayed not only that the decision of 1781 should be set aside, but that both patents should be continued to him for the unexpired period of the second patent, i.e. until 1789. In his “case” (i.e. the petition mentioned above) Arkwright stated that he had sold to numbers of adventurers residing in the different counties of Derby, Leicester, Nottingham, Worcester, Stafford, York, Hertford and Lancaster, many of his patent machines, and continued: “Upon a moderate computation, the money expended in the consequence of such grants (before 1782) amounted to at least £60,000, Mr Arkwright’s expenses and his partners amounted to £10,000, and Mr Arkwright also erected a very large and extensive building in Manchester at the expense of upwards of £4000. Thus a business had been formed which already (he calculated) employed upwards of five thousand persons, and a capital on the whole of not less than £200,000.”

It is impossible to discover exactly the rights of the parties. Certainly Arkwright had been intentionally obscure in his speculations, as he admitted, and for his defence, namely that it was to preserve the secret for his countrymen, there was only his word. He may have hoped to keep the secret for himself; and as to the originality of both inventions there were grave doubts. But Arkwright has received little sympathy, because his claims were regarded as grasping in view of the large fortune which he had already won. He began work with his first partners at Nottingham (where power was derived from horses) and started at Cromford in 1771 (where the force of water was used). Soon he was involved in numerous undertakings, and he remained active till his death in 1792. He had met throughout with a good deal of opposition, which possibly to a marked extent was stimulating. Even in the matter of getting protective legislation framed to give scope to the application of the water-frame, a powerful section of Lancashire employers worked against him. This protective legislation must here be shortly reviewed.

In 1700 an act had been passed (11 & 12 William III. c. 10) prohibiting the importation of the printed calicoes of India, Persia and China. In 1721 the act 7 George I. c. 7 prohibited the use of any “printed, painted, stained or dyed calico,” excepting only calicoes dyed all blue and muslins, neckcloths and fustians. This act was modified by the act 9 George II. c. 4 (allowing British calicoes with linen warps). Thus the matter stood as regards prints when Arkwright had demonstrated that stout cotton warps could be spun in England, and at the same time the officers of excise insisted upon exacting a tax of 6d. from the plain all-cottons instead of the 3d. paid by the cotton-linens, on the ground that the former were calicoes. Arkwright’s plea, however, was admitted, and by the act 14 George II. c. 72 the still operative part of the act of 1721 was set aside, and the manufacture, use, and wear of cottons printed and stained, &c., was permitted subject to the payment of a duty of 3d. per sq. yd. (the amount paid on cotton-linens) provided they were stamped “British manufactory.” The duty was varied from time to time until its repeal in 1832.

Some more powerful force than that of man or horse was soon needed to work the heavy water-frames. Hence Arkwright placed his second mill on a water-course, fitting it with a water-wheel, and until the steam-engine became economical most of the new twist mills were built on water-courses. On rare occasions the old fire-engines seem to have been tried.

The following passage quoted from a note in Baines’s History illustrates the pressing need of the case: “On the river Irwell, from the first mill near Birk-cup, to Prestolee, near Bolton, there is about 900 ft. of fall available from mills, 800 of which is occupied. On this river and its branches it is computed that there are no less than 2000 mills. A project is in course of execution to increase the waterfalls of the district, already so great and so much concentrated, and to equalize the force of the stream by forming eighteen reservoirs on the hills, to be filled in times of flood, and to yield their supplies in the drought of summer. These reservoirs, when completed, would cover 270 acres of ground, and contain 241,300,000 c.u. ft. of water, which would give a power equal to 6600 horses. The cost is estimated at £59,000. One reservoir has been completed, another is in course of formation, and it is probable that the whole design will be carried into effect.”

As early as 1788 there were 143 water-mills in the cotton industry of the United Kingdom, which were distributed as follows among the counties which had more than one.

The need of water to drive Arkwright’s machinery, and its value for working other machinery, caused a strong decentralizing tendency to show itself in the cotton industry at this time, but more particularly in the twist-spinning branch. Ultimately the steam-engine (first used in the cotton industry in 1785) drew all branches of the industry into the towns, where the advantages of their juxtaposition—i.e. the external economies of centralization—could be enjoyed. Out of the crowding of the mills in one locality sprang the business specialization which has continued up to the present day. Here it will not be out of place to notice the appearance of the new forms of electricity, in the cotton industry, the extension of which may involve striking economic changes. The first electric-driven spinning-mill in Lancashire, that of the “Acme” Spinning Company at Pendlebury, the work of which is confined to the ring-frame, was opened in 1905. Power is obtained from the stations of the Lancashire Power Company at Outwood near Radcliffe, some 5 m. distant.

The chief principle of the water-frame was the drawing out of the yarn to the required degree of tenacity by sets of gripping rollers revolving at different speeds. This principle is still applied universally. Twist was given by a “flyer” revolving round the bobbin upon which the yarn was being wound; the spinning-so effected was known as thrum-spinning. The plan is still common in the subsidiary processes of the cotton industry, but for spinning itself the ring-frame, which appears to have been invented simultaneously in England and the United States (the first American patent is dated 1828), is rapidly supplanting the thrum-frame, though the “ooziness” of mule yarn has not yet been successfully imitated by ring-frame yarn. The great invention relating to weft-spinning was the jenny, introduced by James Hargreaves probably about 1764, and first tried in a factory four years later. Hargreaves was unfortunate in not being able to maintain his patent, because he had sold jennies before applying for protection. Crompton’s mule, which combined the principles of the rollers and the jenny, was perfected about 1779. Both jennies and mules were known as “wheels,” because they were worked in part by the turning of a wheel. As they could be set in motion without using much power, being light when of moderate

1 Baines p. 183.

2 Baines’s History of the Cotton Manufacture, p. 86 n.

3 These figures are quoted from a pamphlet published in 1788 entitled “An Important Crisis in the Calico and Muslin Manufacture in Great Britain explained.” Many of the estimates given in this pamphlet are worthless, but there seems no reason why the figures quoted here should not be at least approximately correct.

4 See article on Cotton-Spinning Machinery.

5 Hargreaves’ claim to this invention has been disputed, but no satisfactory evidence has been brought forward to disprove his claim. Hargreaves was a carpenter and weaver of Stand-hill near Blackburn, and died in 1778.
size, for a long time they were worked entirely by hand or partially with the aid of horses or water. The first jenny- and mule-loom factories were small for this reason, and also because skill in the operative was a matter of fundamental importance,¹ as it was not in twist-spinning on the water-frame. The size of the typical weft-spinning mill suddenly increased after the scope for the application of power was enlarged by the use of the self-actor mule, invented in 1825 by Richard Roberts, of the firm of Sharp, Roberts & Co., machinists, of Manchester. In 1830 Roberts improved his invention and brought out the complete self-actor. Self-actors had been put forward by others besides Roberts—for instance by William Strutt, F.R.S.,(son of Arkwright’s partner), before 1790; William Kelly, formerly of Lanark mills, in 1792; William Eaton of Wilm in Derbyshire; Peter Ewart of Manchester; de Jough of Warrington; Buchanan, of Catrine works, Scotland; Knowles of Manchester; and Dr Brewer of America—¹—but none had succeeded. And Roberts’s machines did not immediately win popularity. For a long time the winding done by them was defective, and they suffered from other imperfections. Broadly speaking, until the American Civil War the number of hand-mules in use remained high. It was for the fine “counts” in particular that many employers preferred them.² About the end of the sixties, however, and in the early seventies, great improvements were effected in machinery, partly under the stimulus of a desire to elevate its fitness for dealing with short-staple cotton, and it became evident that hand-mules were doomed. Here we may suitably refer to the scutching machine for opening and cleaning cotton, invented by Mr Snodgrass of Glasgow in 1797, and introduced by Kennedy⁴ to Manchester in 1808 or 1809; the cylinder carder invented by Lewis Paul and improved by Arkwright; and the lap-machine first constructed by Arkwright’s son.

We now transfer our attention to that accumulation of improvements in manufacturing (as weaving is technically termed) which, taken in their entirety, represented the large factory system which covered Lancashire to-day. Gradually, for many years, the loom had been gathering complexities, though no fundamental alteration was introduced into its structure until 1738, when John Kay of Bury excited the wrath of his fellow-weavers by designing and employing the device of the fly-shuttle. For some unfathomable reason—for the opposition of the weavers hardly explains it, though they expressed their views forcibly and acted upon them violently—this invention was not much applied in the cotton industry until about a quarter of a century after its appearance. The plan was merely to substitute for human hands hammers at the ends of a lengthened lathe along which the shuttle ran, the hammers being set in motion by the jerking of a stick (the picking peg) to which they were attached by strings. The output of a weaver was enormously increased in consequence. In 1760 John Kay’s son Robert added the drop-box, by the use of which many different widths of web could be worked into the same fabric without difficulty. It was in fact a partitioned lift, any partition of which could be brought to a level with the lathe and made for the time continuous with it. The drop-box usefully supplemented the “draw-boy,” or “draught-boy,” which provided for the raising of warps in groups, and thereby enabled figured goods to be produced. The “draw-boy” had been well known in the industry for a long time; in 1687 a Joseph Mason patented an invention for avoiding the expense of a servant to work it,⁵ but there is no evidence to show that his invention was of practical value. Looms with “draw-boys” affixed, which could sometimes be worked by the weavers themselves, later became common under the name of harness-looms, which have since been supplanted by Jacquard looms, wherein the pattern is picked out mechanically.

The principle of the fly-shuttle was a first step towards the complete mechanizing of the action required for working a loom. The second step was the power-loom, the initial effort to design which was created by the tardiness of weaving as contrasted with the rapidity of spinning by power. After the general adoption of the jenny, supplies of yarn outran the productive powers of the agencies that existed for converting them into fabrics, and as a consequence, it would seem, some yarn was directed into exports which might have been utilized for the manufacture of cloth for export had the loom been more productive. The agitation for the export tax on yarn at the end of the 18th, and in the first years of the 19th century, is therefore intelligible, the yarn producers being anxious to increase the market for the allegations by which it was supported. For a large proportion of the exported yarn, fabrics could not have been substituted, since the former was required to feed the hand-looms in continental homes and domestic workshops, against much of the product of which there was no chance of competing. The hand-loom was securely linked to the home of the peasant, and though he would buy yarn to feed his loom he would not buy cloth and break it up.

Cartwright’s loom was not the first design adapted for weaving by power. A highly rudimentary and perfectly futile self-actor weaving machine, which would have been adapted for power-working had it been capable of working at all, had been invented by a M. de Gennes: a description of it, extracted from the Journal de seances, appeared in the Philosophical Transactions for July and August 1678, and again in the Gentleman’s Magazine in 1751 (vol. xxii. p. 397-398). It consisted of a single machine 8 ft. high, 2 ft. wide, and worked by a hand-loom for the employment of “engine or Dutch looms such large and opulent fortunes as hath enabled them to live with some of the best gentlemen of the country,” and it is alleged that these machines, which were twelve or fourteen pieces at once, were “in use in Manchester thirty years ago.”⁶ One power-factory at least was devoted to them as early as 1760, namely that of a Mr Gartside at Manchester, where water-power was applied, but the enterprise failed.⁷ Cartwright’s invention was probably perfected in its

¹ See Chapman’s Lancashire Cotton Industry, pp. 59 et seq.
² See Baines’ p. 207.
³ “Counts” are determined by the number of hanks to the lb. in 15 yds. The origin of the hank of 840 yds. is probably that spinners used a winding-reel of 15 yds. in circumference, so that 80 threads (one “he” or “rap” according to old phraseology) would contain 120 yds., and seven less (i.e. a hank) would contain 920 yds. A hank of seven less was the common measure in the woollen industry, in which the reels were 1 yd. or 2 yds. in circumference. For details see an article on the subject in the Textile World Record, vol. xxxi. No. 1.
⁴ The author of the memoir of Crompton (see bibliography).
⁵ Specification 257.
⁶ For further analysis of the arguments current see Chapman’s Lancashire Cotton Industry, pp. 66 et seq.
⁷ Also in the 17th century a John Barkstead was granted a patent for a method of manufacturing cotton goods, but the method is not described. 1691, Specification 276.
⁸ In the parliamentary reports (1840), pp. 611, the invention of the “Swivel-loom” is claimed for a “Van Anson.” It is a plausible supposition that “Van Anson” is meant Vaucanson, as he appears to have improved the Swivel-loom. But he could not have had the original invention, since in 1724 (that is, when Vaucanson was at the most fifteen years of age) they were being employed in Manchester.
⁹ Aikin, pp. 175-176, and Guest, p. 44. An explanation of the mechanism of the swivel-loom will be found in the Encyclopædia méthodes, arts et métiers, p. i. vol. ii. pp. 205, 206, and Recueil de planches, vol. vi. (1786), pp. 72-78.
COTTON MANUFACTURE

first form about 1787, but many corrections, improvements and additions had to be effected before it became an unqualified success. Cartwright's original idea was elaborated by numerous followers, and supplementary ideas were needed to make the system complete. Of the latter the most important were those due to William Radcliffe, and an ingenious mechanic who worked with him, Thomas Johnson, who were patented in 1805 and 1804. They related to the dressing of the warp before it was placed in the loom, and for the mechanical taking up of the cloth and drawing forward of the warp, so that the loom had not to be stopped for the cloth to be moved on and the warp brought within play of the shuttle to be sized. Looms fitted with the latter of these devices were known as "dandy" looms. The looms that followed could not be described here, nor need we concern ourselves with the degree in which some were improvements of others. It is of interest to note, however, in view of recent developments, that one of Cartwright's patents included a warp-stop motion, though it was never tried practically so far as the writer is aware. Looms with warp-stop motions are now common in the United States, as are also automatic looms, but both are still the exception in Lancashire for reasons that will be sketched later.

Power-loomws won their way only very gradually. Cartwright and others lost fortunes in trying to make them pay, but the former was compensated by a grant of £10,000 from government. In 1815 there were 2400 only in the whole of the United Kingdom, but in 1820 there were 14,000, beside some 240,000 hand-loomws; in 1825, 55,500; in 1833, 100,000; and in 1870, 440,700.1 To-day there are about 700,000 in the cotton industry. The beginning, and the final consequences, of the competitive pressure of the power-loomws may be read in the reports of official inquiries and in Rowbotham's diary.2 It was upon the fine work that the hand-loom weavers retained their last hold. In 1829 John Kennedy wrote in his paper to the Manchester Literary and Philosophical Society on "The Rise and Progress of the Cotton Trade," "It is found ... that one person cannot attend upon more than two power-loomws, and it is still problematical [even in 1829, observe] whether the saving of labour counterbalances the expense of power and machinery and the disadvantage of being obliged to keep an establishment of power-loomws constantly at work." It was not easy to obtain a sufficiency of good hands for the power-loomws, because the operatives, who had acquired their habits under the domestic system, hated factory life. This, in conjunction with the ease with which the art of coarse weaving could be acquired and the cheapness of rough looms, helps to explain the wretched straits into which the hand-loom weavers were driven.

Improvements in machinery, which ultimately affected every process from cleaning the cotton to finishing the fabric, and the application of water and steam-power, so lowered the cost of production as to render Lancashire the cotton factory of the world. Figures are quoted in the table to show the rate of growth in different periods of England's imports and exports as regards the raw material and products of this industry. It is important to remember when reading the last 6 columns that the value of money was the same in 1831-1835, 1831-1855 and 1876-1880; the sums of Sauerbeck's index numbers for these periods were 445, 451 and 444 respectively. In the last two periods there were considerable depressions in prices. If prices had remained constant, in the periods 1819-1825 and 1896-1900 the figures of exports would have been £60 millions and £121 millions respectively. The growth in trade has been partly occasioned by the enormous increase in the volume of cotton goods consumed all over the world, which in turn has been due to (1) the growth of population, (2) the increase in productive efficiency and well-being, and (3) the substitution of cotton fabrics for woolen and linen fabrics. The rate of growth between the periods 1771-1781 and 1781-1791 (which is not shown in the above table) was particularly remarkable, and reached as high a figure (when measured by importations of weight of cotton) as 320%. Nothing is more interesting in the cotton industry than the processes of differentiation and integration that have taken place from time to time. Weaving and spinning had been a large-extent united in the industry in its earliest form, in that both were frequently conducted beneath the same roof. With mechanical improvements in spinning, that branch of the industry became a separate business, and a substantial section of it was brought under the factory régime. Weaving continued to be performed in cottages or in hand-loom sheds where no spinning at all was attempted. Cartwright's invention carried weaving back to spinning, because both operations then needed power, and the trouble of marketing yarn was largely spared by the reunion. Mr W. R. Grey stated in 1833 to the committee of the House of Commons on manufactures, commerce and shipping, that he knew of no single person then building a spinning mill who was not attaching to it a power-loom factory. Some years later the weaving-shed split away from spinning, partly no doubt because of the economies of industrial specialization, partly because of commercial developments, to be described later, which rendered disassociation less hazardous than it had been, and partly because, in consequence of these developments, much manufacturing (as weaving is termed) was constituted a business strikingly dissimilar from spinning. The manufacturer runs more risks in laying by stocks than the spinner, because of the greater variety of his product and the more frequent changes that it undergoes. The former, therefore, must devote more time than the latter to keeping his order book and the productive power of his shed in close correspondence. The minute care of this kind that must be exercised in some classes of businesses explains why the small manufacturer still holds his own while the small spinner has been crushed out. It also explains to some extent the prevalence of joint-stock companies in spinning, and their comparative rarity in manufacturing. Here we should notice, perhaps, that the only combination of importance in the cotton industry proper (apart from calico-printing, bleaching, &c., and the manufacture of sewing-cotton) is the Fine Cotton Spinners and Doublers Association, founded in 1898, which is practically coextensive with fine spinning and doubling.

1 Figures for the years above up to 1838 will be found in parliametary reports (1839, xxiv. p. 611).
2 This is the manuscript diary of a weaver of Oldham roughly covering the period 1787 to 1830. It is now in the Oldham public library. Mr S. Andrew edited extracts from it in a series of articles in the Standard (an Oldham paper), under the title Annals of Oldham, beginning January 1, 1887.

Differ- ence and Integration.
The specialization of the two main branches of the industry has been followed by the specialization of sub-branches and by the localization of specialized parts. Of the localization of certain sections of the cotton industry the late Mr Elijah Helm, who spoke with the authority of great local knowledge, has written as follows:

"Spinning is largely concentrated in south Lancashire and in the adjoining borderland of north Cheshire. But even within this area there is further allocation. The finer and the very finest yarns are spun in the neighbourhood of Bolton, and in or near Manchester, much of this being used for the manufacture of sewing-thread; whilst other descriptions, employed almost entirely for weaving, are produced in Oldham and other towns. The weaving branches of the industry are chiefly conducted in the north-western section of Lancashire; most of it in very large boroughs, as Blackburn, Burnley, and Preston. Here, again, there is a differentiation. Preston and Chorley produce the finer and lighter fabrics; Blackburn, Darwen and Accrington, shirtings, dhoties and other goods extensively shipped to India; whilst Nelson and Colne make cloth woven from dyed yarn, and Bolton is distinguished for fine quilting and fancy cotton dress goods. These demarcations are not absolutely observed, but they are sufficiently clear to give to each town in the area covered by the cotton industry a distinctive place in its general organization."

The present local distribution of the cotton industry, as far as it is displayed statistically, is revealed in the table beneath, based upon the figures of spindles and looms given by Worrall and those of operatives in the census returns of 1901.

**Distribution of Cotton Operatives in Lancashire and the Vicinity according to the Census Returns of 1901, together with the Number of Spindles and Looms according to Worrall.**

</table>

Local markets have steadily lost in importance, partly owing to railway development, and it is now almost entirely in Manchester, on the Exchange, that dealing in yarnc and fabrics takes place, and arrangements are made for export. The old Manchester Exchange, built in 1729, was taken down in 1792. A new Exchange, reared on a contiguous site, was opened in 1809, the first stone having been laid in 1806. The present building was erected in 1869. The great bulk of the exports of cotton goods proceeds from Liverpool, though London used to be the leading port, and Liverpool is still the chief English market for raw cotton, though now from one-sixth to one-eighth of English cotton supplies come up the Manchester Ship Canal.

1 Printed in British Industries. Edited by W. J. Ashley.
2 Manchester only.
3 The number of operatives in places in Derbyshire is not separately specified.
4 Includes Foulridge with Colne.

To understand the present organization of the cotton industry the reader must begin by mentally separating the commercial from the industrial functions. By the industrial functions are meant the arrangements of factors in production—choosing the most suitable machinery and hands, combining them in the most economical system, adapting the material used to this system, and keeping its working at the highest attainable level. The commercial functions consist in business which is not industrial. Analysis will show that there are, broadly speaking, two classes of commercial functions, namely (1) arranging for purchases and sales, and (2) the bearing of risks. The character of the former is apparent: it consists, as regards yarn, in discovering for each manufacturer which spinner makes the yarn which is best adapted to his requirements at the lowest cost, and in finding the most suitable customers for spinners. Risk-bearing is a commercial function of another kind. Every business that involves anticipation involves commercial risks. Thus the spinner who sells "forward" yarn, trusting that the price of cotton will not rise, is taking commercial risks, and so is the spinner who produces for stock, trusting that the class of yarn that he is making will continue in demand. These two instances will suffice to indicate what is meant by the carrying of commercial risks. To make the rest of our argument clear it will be well to write down formulae. Let A and B represent respectively the industrial operations of spinning and manufacturing. Let a and b represent respectively the commercial operations implied by the separate existence of A, that is, the buying of cotton and the selling of yarn, and let A and B stand for the commercial operations associated with manufacturing, that is, the buying of yarn on the one hand, and the finding of customers and arranging for their purchases on the other hand. Then, A and B being distinct businesses, it is obvious that a range of schemes is possible of which the extremes may be roughly represented as follows:

1. (a)(A), (b)B
2. (a), (A), (ab), (B), (β),

where the brackets signify independent businesses. In case 1 each spinning business would be engaged with three problems, namely, (i) buying material at the most favourable time, (ii) producing at the lowest cost, and (iii) finding buyers and selling at the highest price, including the arrangement for the performance of the most remunerative work. But in case 2 the spinner would confine his attention to purely industrial matters, while the problem of finding cotton and arranging for the bearing of the risks as to future prices would rest with other persons, and the business of bringing spinner and manufacturer together and taking such risks as may be involved in ordering or disposing of yarn would be the function of some others. In case 2 the commercial functions may be said to have differentiated completely from the main body of the industry. We need hardly give illustrations of the intermediate arrangements that formally lie between cases 1 and 2. A may retain commercial risks but find customers through intermediaries; in such an event there would be only partial differentiation of the commercial functions. The reader must be reminded also that for the sake of simplicity in the formulae we have overlooked different classes of A and of B, omitted bleaching, dyeing, printing and finishing, and drawn no distinction between the various classes of commercial work covered by one letter, for instance, selling in the home market and selling abroad.

It may help the reader to appreciate the organic growth of the cotton industry if we now run over the main lines of its evolution. Originally the industrial units were held together in one homogeneous commercial body. The Manchester merchants bought cotton and warps, put them out to the weavers, and arranged for the finishing of the cloth and then for its sale, so far as they had not been acting on orders already received. There were variations of this system—for instance, in early years weavers sometimes bought their own yarns and cotton and sold their cloth—but just before the industrial revolution the arrangement sketched above was the most usual. Adverting to our formula, the Manchester merchants, we observe, performed functions...
COTTON MANUFACTURE

a (in conjunction with importers), b (as regarded warps), and β. Weft the weaver had to get spun by his family or outsiders. So, broadly speaking, there was one single commercial setting. After the appearance of the factory, the commercial work as between the water-tower mills, the mule-spinning businesses and the manufacturers, so far as the businesses were distinct, appears to have been done by the several producing firms concerned. It was not at once that (ab) began to differentiate. β was already a separate business in the hands of Manchester merchants and the foreign houses who had established themselves in Manchester to direct the export trade. At the present time an advanced stage of commercial specialization has been reached. From the risks connected with the buying of cotton the spinner may if he please escape entirely.1 Selling work is now done usually through intermediaries, but there is no one uniform rule as to the carrying of the commercial risks involved. This appears to be now to some extent a matter of arrangement between the persons concerned, but ultimately no doubt the risks will have to be borne by those most qualified by experience to bear them, namely, the commercial specialists. In no other trade in England, and in no other cotton industry abroad, has commercial specialization been carried so far as in the cotton trade of Lancashire. It is partly in consequence of the differences in this respect between the cotton industry in Lancashire and abroad that the separation of spinning from weaving is far more common in England than elsewhere. Elsewhere producers are deterred from specializing processes further in distinct businesses by the fear of the worries of buying and selling as between them.

The explanation of differences in respect of the degree of commercial specialization in different places and industries can be formulated only very generally. Time is required for the differentiation and localization to take place. The English cotton trade had not advanced very far in the "thirties," if we are to judge from the evidence given to commissions and parliamentary committees. The general conditions under which commercial specialization evolves may be taken to be a moderately limited range of products which do not present many varieties, and the qualities of which can be judged generally on inspection. In such circumstances private markets need not be built up, as they must be, for instance, for a new brand of soap which claims some subtle superiority to all others. Soaps under present conditions must be marketed by their producers. Broadly stated, if there be little competition as to substitutes, though there may be much as to price in relation to quality, commercial functions may specialize. On the whole this is the case in the cotton industry; in so far as it is not and firms produce specialities, they undertake much of the marketing work themselves.

The advantages of commercial specialization are numerous. Firstly it allows of differentiation of industrial processes, and this, of necessity, is accompanied by increasing returns. When weaving dissociates from spinning, both the number of looms in each business and the number of spindles in each business tend to increase; more division of labour is therefore secured, and lower costs of production are reached, and there is a further gain because producers concentrate their attention upon a smaller range of work. Again when producers are freed entirely, or to some extent, from commercial worries, they can attain a higher level of efficiency at the industrial task of mill organization, and a more perfect accommodation of capacity to function will be brought about. If the business unit is (aAa), a particular person may retain his place in the market by reason of his excellence at the work a or a, though as works organizer (i.e. at the performances of function A) he may be incompetent. The heads of businesses will succeed according to their average capacities at the three tasks a, A and a, and there is no guarantee, therefore, that any one of these tasks will be performed with the highest attainable efficiency in our present somewhat immobile economic system. But if the three functions are separated there is more certainty of a person's success in the performance of each determining his continued discharge of it. The problems that arise when specialized markets become very highly developed are dealt with in the article Cotton: Marketing and Supply.

The distribution of cotton operatives among the chief centres has already been shown, but their distribution between processes has yet to be considered, and the proportions of different ages and sexes from time to time, together with the total. With such statistical material as is available relating to supplies of labour we may set forth also the official returns made of the quantity of machinery at work from time to time. It hardly need be pointed out that the ratio of machinery to operatives roughly measures the efficiency of labour, other things being equal.

</table>

The figures in this table are not quite complete except for 1901: the relations between the changes shown for each class should nevertheless be accurately represented.

The most noticeable features of these tables are the decrease in the proportion of children employed and the steady increase in the number of operatives as a whole until recent years. The contraction of the body of operatives of late years seems to have occurred primarily among children and young persons (where the first check would naturally be looked for), and secondarily among adult males. If allowance be made for the smaller value of children as compared with adults, and the census results be taken, it is not evident that there has been any diminution in the amount of labour-power, and if the factory inspectors' returns be accepted, the falling off in the number of operatives cannot be proved to have had place in either of the chief branches of the industry at so rapid a rate as to have occasioned the enforced dismissal of any hands. An industry which was not recruited and in which no large addition has been made to the force of operatives during the last 18 years, although it has suffered a fall dwindle at a greater rate. At least it may be inferred from these figures, when taken in conjunction with the large increase in spinners and looms, that the output per head has considerably advanced in spite of the rise in the average quality of both yarns and fabrics produced. This raises the value per unit of the output accounts to some extent for the fact that wages have not been adversely affected of late.

Mr. A. L. Bowley has calculated index numbers of wages for the leading trades, including the manufacture of cotton. Those for the cotton industry and the leading cotton trades, including the manufacture of cotton, are given below, together with averages for cotton and woollen workers, the building trades, mining, workers in iron, sailors, compositors, and agriculturists (England), the numbers in each class being allowed for in the average. Side by side with these figures, Sauerbeck's index numbers of general wholesale, prices are given, together with the average prices of wheat per quarter.

The figures given above for cotton workers and average wages for eight trades do not measure the differences between each, but only the differences between the movements of each. Actual average money wages in the cotton industry have probably been approximately those stated in the second table beneath, but as these figures are culled from various sources they must not be taken to indicate fluctuations.

1 Average for 1898 and 1899.
2 See chapter on cotton in Bowley's Wages in the United Kingdom and Table there given.
3 Average for a slightly different group.
As employers, four extensive associations include almost all the organization among them, two concerned chiefly with spinning and two with weaving. The former two are the Federation of Master Cotton Spinners’ Associations with local associations and the Amalgamated Association of Master Cotton Weavers (founded 1884), the Amalgamated Association of Carding and Ribbon-Rowing Operatives (established 1886), and the Amalgamated Association of Power-loom Overlookers (founded 1884). These are the three first of the four associations, for the term “federation” must not be taken in any strict sense. The distribution of power between the central authority and the local societies varies, but in some cases, for instance among the spinners, the branches are autonomous, while in other cases, the term “federation” must be understood to mean that each independent unit federated for limited objects. We ought also to mention the societies of warp-dressers and warpers, tape-sizers and cloth-workers and warehousemen. There is no one federation of all cotton-workers, but the United Textile Factory Workers has been periodically called into being to press the matter of factory legislation, and international textile congresses are occasionally held by the operatives of different countries.

The Cotton Industry outside England.

A brief survey will now be made of the cotton industry in parts of the globe other than the British Isles, and as a prelude the following broad estimates of the numbers of spinners and looms in the United Kingdom, the United States, and the continent; and finally we may add the figures of cotton consumed.

The different average fineness of counts spun in different places must be borne in mind when the consumption of each district at the same time is being considered, but the relations between the amounts consumed in the contrasted districts in the two periods would not be affected much by this difference.

1 A detailed analysis of the whole labour question in the cotton industry will be found in Chapman's "Lancashire Cotton Industry." The table is further supplemented by the figures for the number of spinners at different times in the United Kingdom, the United States, and the continent; and finally we may add the figures of cotton consumed.

2 The figures for looms are based upon the number of returns and estimates. Those for spindles are taken from the highly authoritative, estimates of the International Federation of Master Cotton Spinners.

Roughly the consumption of cotton per spindle in the three areas to-day is, in lb, 35 for the United Kingdom, 70 for the continent, and 95 for the United States.

Before the cotton industry in other countries is described it will be necessary to explain how it could have developed there on a large scale at all. Of course this growth is to be accounted for very largely by the natural protection of cost of transport aided by tariffs. But it would be a mistake for Englishmen to imagine that all foreign cotton mills are the product of a forcing culture, and that if the favourable conditions created by import duties were removed they would totally disappear. No doubt some of the growth is artificial, but much is natural and would have taken place under universal free trade conditions. Much of it, indeed, would have appeared in these circumstances even were cost of production a negligible quantity, difficult though it may be at first to reconcile this statement with certain ordinary conceptions of the operations of the law of increasing returns. Lancashire secured an immense lead at the beginning of the 19th century, and if the cost of production may be represented as varying inversely as the magnitude of the industry, every addition to her success increased her advantages. How could the small industry, with a high cost of production because it was small, compete with Lancashire? The answer is to be found in the peculiar conditions governing international trade and a closer analysis of the "increasing returns." "Increasing returns" in any place are a function of two variables, (1) the magnitude of the world market under conditions of world commerce, and (2) the magnitude of the industry in the spot in question. The economies connected with the first variable, which in such an industry as the cotton industry are enormous, and the best industrial and commercial limits of business specialization, are shared by every national section of the industry whether it be great or small. If Haiti started a cotton factory she might import all her specialized machinery—the specialization involved in producing which is dependent upon the exportation of some of it—and restrict narrowly the work undertaken by her one factory. The cotton goods outside this range she would still import, and if her specialized product were in excess of local demand she could export some of it, if she were favourably placed in respect of cost of carriage, for cost of production in Haiti would not be impossibly high, since machinery and the general system of production would be quite up to date though labour might be highly inefficient. Of course, the country with a large industry enjoys high local economies, so it might be thought that these alone would be a menace to the stability of the small industry, because if the industry in the favoured locality increased these would increase also and the small industry would be undersold. The answer to this difficulty is that foreign trade depends upon ratios between ratios, that is, upon the ratios between the costs of production of all the products of each country in relation to similar ratios for other countries. Relatively, therefore, diminishing returns operate in every country. In every country there must come a time, the utility of commodities being taken into account, when a unit of labour and capital provides less utility when applied to the creation of cotton goods, say, than when applied to producing something else for home consumption or for export in exchange for commodities wanted at home. It becomes apparent, therefore, that cotton industries of widely varying sizes dispersed throughout the world can settle into relations of perfectly stable equilibrium, as that term is understood by the economist. Slow changes, of course, in their relative volumes might be looked for with changes in a mutable world, but very sudden collapses would be impossible unless the general course of human affairs were revolutionized.

The United States.—The machine-cotton industry was carried to North America almost as soon as it evolved in England. Models of Arkwright's machines were smuggled across the Atlantic in 1786—Arkwright's first mill had not been started in England until 1769—and these with a Jenny and stock-card were publicly exhibited. From these models a great mass of machinery was soon constructed. The first mill was erected in 1788 (that of the Beverly Association), the second appeared in 1790, the third five years later, and in 1798 Samuel Slater started with some of his wife's relatives the first mill in which the principle of the water-frame was carried throughout. It is said that it was not until 1814 that power-loom manufacturing was commenced, but in England success with the power-loom was long delayed. As early as 1831, however, there were in the United States—mainly in the New England states—800 factories, a mill and a quarter spindles, 33,000 looms and 62,000 operatives. At this time the annual consumption of cotton was 17,000,000 lb as compared with some 300,000,000 lb in England. At the same date, and 2,000,000 lb approximately in the United States at the present time. Writing in 1840, James Montgomery said that, in respect of cost of production, the American industry was 10% behind that of England apart from the cost of raw material, which was then a good deal less to the Americans. In 1878, when there was much interest in the question of British efficiency in the cotton industry because the passage of the Factory Act of 1874 had cut down the working hours, the Economist contrasted the result of twenty-five years' growth in England and America:—

"In 1853 the average English production per weaver of 81 lb shirting was 825 yds. per week of sixty hours. In 1878 the working hours had fallen to sixty-seven, and the production had risen to 925 yds. An increased production of 23% is thus due to the improvement in the processes of manufacture. In 1865 there were 24,151 persons employed in Massachusetts in the production of cotton goods, and they produced 175,000,000 yds. In 1875 the operatives numbered 60,176, and their product was 875,000,000 yds. The operatives had increased 150% and their products had increased 500%. The increase of production due to improved methods was thus in England 23% and in Massachusetts 100%. I do not, of course, believe that the American is of English origin; of course the Americans of his English rival to the extent of this difference, for I presume that he started upon the career of improvement from a lower platform. But a progress so greatly more rapid than ours will be advanced to cast much light on the change which has occurred in our relative positions."

The contrast no doubt was not perfect, as indeed it could not be.
Cotton small wares are included in the totals for 1880 and 1890, but excluded from those for 1900 and 1905. We must observe further that "capital" is a vague term. Recent events in the United States afford a valuable empirical indication of the effect that improved machinery actually has upon wages. The new automatic looms caused a saving of labour per unit of product which recalled the complete subversion at the industrial revolution of the proportions in which the several factors in production were organized. Displacement of labour and falling wages might not unreasonably have been looked for temporarily, but wages stuck at their old level or rose. The rise was caused by numerous converging forces which brought their united weight to bear. First, prices so fell as the result of the new machinery that the increased volume of commodities which the market could absorb more than counterbalanced, it would seem, the labour-saving of the new machinery, the cotton industry being taken as a whole. It must be remembered that to increase the output from the subsidiary processes where labour had not been saved more hands had to be drafted in. Thus, a contraction of the body of weavers was accompanied by an expansion of the body of cotton operatives. Again weavers' wages were naturally raised in a special degree because automatic machinery called for quick, trustworthy and intelligent hands, endowed with versatility, especially in the days when the machinery was still in the semi-experimental stage. The American employer tries to save in labour but not to save in wages; if a generalization may be ventured. The good workman gets high pay, but he is kept at tasks requiring his powers and is not suffered to waste his time doing the work of unskilled and boy labour. There is, certainly, in the American labour problem no serious grievance on the question of wages. If there is any abuse it consists in excessively fierce work. Mr. T. M. Young, who visited the American cotton districts in 1904 with an informal commission of Lancashire spinners and manufacturers, did not think that the cause of the high wages—allowance being made for the purchasing power of money, they are above those of England, though cotton operatives in England are well paid relatively—was the superiority of the American cotton worker; neither did the representatives of the English cotton operatives who accompanied the Moseley Commission. As often as not the cotton operative in the United States is a French Canadian, a German, an Italian, a Hungarian, an Albanian, a Portuguese, a Russian, a Greek, or an Armenian. 4

The character of the growth of the cotton industry in the United States, as revealed by recent census returns, is peculiarly interesting:

3 Memorandum on British and foreign trade and industrial conditions.
4 The method of calculating these percentages is discussed in the blue-book mentioned.

spindle might have risen; or the latter remaining constant, counts might have been getting finer. Speeds have certainly gone up a good deal of late on some counts. And it is quite likely, too, that concentration on the manufacture of coarse goods for export, with stout warps to keep down the
breakages and raise the output per loom, may be reckoned as one cause.

Despite the recent sensational growth in the South, the New England States still remain the most prominent seat of the American cotton industry. They contained in 1905 about 14 million spindles as compared with 7.7 millions in the South and West, and their relative possession of looms approaches, though it does not quite reach, the same proportion. The leading States in the South in order of importance are South Carolina, North Carolina, Georgia and Alabama, and in the North, first Massachusetts with an enormous lead, then, in order, Rhode Island, New Hampshire, Connecticut, Maine, New York, Pennsylvania, New Jersey. The bulk of the cotton industry in the North is contained within a small area. A circle around Providence, Rhode Island, of 30 m. radius includes, according to the twelfth census, nearly 71 million spindles,—there were only 56,500 spindles in this area in 1869. Of the chief towns Fall River stood first in 1900 in value output, and was followed in order by Philadelphia, New Bedford, Lowell, Manchester and Pawtucket. The climate of Fall River is very similar to that of English spinning districts. Its population in 1900 was 105,000, and of these only 14,600 were of American parentage. Of the remainder, 16,700 were English, 17,800 Irish, 29,600 French Canadians and about 5000 Portuguese. Among the rest of foreign parentage, Armenians, Russians and Italians are numerous. But Massachusetts is famous for the number of immigrants it attracts. It is almost incredible, but nevertheless a fact according to a recent statistical report, that in 1903 as many as 91% of the cotton operatives of the State were of foreign descent—chiefly French Canadian and Irish. In 1902 there were nearly 90 mills at Fall River with 3,000,000 spindles and 16,000 looms. The spindles amount to about one-third of all in Massachusetts, but Fall River's share of the looms of the State is not large. The spindles exceed in number those possessed by any State except of course the one in which it is placed. In comparison with a great spinning town in England, nevertheless, Fall River does not appeal strongly to the English imagination. It has little over a quarter of the spindles of Oldham, or three-fifths of those of Bolton,—among English towns it would stand third, i.e. between Bolton and Manchester and Salford, which, in spite of the movement of spinning to the hills, still holds in England a leading place. The whole of Massachusetts, it is of interest to observe, has fewer spindles than Oldham, and only about half those of Oldham and Bolton together. Originally it was the river which attracted the mills to Fall River, and as the water-power available was almost inexhaustible, it was possible for the mills to congregate together and for a town to grow up. In England, when much of the industry was dependent for power upon water, decentralization was entailed, for the thin streams of Lancashire could not support more than two or three mills at most in proximity. Hence in England, after Watt's steam-engine had succeeded, the economies of centralization led eventually to the desertion of the mills on the water-courses. But at Fall River the perfecting of the application of steam-power merely involved its use to supplement the water-power on the old site. The presence of water-power explains half the success of New England. In the six States 35% of all the power used is derived from water, and in the cotton-manufacturing of these States water provides 32-6% of the power. For industrial purposes generally the river most exploited is the Merrimac, upon which stand the leading cotton towns of Lowell, Lawrence and Manchester. Hitherto little has been done in the way of using water to generate electric power.¹

The two most striking features of the American industry to-day are the introduction of the automatic looms, already briefly referred to, and the development of the South. The Northrop Loom Company has spent a fortune in pushing its loom on to the market. It has not hesitated to share risks, and it has run one "advertisement" mill at least, namely that at Burlington, Vermont, with 55,000 spindles and nearly 1300 looms. In this mill the labour-saving is shown by the following figures, the looms being of two sizes, 32 in. and 44 in. Of the former, 3 weavers run 18 each, 30 tend each, only a few odd weavers tend less than 16, and learners even are at work on 8 to 11 each; on the latter, of 29 weavers 17 mind 16 looms each and 12 mind 12 (on stripped fabrics).² Of course a high level of efficiency would be expected in this show mill. That American employers have readily been converted to a belief in the economy of the new machinery we are not astonished to learn in view of the American temperament, the intensity of competition among business leaders, and the prevailing spirit of adventure. Thousands of workable old looms have been scrapped, and probably at the present time there are 100,000 automatic looms running in the United States. No other country can point to a rate of substitution which approaches that in the United States. The causes, apart from the temperamental and social to which reference has already been made, are probably (1) that there is disagreement as to the present economy of automatic looms on many fabrics; (2) that Americans aim at frequency of renewal of plant, and avoid making their machinery so durable as to prove ultimately, perhaps, a handicapping inheritance, and (3) that a greater bulk of American work is appropriate for the new looms than of English or continental work. But automatic machinery is being used increasingly in Lancashire.³ And the operatives ultimately benefit. It is the half-developed machine, to which labour must actually be linked as an essential part, which is responsible for monotonous work and creates the dislike of mechanical aids.

Now we turn to the recent development of the Southern States. Never has an industry grown faster than that of the two Carolinas, Georgia and Alabama. Some of the earliest experiments with the machine industry were conducted in South Carolina, but from that time till the end of the 19th century nobody imagined the possibility of a great Southern expansion. In 1880 the South contained less than half a million spindles—i.e. about as many as Hyde, Middleton or Chorley, and one-twenty-third of the numbers in Oldham. Twenty years later they had increased twofold and the Southern States, in respect of the number of spindles, had taken precedence of Bolton. To-day probably about eight and a half millions might be counted. In addition there are some two hundred thousand looms, or nearly as many as in the three leading cotton-weaving towns of England—Burnley, Blackburn and Preston. The rapid oncoming of the South may also be traced by its consumption of cotton—which as an index, however, is not perfect. This on an average was, in thousand bales, 104, 266, 453, 717 and 1233 in each of the periods 1876-1880, 1881-1885, 1886-1889, 1891-1895 and 1896-1900 successively. The consumption since then, as compared with that of the Northern States, Great Britain and the European continent, has been as follows. It must be remembered that the consumption per spindle varies greatly from place to place.

### Consumption of Cotton in Thousand Bales of about 500 lbs each.

¹ Upon the above see Uttley's report.

² The figures are those quoted by Mr T. M. Young and relate to the year 1902.

³ See e.g. some passages upon this point in Utley's report.

4 For an account of the numerous types of automatic looms see the article on Weaving: Machinery.
radius of about 100 m. Of the remainder a large proportion is scattered over a wide area.

Much interest has been excited by this newly created Lancashire of a new type, and much speculation as to the causes that account for it has been elicited. An informal commission of Lancashire spinners and manufacturers crossed the Atlantic to make inquiries in 1902 and investigations have been undertaken by other persons, and much has been written on the subject. A general explanation can now be framed without much difficulty, as in all probability most of the relevant facts have been brought to light. First and foremost the general development of the cotton industry in the United States must be emphasized. The industry was unquestionably foredoomed to expansion at this time, and the only question was where the expansion should take place. It was plain that the growth might be so great as to present the appearance of a new industry created with new labour rather than an extension of an old industry. It was not altogether surprising, therefore, that the exploitation of a new field of labour was thought of. The labour market of the North was comparatively exhausted; in less developed parts of the country larger supplies of intrinsically good labour might be looked for at lower wages. Skill was not a matter of much moment, because in the North it would have been necessary to incorporate much labour without previous experience in the industry, the work was intended to be of the rough kind upon which manual skill is least important, and it was intended to repossess reliance for economy upon machinery in the main. The choice of new fields meant at the outset the sacrifice of some of the economies of localization, but so large an expansion was looked for that projectors did not despair of creating fresh industrial localization of sufficient magnitude to produce such economies as are derived from it, which, it must be observed, are inconsiderable in America, and have declined relatively with falling cost of transport and the adoption, as regards machinery, of the principle of interchangeable parts. And at any rate a new local industry would have a slight advantage in supplying markets in proximity to it.

These were the main general considerations, and the scale was turned in favour of the new locality (a) by the advantage of nearer supplies of cotton, and (b) by the known presence of much half-occupied white labour in the vicinity of otherwise suitable sites close to the cotton-fields. It must be borne in mind that the whole calculation had not to be reared merely upon an intangible theoretical basis. Cotton mills already existed in the South, and comparisons of costs of production, as things were then, afforded some groundwork for judgment.

As regards the first of the two special advantages mentioned above, the saving in the cost of carriage of the raw material is not commonly held to be high. Transport to the cotton ports is so well organized and sea-transport is so cheap that Lancashire's distance from the source of her raw material is not a very appreciable handicap. A good deal of the cotton that must be used in some of the Southern mills cannot be supplied locally because it is not grown in the neighbourhood, and the requirements of these mills are met by transport arrangements which at present cost a sum not altogether out of relation to similar costs in the New England States and Lancashire. The percentages of freight charges on raw material in 1900 were $2-18 in Georgia, $1-50 in North Carolina, $1-67 in South Carolina, and the amazingly low figure of $1-20 in Massachusetts, but of course some part of the explanation is the somewhat higher quality of cotton on an average that is worked up in Massachusetts. For some years, however, the saving in labour has been a most important economy. Large supplies of half-occupied white labour existed in the Southern States among the families of small farmers who looked South after the Civil War, and in the districts of the decayed hand industry in the mountains of Kentucky and North Carolina. For small money wages much of this labour could be attracted to the mills. Negroes do not work in the mills; the reason is said to be partly their own disinclination and partly that they are not very efficient at factory work. As outside labourers, however, they have afforded important aid at a very trifling cost, but the expense of outside labour to a mill is never an item of much weight. The halcyon days to employers, when keen workers could be had for low wages, are now said to be past. The demand for labour was considerable, and as time went on additional supplies could be enticed only with the offer of better pay. In 1904 it was reported that some mills were unable to get fully to work for want of hands even at the improved rates. Again the Southern operatives have been visited by emissaries from the operatives of the New England States, which explains partly the present aspect of the wages question. Mr. Pidgin, in his official report to the Massachusetts Bureau of Labour Statistics, questions whether a saving in wages can be expected to continue, and points out that though wages have been low the average efficiency of the operatives has not been high. Some, indeed, were sent to gain experience in Northern mills in the hopes that on their return they would spread the tradition of working at high pressure. Mr. Pidgin is at some pains to measure labour efficiency in the South and North as far as it is possible to do so, but no simple sets of figures will prove very much. The value of the product per operative in 1900 was $1200 in Massachusetts, $1010 in Georgia, $937 in North Carolina and $894 in South Carolina, but the value of the product per operative depends as much upon the fixed capital charge per operative as upon the latter's efficiency. And the amount of machinery used per head is higher in the South than in the North. The percentage of operatives to machinery in Massachusetts being expressed as 100, that of Georgia was 53, that of North Carolina 43 and that of South Carolina 55 in 1900. These figures must be borne in mind when the average numbers employed in a mill in different States are being considered: in 1900 the averages were 565 for Massachusetts, 273 for Georgia, 171 for North Carolina and 375 for South Carolina. Measured by quantity of machinery the sizes of mills would stand in quite different relations. Hours of work in the South are bound to fall and the abuse of child labour, which had unquestionably crept in, may be expected to discontinue thereby. The factory conditions of children are better now than they were, but in some places they are still very bad. In Georgia no children under twelve are employed, but infants without fathers may begin work at ten years of age, and according to Mr. Pidgin's report, "it certainly seemed as though the intention was honoured more in the breach than in the observance, or that there must be many widows in the neighbourhood of the cotton mills." In North and South Carolina the employment of children under twelve is illegal, but in these States also conditions are recognized under which it is possible to employ them earlier. According to figures relating to 1900 the dependence on child labour in the Southern States is very striking. The proportions engaged at different ages in the three chief cotton-manufacturing States and Massachusetts are as follows:

<table>

It might be said that children are more useful when the work is rough, but this argument can hardly be regarded as accounting altogether for the great discrepancy as between Massachusetts and the South. The work is much rougher in the South: in 1900 the counts spun respectively in Massachusetts, Georgia, North Carolina and South Carolina were 25-10, 14-97, 18-83, and 19-04, and on the showing of the American census of 1900 spinning was getting fonder over the last decade of the 19th century.

As contributory to the influences already recorded as accounting for Southern success it has been hinted that in the North employers have been less ready to welcome the new machinery, though in comparison with European rivals they would seem to

---

1 Of which special mention may be made of Utley's report as a Gartside scholar of the university of Manchester, already referred to, and Pidgin's report for the Massachusetts Bureau of Labour Statistics.
first to have acted rashly. However this may be, the South enjoyed the important advantage that its industry began just after a great technical advance had been made. When Northern mill owners were anxiously deliberating about the destruction of good machinery merely because it was antiquated in design, the fortunate Southern mill-proprietor was getting to work with appliances up to date in every particular. It will be easier to balance comparative advantages as between North and South when undertakers in the newer district are confronted by problems concerning replacements and alterations. The rapidity of Southern growth need not astonish those who have watched the operations by which new mills are frequently set up in Lancashire and remember that the American business man is more daring than his British cousin. Company promotion in the great financial centres, payment for machinery and other plant in shares, or partially in shares, a general diffusion of risks and pledging of credit, would explain even more rapid growth of industries of even greater magnitude.

Broad generalizations are difficult to frame, hard to establish and liable to be misleading; some generalizations relating to the features of the American cotton industry taken as a whole the author is tempted to venture nevertheless. The characteristic of labour saving machinery is hardly more in evidence in Lancashire than in America; we have also noticed that the bulk of the work done is of a rough and simple character. In spite of American nationalism and the prevalence of protective sentiments it is said that there is still a prejudice in the United States against home-made fine cotton goods.1 “The product of the American system is a cloth which is, on the whole, distinctly inferior in appearance, feel and finish to that produced by the Lancashire system. To equal a Lancashire cloth in these respects an American cloth must not only be made of better cotton, but must contain more of it—perhaps 5% more. To this rule of inferiority there is, it needless to say, exceptions, notably some of the American drills made for the China market. But the American home market, which absorbs nearly the whole of the product of American looms, is less exacting in these matters than the markets in which Lancashire cloths are sold.”2 It follows that the average counts spun in the United States are lower than in England, though they have been rising somewhat. Another feature of American spinning as compared with English is the high proportion of ring-frames to mules. In New England between 1860 and 1870 mule-spindles advanced by 12,000, ring-spindles by nearly 2,000; but in the South mule-spindles increased only from 180,500 to 180,500, while to the ring-frames 2,700,000 were added. To the general rule Rhode Island is the sole exception; here mule-spindles have increased and ring-spindles decreased; but in Rhode Island much of the fine spinning—for instance that for hosiery—is congregated.3 One explanation of the preponderance of ring-spinning is to be found in the character of American fabrics. Again most of the operatives are not of a kind likely to acquire great excellence at mule-spinning. To the Americans we largely owe the ring-frame, because their encouragement helped it through the difficult period when its defects were serious, though it appears to have been discovered independently in both countries.

American organization displays intense specialism, but of a type different from that in England, where businesses are specialized by processes; in America they are specialized by products but hardly at all by processes. Independent spinning, independent manufacturing, independent bleaching, dyeing and finishing are the significant features. American industry to the birds-eye view of the United States the typical firm will spin, make up its own yarn, and perhaps complete its fabrics for the market; but the mills, it must be remembered, are intensely specialized as to the range of their product, so that the statement that American mills are less specialized than English mills must be received with caution. For some reasons we should expect to

find the American method applied even in England for fabrics of the highest qualities, because in their case the adaptation of the yarn to the fabric is more exacting than to the fabric, are of great importance, and actually where the American plan is followed in England the explanation is frequently the speciality of the product which is associated with the particular firm producing it. When a firm manufactures a speciality of this kind it cannot always trust bought yarn, or the finishing applied to fabrics in the ton. But for other reasons specialized processes might be looked for where qualities were highest, as by specialism alone can the greatest excellence be attained. The final selection of method depends upon the relative importance for high qualities in the finished product of the connectedness of processes and the perfection of parts; and to these considerations must be added cost of transport between the works devoted to distinct processes, and the development of the commercial functions by which specialized process businesses are kept functioning as a whole. Probably it is the high development of British industry on the commercial side which chiefly explains the arrangements found in England. Attention should also be directed to the huge magnitude of American businesses. This is partly a consequence of American ambition in business, and partly a consequence of the undeveloped commercial lag in Lancashire, by which producing businesses are brought into union. American producers in both North and South are too widely scattered for one town, like Manchester in the English cotton district, to be visited frequently by them for the purpose of making purchases and effecting sales. Even if the Americans did possess a convenient commercial centre, the high cost of transport between works distributed over a very wide area would prevent much specialism of businesses by processes from appearing. Writing capital letters for industrial processes and small letters and Greek letters for commercial functions, the possible arrangements in the cotton industry may be represented broadly as follows, brackets indicating the scope of businesses:4

I. (a, A, B, C, d)
II. (a, A, B, C, d).
III. (a, A, B, C, d).
IV. (a, A, B, C, d).

The American industry approximates to the first type, while the English approximates rather to the last. Differences in respect of specialism by range of product are not shown in the formula.

Other Parts of America.—Little need be said of the cotton industry in other parts of the New World. In Canada in 1909 there were, approximately, 855,000 spindles, and in Mexico in 1906, where the first factory was established in 1834, 450,000 spindles. In Brazil also there is extensive manufacturing; in 1893 there were 250,000 ring-spindles distributed in 134 factories, which are located chiefly in Rio de Janeiro and Minas Geraes, and are run for the most part by railways and water-wheels.

In Germany the cotton industry is by no means so intensely localized as in England, but three large districts may be distinguished:

1. The north-west district, which consists of the Rhine Province and Westphalia and contained 11 million spindles in 1901.
2. The country north of the mountain ranges of northern Bohemia comprises the middle district, which contained 23 million spindles in 1901.
3. Saxony has the industry carried on for four centuries.
4. Alsace, Baden, and Wurttemberg have some 13 million spindles, some of which were assigned in 1904 to the south-west district, to which some 3½ million spindles were assigned.
5. It is in close proximity to the cotton districts of east France, Switzerland, and Vorarlberg.

According to Oppel (1902) the German spinning industry is chiefly localized in

| Prussia with 20 thousand spindles |
| Saxony with 20 thousand spindles |
| Alsace with 20 thousand spindles |

The spindles of Württemberg, which stands next, do not much exceed half a million. Only sixteen places in Germany (shown in tabular form on p. 169) contained as many as 100,000 spindles in 1901.

The history of the hand industry in Germany runs back some centuries. At the time when it flourished in the Netherlands we may be sure that it was prosecuted to some extent farther north and east. The start with the machine industry was not long

1 Textile Recorder, August 15th, 1905.

3 Uttley’s report, p. 4.
4 Similar formulae have been used above, where a fuller explanation is given.
COTTON MANUFACTURE

297

delayed after its economies had been learnt in England. It was fostered by protection against the cheap products of Lancashire, and in the course of time stimulated by every step taken towards the economic unity of the German states which broke down local barriers and therefore enlarged the German market. Duties upon cotton goods, however, were not immediately high until the measure of 1879, the policy of which was carried to a further stage in 1885. Slight reactions were brought about in 1888 and 1891, largely by the complaints, not only of the consumers of finished goods, but also of manufacturers whose costs of production were kept up by the high prices of home-spun yarns and the tax on imported substitutes. According to the investigations made by the Board of Trade, the general and indirect impact of German duties on British goods stood somewhat as follows in 1902:—

Statement showing the Average Incidence (ad valorem) of the Import Duties levied by Germany on British Cotton Goods.

The duties are not prohibitive—they are much less than those of the United States at the same time—but they are heavy on the classes of goods which come into competition with home-made goods. The general principle of the tariff is to treat easiest commodities which are made with least success at home, or are in the highest degree raw material for a home manufacture. Therefore yarns are not taxed very heavily, and of these the finest counts escape with slight discouragement.

In the cotton industry, as well as in numerous other industries of Germany, almost feverish activity was shown after the Franco-German War. Previously great advances had been made, but it was not until the last quarter of the 19th century that Germany forced herself into the first rank. As measured by the annual consumption of cotton the German industry increased as follows:—

Metric Tons of Cotton per Annum. (In Thousands.)

1836-1840 | 9
1856-1860 | 46
1876-1880 | 124
1886-1890 | 201
1899-1903 | 324

It must be remembered that the spindles and looms of Alsace and Lorraine were reckoned as German after the war; they amounted in 1895 to one and a half million spindles and nearly forty thousand looms.

In the 'seventies there was no dispute as to England's substantial lead in respect of efficiency. Alexander Redgrave, the chief factory inspector, made inquiries on the continent both in 1873, when Lancashire was anxious as to the comparative cost of production abroad because of the sharp competition on the Continent; and previously, and reported most unfavourably upon the state of the industry in Germany. Hours were long, the skill of the hands was inferior, speeds were low and time was wasted. In several important respects his views were corroborated by a visit in 1876 to the German North and by the evidence adduced before the German commission upon the cotton and linen industries in 1878. A marked contrast is noticeable between the sketches drawn of this period and the careful picture presented by Professor Schulze-Gaevernitz of the early 'nineties,' but even in the latter the advantage of England is represented as substantial in every essential respect. The gap which existed has narrowed, but it is still unmistakable. To give one example, according to Dr Huber's figures there were in Saxony at the end of the 19th century 106 spindles to an operative and about as many weavers as looms, whereas in England there were about twice as many spindles and tet spindles to an operative and twice as many looms as persons engaged in weaving sheds.1 As regards manufacturing, the character of the product may partly explain the difference, but it will not entirely. The reader need hardly be warned that the comparison drawn is exceedingly rough. German cotton operatives taken all in all are not inferior to Englishmen, and yet they are of the same kind. The reason is partly that the proportion of the German workpeople who have been long specialized to the industry, and look forward to continuing in it all their lives, is not high. Complaint is often made that the children are created in the mills each year by operatives leaving, and of the impossibility of filling them with experienced hands. Many of the vacancies are caused by the return of workpeople to the country parts. Sometimes in the country districts wages are quite low, and work is obtained from the unoccupied members of peasants' families. In these cases the factories do not always succeed in attracting the most capable people, and work in the factory is not infrequently looked upon as a makeshift to supplement a family's earnings. Among Lancashire operatives far more pride of occupation may be met with. In many of the industrial parts of Germany English conditions are evolving, but they are not generally the rule. An American consul may be taken to report to his own country customarily that in Germany wages are lower, but that the English conditions: 'one such wrote in 1901:—'The task of educating labour up to a high degree of efficiency is difficult, and many generations are necessary to achieve that result. Professor Hasbach in Schmollers Jahrbuch (vol. ii., 1903). The author tries to show that Germany is not so far behind England industrially as is generally believed, and the contrast drawn between them, greatly to the advantage of Lancashire, is not likely to exaggerate the superiority of English conditions. It is calculated by Professor Hasbach that the daily wages of spinners are about 1/3 to 1/4 of what they would be if the same work was done by English operatives. The wages paid to the big piece in England, Dr Hasbach goes on to show, is not much greater than that received by a good assistant in Germany. This comparison as it stands will probably give some readers an idea that English advantages are greater than they actually are, because it may be overlooked that the great difference between wages in the case of English and German spinners is not repeated among the piecers. Taking a spinner and his first assistant as the unit, we should have a joint average daily wage of about 8/6 in England and 6/6 in Germany. In the case of weavers, comparison of wages is more difficult to draw, but the advantage of England would seem to be but little less. However, in instituting a comparison between as many countries as possible, it should be remembered that the relative cheapness of labour in some industries, we should do well to remind ourselves that efficiency is a somewhat transitory thing, dependent upon education and experience as much as upon aptitude. In the respect of the labourers, at least, the tables are not turned. We could not (writing in 1907) make the statement that England leads significantly with the assurance with which we can assert her superiority in respect of present attainments. The cotton industry has not been much affected by the change in the relation between costs in England and the Germans have not, therefore, had the same opportunity for developing their latent powers. But the thoughtfulness and carefulness of the German workman are beyond dispute, and the industry interests the future of the world, and it is not mechanical. Already in the cotton industry it is said that the operatives are displaying quite striking powers of undertaking a wide range of work and changing easily from one pattern to another. Hence German firms feel little hesitation in taking small orders for special designs; they do not experience any great difficulty in getting their factors accommodated to produce the required articles.

Apart from the efficiency of labour, reasons exist for the lower

1 Deutschland als Industriestaat.
COTTON MANUFACTURE

real cost of production in England in the organization of the industry.

The cotton mill is not only less costly, but, as we might perhaps infer from that circumstance, less specialized. A German factory may turn out scores of patterns where an English firm will confine itself to a few specialties. Time is wasted in accommodating machinery to changes and in accustomed to the hands to the new work. The German producer suffers from the undeveloped state of the market. In England specialized markets with specialized dealers have greatly assisted producers both in their buying and selling. A German manufacturer sells directly to his customer. England could not; at least, so Professor Schulze-Gaevernitz has assured us, and conditions have not been wholly transformed since he made his careful analysis. He wrote: "But especially disadvantageous is the distribution of cotton in this market. The German manufacturer stands under the same disadvantages with which the English had to struggle in the 'thirties. The German manufacturer still seeks his customers through travelling agents, and in many instances through retail sellers. The financial standing is questionable, whose necessity for credit is always certain. Hence the complaints about the bad conditions of payment in Germany which crop up continually in the trade. The manufacturers had to wait three, four or even twelve months, and even the landed gentry could not follow the fashion in Australia and South America; the foreign buyer cannot travel from mill to mill."

It is the want of commercial development in Germany which accounts for the more frequent combination in London and spinning in Germany. But in Germany the to-day economic enterprise is flourishing, and commercial development may confidently be looked for together with advancement in other directions. It is not many years since the typical German cotton factory was constructed entirely of wood. Weaving machinery alone which might have been erected recently in Oldham. Between the early 'eighties and the 'nineties the expansion of the German industry was enormous. The imports of cotton-wool rose by nearly 70%—yet the number of spindles increased from 350,000 to 2,450,000, while the number of weaving-sheds fell from 56,000 to 32,750. At the same time the factories devoted to mixed goods declined from 28,000 to 12,350. From these figures we may gather how rapidly the average size of the weaving-shed has increased and the organization of the factories, with a doubt, that improved economies in the German and foreign factories which we shall have to consider in any other direction.

There were recently about twice as many persons engaged in weaving as in England, the average number of spindles per person of weaving sheds—were the persons occupied in the manufacture of cotton-lace, trimmings, &c. As we might imagine, Germany's exports of cotton goods are not high. Including yards they amount to £25 million per annum. Spindles and looms are mainly exported; the exports of Germany are cheaper, and of lower quality, than those of England. The wages of Germany are cheaper, and the population of France design was always to secure for her goods a place in the first rank. As regards artistic results France leads, but the real cost of her spindles and weaving cannot approach in lowness that of Lancashire. After costly strike the French industry was in decline. The French Revolution was made, French tariffs were found to bear upon British cotton goods with about the same severity as for goods of France, except that the former treated more hardly yarns and cotton thread for sewing. French cotton millers have kept down their exports; as such as the majority proceed now to her colonies. Normandy, the north and east, in order, are the chief seats of the industry. In Normandy the leading city is Rouen, and Darnétal, Maromme, Sotteville, Havre, Yvetot, Dieppe, Evreux, Gisors, Falaise and Flers are important places. The north contains the

important towns of Lille, Tourcoing, Roubaix, St Quentin, Amiens and Hellemines. The Vosges is the chief district of the east, and the leading towns are Epinal, St Dié, Remiremont, Senones, Val d'Ajol, Corrémont and La Bresse. The following towns which are not included in any of the districts mentioned above are also noteworthy: Troyes, Nantes, Cholet, Laval, Tarare, Roanne, Thizy and Villefranche upon the Saône. Cotton arrives at Havre and Marseilles; at the latter chiefly the product of Egypt and the East. Havre has been the most important cotton port in continental Europe, but to-day many spindles are fed from Bremen than from Havre. France's consumption of cotton annually in the period 1899–1903 was 210,000 metric tons.

Russia.—Power-spinning was carried into Russia by Ludwig Knoop, who had learnt the trade in Manchester, and to his efforts its early success was due. Knoop was shown the factory in 1873, but to-day many spindles are fed from Bremen than from Havre. France's consumption of cotton annually in the period 1899–1903 was 210,000 metric tons.

Fine spilling has been attempted only recently. Generally speaking, 70% of the lower cotton is the upper limit, but now counts up to 140's are tried, though the bulk of the output is coarse yarn. The inefficiency of the labour was made abundantly plain by Dr Schulze-Knoop's economic study of Russia, and conditions have not greatly altered for the better since. Roughly, 170,000 operatives worked 6,000,000 spindles in 1900, which means 55 spindles per head as compared with more than 100 in Saxony and 70 in Lancashire. Fine spindling is mainly limited to the weaver. The speed of machinery can be computed and we must remember that the above contrasts are rough only, and made without regard to differences of style. Russia is encouraging the growth of cotton at home. But the average quality is inferior, but 100,000 tons from the provinces of central and Trans-Carpathia, were used in 1900; her imports in the same year were about 170,000 tons.

Switzerland.—Swiss spindles advanced until the early "seventies," but a decline followed. Details are:

The falling off is occasioned mainly by (a) the developing industrialism of the rest of Europe, notably Germany, and (b) the diminishing importance of the natural advantage of water-power with the
improvement of steam-engines. Swiss yarns have been kept out of continental markets in the interests of home spinning. Now fancy cotton goods, laces and trimmings are the leading specialties of the Swiss textile workers. About half the Swiss spindles are in the canton of Zürich, between a quarter and a third in Glarus, about the same in St Gall and 9% in Aargau. Figures show that the average size of the Swiss mill is small. The average spindles to a mill were 22,000, and very few mills held more than 50,000 spindles. Some 9,000 of the power-looms are in Zürich, some 4,500 in Glarus, and 4,000 in St Gall, in the south-east of the canton of Zürich is an important centre of the muslin manufacture.

Austria.—Austria contains about 4,200,000 spindles and more yarn is consumed than it produces, as on balance there is an excess of imports of yarn. Bohemia, Lower Austria, Tirol and Vorarlberg account for the mass of Austrian spinning. The following details relating to these districts recently are of interest:

<table>
<thead>
<tr>
<th>District</th>
<th>Mills.</th>

</tr>
</tbody>
</table>

Reichenberg and the surrounding district is the chief manufacturing place. There are more than 80,000 spindles, nearly a half of which are hand-looms.

Italy.—Recent industrial growth in Italy is remarkable: statistics of spindles since 1870 are as follows, but the percentage of effort is probably high:

<table>
<thead>
<tr>
<th>Year</th>
<th>Spindles.</th>
</tr>
</thead>
<tbody>
<tr>

The district between Milan and Lago Maggiore contains several villages devoted to the cotton industry. Many of the factories in the province of Bergamo are situated in the Valle Seriana, which is endowed with abundant water-power. In this district coarse and medium yarns and grey cloth are the chief products. In the province of Milan there are several small towns, notably Galliate, Busto Arsizio and Monza, in which the manufacture of coloured and fancy goods is extensively carried on. The finest spinning in Italy is done in Turin. The coarsest spinning is done in Venetia.

The Netherlands.—The Dutch trade is chiefly based on the Netherlands and London. Seventeen mules bearing 16,000 spindles are said to have been smuggled across the Channel, while forty Englishmen were enticed over to work them, in spite of English legal prohibitions. Liévin Bauwens was the principal manufacturer, and the Spinning Machine for Exports was the result of the war between the United States and France. The British machine was introduced into the Netherlands from England in its factory form. Seventeen mules bearing 16,000 spindles are said to have been smuggled across the Channel, while forty Englishmen were enticed over to work them, in spite of English legal prohibitions. COTTON MANUFACTURE

relating to the inception of the power-industry are quoted from a Diplomatic and Consular Report of 1895—

"The initial experiment on modern lines was made in 1891, when a semi-Chinese official stationed at Shanghai—the Chinese Cotton Cloth Mill and the Chinese Cotton Spinning Company. Its originators claimed for their machines a quasi-monopoly, and excluded outsiders who were not prepared to pay a fixed royalty, for the privilege of engaging in similar undertakings. Although certain Chinese accepted this onerous condition, foreigners resented it as an undue interference with their treaty rights, and it was only when, in 1895, after her war with China, inserted in the treaty of Shimonoseki an article providing for the freedom of Japanese subjects to engage in all kinds of manufacturing industries in the open ports of China, and permitting them to import machinery for such purposes, that outsiders were afforded an opportunity of exploiting the rich field for commercial development thereby thrown open. Accordingly, so soon as the Japanese treaty came into force no time was lost in turning to the parts of China, and an inspection of no less than 11 mills—Chinese and foreign—was taken in hand.

At that time the pioneer mill, which was burnt to the ground in October 1893, but subsequently rebuilt, and other Chinese-owned mills were together working some 120,000 spindles and 1200 looms.

By 1905 the mills increased to 17, the spindles to 620,000 and the looms to 2250, but there is little inclination to expansion, the hand-loomed yarns are obtained mainly from India and secondarily from Java.

The following are the recent figures relating to imported yarns:

With amazing adaptability the Japanese have assumed the methods of Western civilization as a whole, and have power-woven more than holds its own, and power-weaving has as yet met with little success.

The custom already mentioned as a cause of the continued triumph of the hand-loom in India and China is strong also in Japan, and the economy of the factory system is greater relatively in spinning than in manufacturing. In Japan it is ring-spinning which prevails; 95% of the spindles are on ring-frames.

Ring-spinning entails less skill on the part of the operative, and ring-yarn quite satisfactory for the sort of fabrics used most largely in the Far East. The counts produced are low as a rule. Generally mills run day and night with double shifts, and the system pays off, though night-work is found to be less economical than day-work there as elsewhere.

More operatives are placed on a quantity of machinery in Japan than in Lancashire—possibly more labour as well as more operatives, because labour as well as operatives may be cheaper. On the same work the output per spindle per hour is less in Japan than in England, even when day-shifts only are taken into account.

parliamentary papers containing useful material. Printed copies of the Wages Lists' are issued by the trade unions. The Factory Acts are dealt with in Hutchins and Harrison's History, mentioned above, as well as the literature relating to them; while the handbooks by Redgrave and by Abraham and Davies are specially useful.

On the industry abroad the following are the fullest authorities:—

B. H. Chapman's Cotton Industry and Trade (1905); Amsterdam, the Cotton Industry; Hasbach's article, "Zur Charakteristik der englischen Industrie" in Schmidt's Jahrbuch, vol. II (1903); Leontie, Le Coton; Lohmuller, Zur Entwickelung der Baumwollindustrie in Deutschland (1906); Montgomery, The Cotton Manufacture of the United States of America contrasted with that of Great Britain (1840); Oppel, Die Baumwolle (1872); Schulze-Gaevernitz, Der Grossbetrieb, ein wirtschaftlicher und socialer Fortschritt; eine Studie auf dem Gebiete der Baumwollindustrie (1892); T. M. Young, The Cotton Trade in England and on the Continent;

American Cotton Industry (1902); Utley, Cotton Spinning and Manufacturing in the United States of North America (1905); a report of a tour as Gartside scholar of the university of Manchester; and the Gartside reports on the cotton industries of France and Germany by Forrester and Dehn respectively. Information will also be found in Diplomatic and Consular Reports, and fragments may be gathered from other books such as G. Drage’s Russian Affairs, Dyer’s Dai Nippon, and Huber’s Deutschland als Industriestaat. Japan has published since 1901 a very full financial and economical annual, and the British government issues annually a good statistical abstract for India. The American census contains much detailed information, and there, in addition to the statistics issued by the Federal government, those of Massachusetts, the Bureau of Statistics of which has also reported the results of an investigation into the industry in the Southern states. Among official matter the semi-official Bombay and Lancashire cotton spinning inquiry of the Manchester Chamber of Commerce may be included. The census of production of the United Kingdom must be mentioned, and the reports of the International Congresses of Cotton Spinners and Manufacturers. As to labour, see the reports of the International Textile Congresses.

The periodical literature is of good quality and much of it is filed in the Patent Office library. We may notice particularly the Cotton Factory Times; Textile Journal; Textile Manufacturer; Textile Mercury; Textile Recorder; Textile World Record (American); Der Leipziger Monatschrift für Textilindustrie; and the French Textile Journal. Shepperson’s Cotton Facts is an annual which relates chiefly, though not entirely, to raw cotton, as does also Cotton, the periodical of the Manchester Cotton Association. For technical works we may refer here to the well-known treatises of Brooks, Gartside, James, Nasmith and Walsley, and to Johannsen’s ponderous two-volumed Handbuch der Baumwollspinnerei, Rohstoffwürden und Fabrikation.

COTTON-SPINNING MACHINERY. The earliest inventors of spinning machinery (see Spinning) directed their energies chiefly to the improvement of the final stage of the operation, but no sooner were these machines put to practical use than it became apparent that success depended upon mechanically conducting the operations preliminary to spinning. Later inventors were, therefore, called upon not only to improve the inventions of their predecessors, but to devise machinery for preparing the fibres to be spun. Arkwright quickly perceived the importance of this aspect of the problem, and he devoted even more energy to it than to the invention with which his name is more intimately associated. But, given a complete series of machines for preparing and spinning, the cotton industry (see Cotton Manufacture) must have remained unprogressive without the co-operation of cotton growers, for by the then existing methods of separating cotton lint from seed it would have been impossible to provide an adequate supply of raw material. By inventing the saw gin, Eli Whitney, an American, in the year 1792, did for cotton planters what Paul, Arkwright, Crompton, Cartwright, Watt and others did for textile manufacturers, for he provided them with the means for increasing their output almost indefinitely.

Cotton-ginning is the process by which cotton seeds are separated from the adhering fibres. The most primitive machine employed in India and China for this purpose is the charka, which consists of two wooden rollers, or grindstone, a frame and revolving in contact. Seed cotton is fed into these rollers and the fibres pass forward but the seeds remain behind. It is a device which does not injure the fibres, but no improvement has been found by which the charka can be converted into a sufficiently productive machine for modern requirements. In a modified form Whitney’s saw gin is still used to clean a large portion of the annual crop of short and medium stapled cottons. It consists of from 60 to 70 saws (A, fig. 1), which are mounted upon a shaft and revolve between the interstices of an iron grid (B); against this grid the seed cotton is held whilst the fibres are drawn through, the seeds being left behind. The operation is as follows—seed cotton is fed into the hopper (C), and conveyed by a lattice (D) to a spiked roller (E), which regulates the supply to the hopper (F). Whilst in (F) the cotton is engaged by the teeth of the saws (A), and drawn through the grid (B), but the bars are too close to permit the seeds to pass. A brush (G) strips the cotton lint from the saws, after which it is drawn through a flue (H) to the surface of a perforated roller (I) by pneumatic action; it then passes between (I) and (J) out of the machine. The Macarthy gin is the only other type in extensive use; it is employed to clean both long and short stapled cottons. In this gin the fibres are drawn by a leather-covered roller (A, fig. 2) over the edge of a stationary blade (B) called a doctor, which is fixed tangential to the roller. Two cranks (E) move two other blades (C, D) up and down immediately behind, and parallel to, the fixed blade (B). The cotton is thrown into the hopper (F) and the fibres are drawn by the roller (A) until the seeds are against the edge of the doctor (B), when the beaters (C, D) strike them off, but permit the fibres to go forward with the roller. Attempts continue to be made so to improve both machines, that production may be increased,
and labour charges, and the risks of injuring the fibres, reduced.

Baling.—As cotton leaves the gin, it is in some cases rolled, under compression, into cylindrical bales; but it is usually packed into rectangular bales, that vary in weight from 160 lb to 750 lb, by steam or hydraulic presses. After pressing, the cotton is covered with coarse jute bagging, and the whole secured by iron bands. In this form it arrives at the spinning mills.

In the mill treatment of cotton it soon became an established practice to divide the work into the following operations, namely (1) Mixing the fibres into a homogeneous mass; (2) removing impurities; (3) combing out entanglements in, and ranging the fibres in parallel lines; (4) simultaneous combination and attenuation of groups of parallel fibres; (5) completing the combination and attenuation, and twisting the fibres into a thread; (6) compounding, finishing and making-up of threads. These remain the essential conditions of cotton-spinning. The principal machines used to carry out the foregoing stages are: The bale breaker, opener and scutching; the card and comber; the drawing, slubbing, intermediate and roving frames; ring and mule spinning; winding, doubling; clearing and gassing the reel, and bundling press, together with several auxiliary machines. All the operations included in this list are necessarily employed in the production of all kinds of yarn; low counts require fewer, and high counts more processes.

A bale breaker is used to disentangle fibres which have been, by hydraulic or steam presses, converted into hard masses that resist manual efforts to disentangle them. It may consist of three pairs of spiked and one pair of fluted rollers. If so, the matted cotton is fed into the first pair, seized by the second pair, which have a higher surface velocity, and pulled, while the third pair reduce the whole to a more or less fluffy mass, and the fluted rollers deliver it upon a travelling lattice by which it is conveyed to, and deposited upon, the floor of the mixing room. Instead of rollers, a hopper breaker may be used. In this machine the cotton is carried by a horizontal lattice into contact with a sloping spiked one, whose spikes tear away small tufts and deposit them upon a second lattice for removal to the mixing room. A stack of pulled cotton is formed by superposing thin layers from different bales, and when completed the cotton is drawn from top to bottom of the stack. By this means a thorough mixing of fibres is effected.

The Opener.—Mixed cotton may be thrown upon a lattice and conveyed to a spiked roller to be pulled, beaten, discharged into a trunk, and drawn by pneumatic force to the opener. Or it may be spread (fig. 3) upon a lattice (1), and carried between feed-rollers (E)
COTTON-SPINNING MACHINERY

FIG. 5.

to be subjected to the action of a beater (A) whose teeth first seize tufts of cotton and then fling them upon a grid (B), to be subsequently seized by other teeth and again flung off until dirt and other impurities pass between the grating. The beater may be cylindrical (as at A) or in the form of a truncated cone: in either event, from four to twelve rows of teeth project from its surface. It is from 18 in. to upwards of 36 in. in diameter, approximately 40 in. wide; whilst conical beaters make from 300 to 700 revolutions; while conical beaters make from 1000 to 1500 revolutions per minute. The opened cotton is carried, in the direction indicated by the arrows, upon a strong blast of air which is generated by a fan (H), and deposited in it in patches upon the surfaces of two perforated zinc or wire cylinders (C), but dust and foreign particles pass through the interstices. As these cylinders revolve towards each other the cotton passes between them in the form of a sheet to a pair of feed-rollers (D), which may again deliver it to a beater with two or three blades; if so, from this beater the cotton is next borne on an air current to, and between, a second pair of perforated cylinders. In either event, the final cages (C, C) deliver the cotton to feed-rollers (D) and they pass it to calender-rollers (F), by which it is compressed into a sheet, and finally coiled into a lap (G). Various kinds of beaters have been patented, all of which differ in some important respects; for example, a hopper feed may be substituted for the trunk or the lattice feed, in which event the cotton from the mixing room is conveyed mechanically upon lattices, and deposited in a hopper affixed to an opener. In this hopper a sloping spliced lattice elevates the cotton to an evening roller, whose office is to sweep back the surplus supply from the splices, but allow the requisite quantity to pass forward to the beater. A regular supply of cotton to an opener is of great importance, and in order to insure it a table is often formed by substituting for the lower roller (E) a series of levers (A, fig. 4) all mounted upon a fulcrum (B), and having their free arms weighted by wedge-shaped pendents (C), that are separated by bowls (D). A fluted feed-roller (E) is fixed above this table and the cotton is led over the lever but beneath the roller. If the cotton is unequally distributed, thick places will press down the levers and thin ones will permit them to rise (as at A', E'). The rise of one pendent may be cancelled by the fall of another, but any balance of their movements is transmitted to a belt fork which governs a belt running upon a pair of inverted cones, and by this means the belt is traversed to and fro to drive the feed-roller (E) at a superior speed when the supply of cotton is insufficient, and at an inferior speed when the supply is excessive.

The Scutch.—In many respects a scutter resembles an opener; its function is to continue the cleaning and form laps of uniform weight and density for the carding engine. Occasionally the scutter is the first cleaning machine, in which event cotton, in a loose fleecy, is spread evenly upon a lattice. In order to carry the combination of fibres one stage further, three or four opener laps are generally placed upon the feeder, so that, as the laps unroll, three or four series of cotton will be superposed, and in this form are passed by the lattice (F, fig. 4) and the feed-roller (E) to either one or two beaters, which are furnished with two or three blades. The beater (G) flings the cotton against the bars of grid (H) to loosen, and cause the dirt to pass between the bars, after which the cotton is carried forward upon an air current, in the same manner as in an opener, and formed into a lap. In case two scutters are required, the laps from the first are led into the second, where they are similarly treated; in both machines the lever and pendent mechanism furnishes the means by which uniformity is attained. A beater may consist of a straight, smooth blade (as at G), or of a blade provided with stout teeth; in the latter event the operation resembles combing rather than beating. Two-bladed beaters revolve from 1200 to 1500 times per minute; those with three blades from 900 to 1000 times per minute.

Carding Engine.—The functions of a card (see Carding) are to place the fibres parallel, to remove remaining impurities and immature fibres, and to form mature fibres into a porous band, called a sliver. A carding engine consists of three cylinders which are covered with cards; the first, or taker-in (see fig. 5), is the smallest; the second and largest is the main cylinder; and the third is the doffer. If the main cylinder is surrounded by a series of small ones (as at A), the engine is called a roller and clearer card. If a series of fixed strips of card are placed above the main cylinder, the engine is known as a stationary flat card. But if the strips move forward (as at B) it is a revolving flat card. In a roller and clearer card the smaller cylinders (E) are also covered with cards, but their teeth are bent to oppose those on the main cylinder, and they revolve with a different velocity. The taker-in is covered with saw teeth cut in a strip of steel which is fixed in the surface of that cylinder it receives the cotton (I) from a feed-roller (C) that turns above a smooth iron table (D) called the feed plate, and strikes out the heaviest particles of remaining dirt. In passing through the fringe of lap, the teeth comb the attached fibres but deliver the loose ones to the main cylinder. The latter carries them into contact with the teeth on the rollers (E), by whose lower surface velocity combing is again effected. Short fibres become fixed amongst the teeth of (A) and (E), but those lying crosswise are transferred from (A) to (E) and from (E) to the clearer, which again present them to the cylinder.

When long fibres are turned to point in the direction of rotation they advance upon the cylinder A to the doffer teeth, where the
scattered fibres on the surface of A are collected into a light fleece.
In this condition they are stripped by a vibrating comb (F), drawn together by a funnel, formed into a sliver, and deposited in a can (G).
This machine is now chiefly used to card waste and low-class cotton.
If such a card is made with two main cylinders, a combing cylinder called a tumbler collects the fibres from the first and passes them on to a second main cylinder, where they are again treated as already described.
In a stationary flat card the teeth in the flats are bent to oppose those on the main cylinder, and by this means the fibres are set straightened.
In the revolving flat card the flats (H) are formed into an endless chain, and they travel slowly in the same direction as the cylinder. In other respects both flat cards are similar to a comber and roller card.
Formerly double carding, namely, two passages through the same card, or one passage through a double card, was general, but single carding is now employed for most purposes.
Combing.—For counts from 60 up, and for exceptionally good yarns of lower counts, from 14 to 20 cans from the carding engine are taken to a slitter machine, where the slivers are drawn alongside each other, passed between three pairs of drawing rollers and two pairs of calender rollers, and formed into slivers that vary in width from 7 to 12 in. This machine is provided with mechanical devices for stopping it on the failure of a sliver and on completion of a predetermined length of sliver.
When the sliver lap machine furnishes laps for the comber, the slivers are previously passed through a head of drawing, namely, between four lines of drawing rollers, to straighten out the fibres. The more general practice is to pass sliver laps to a ribbon lap machine, at the back of which six laps are placed, and facing one end, in one long line and simultaneously unrolled to feed each web between four pairs of drawing rollers. From the rollers the comb passes in separate films over curved plates to a smooth table where one is superseded upon another, and in the combined state it is led between two rows of calender rollers and formed into a lap from 7 to 10½ in. wide.
In the cotton industry the Heilmann combing, or some modification of that method, has been applied to make the fibres of carded cotton, to cast out below a certain length, and leave only those that are perfectly clean and approximate to uniformity in length. Fine yarns of medium quality only part of the slivers required to form a thread are combed. But for yarns of good quality all the fibres are combed, and these for superfine yarns are twice, or "double combed." This machine is made with six or eight heads, each of which is supplied with a ribbon lap. One end of every lap is fed by a pair of rollers between the open jaws of a nipper which imparts a considerable twist upon the sheet of cotton, but a fringe is left protruding into the path of a cylinder, on whose periphery either one set of 17, or two sets of 13, graduated needle combs, and one, or two, fluted segments are secured. The first comb to reach the cotton must pass through a cylinder which was operative when the cylinder combs were acting, has descended into the fringe, and three rollers first return a portion of the material already combed so that it may overlap that last treated. The rollers then reverse the direction of movement; one from them, and the segment engage the fringe, and draw the tail ends of all free fibres through the teeth of the top comb. The product of all the heads is next united, condensed, formed into a continuous sliver, and deposited in a can. One cycle of operations, therefore, only combs from 5 to 6 of an inch of each fibre; the top comb is withdrawn after each operation, and the major portion of the work is done by the cylinder combs. The combined operations are repeated at the rate of from 85 to 90 times per minute, during which from 15 to 25 per cent. of carded material are removed, the more of being spun into coarse yarns. A comber invented by John W. Nasmith is a modification of the foregoing. In his machine the cylinder combs act upon the forward ends of the fibres whilst under the control of the nipper, after which the fibres are combed the sufficient portion of the previously combed film to overlap, and to enable the front rollers to engage the fringe. The rollers then draw a part of the fringe through the teeth of the top comb, which, as a sequence, treats all the forward ends of the fibres. Since one passage through the cylinder and top combs completes the operation for one set of fibres, this machine gives a higher production; it also gives a wider range of adaptability, and a lower percentage of waste than the Heilmann machine.

**COTTON-SPINNING MACHINERY**

The Drawing Frame.—For fine counts the slivers from the comber, and for low or medium counts those from the card, are passed to the drawing frame, because in both conditions the material is irregularly distributed throughout the several slivers, and it is the function of the drawing frame to eliminate all such irregularities by drawing several slivers down to the dimensions of one, for here the processes of combination and attenuation are carried further than in any other machine. A drawing frame consists of three or four heads, each of an equal number of drawing rollers (A, B, fig. 6). The roller (B) are fluted longitudinally and the other ones (A) are covered with rubber, and weighted as at (H) to give the two proper hold of the cotton. Each head contains several deliveries. Six or eight slivers (C) are put up to each delivery and drawn down into one by causing successive layers of lines of rollers (A, B) to move at an accelerated speed; the front one revolving about six or eight times faster than the back one. On leaving the front roller the sliver is conducted to a trumpet-shaped tube (D), thence between a pair of calender rollers (E), and, finally, through a diagonal passage in a plate (F);

the latter coils the sliver into a rotating can (G). Back and front devices are provided to arrest motion in this machine when a sliver fails. At the back, each sliver passes over and depresses a separate spoon-sharped lever (I), thereby lifting the hooked lower end of (I) and preventing it from being spun into coarse yarns. The machine continues in motion, but when a sliver fails, the lever (K) causes the driving gear to stop the machine. Six or eight cans containing once drawn slivers are put up to the head of the second draw, and similarly drawn, and finally, a similar number of these drawn slivers are fed into the third head again and again, giving in all 6×6×6=216 doublings; or 8×8×8×8=512 doublings. Occasionally four heads of drawings are used and eight slivers drawn into one, which gives 8×8×8×8=4096 doublings; hence, irregularities in an original sliver have been minimized by successive combination and attenuation.

**Flyer Frames.**—Cotton in cans, from the final head of drawing, is transferred to the bobbin frame, by which it is attenuated, slightly twisted, and wound upon spools. Each sliver is drawn out by means of three pairs of rollers, and as it emerges from the front pair, a flyer (A, fig. 7), which revolves uniformly upon a spindle (B), carries the sliver (C) round with it to twist the fibres axially. This flyer coils the twisted material upon a wooden tube (D) in close-wound spirals and in successive layers. The tube is loosely mounted upon
COTTON-SPINNING MACHINERY

but driven independently of, the spindle, in order that as the tube increases in diameter the number of revolutions it makes may be reduced to suit the constant delivery of the roving. This is effected by a differential motion which usually consists of a large wheel, within which two other wheels are made, one fixed with a regular motion, but the large wheel is driven from a pair of cone drums at a decreasing speed.

The intermediate frame comes between the slubbing and roving frames and is of similar construction to the slubber, but has a larger number of spindles and smaller tubes.

Instead of having cans put at the back, the slubbing tubes are mounted vertically in a creel, passed in pairs through the eyes of the flyers, and drawn down to a smaller diameter than that of the slubbing. In this machine, therefore, the fourfold process of combination, detwisting, twisting, and winding are effected consecutively and continuously.

The roving frame is also in principle used in slubber and intermediate machines, but it contains a greater number of spindles, and the tubes are smaller than it. Each roving machine is similarly treated in the second in order to render the final product sufficiently fine for spinning year of the required barrel.

Spinning (see SPINNING).—Improvements upon the Saxony wheel caused continuous spinning to become practicable at an earlier date than intermittent spinning. Arkwright’s water-twist frame was gradually changed to the thrroale, which was used to have their hands when at first from the best Egyptian and Sea Islands cottons, a second roving, or Jack frame may be required, in which case the course of roving is through the former draws and twist by fly to a flyer. When the tubes are connected so that one revolving gear would serve for the whole length, and all the spindles were driven by bands from a central cylinder. The roving spools were placed vertically in a creel between the two sets of rollers, and the rovings reduced to the final tubes, after which each was passed through a coiled eye at the lower end of a flyer leg, and attached to a double-flanged spool which was loosely mounted upon a spindle. At each revolution of a flyer a twist was put in the tubes, the tubes were then wound around the spools, and the spools then wrapped as much thread upon a spool as the rollers delivered. The spools rested upon a piece of woolen cloth stretched over a rail, and this rail rose and fell through a space equal to the length of the thread. The line of spools, wrapped with thread round the top of a stationary spindle, and upon the spindle a freely fitting sleeve and whare; the former to receive a spool, the latter to rotate both. By a reverse motion all the spools were simultaneously raised or depressed by some means, on the twining point, entirely within the cup, and when at the lowest entirely below it. A thread passed from the drawing rollers, outside the cup, to a spool. As a spool rotated its thread was uniformly twisted, the lower edge of the cup was brought into contact with the spool barrel, and the requisite drag resulted from friction set up by the thread rubbing against the surface of the cup. The thrroale has almost disappeared from the cotton industry, and Danforth’s frame entirely so, but the latter is still used to spin worsted.

Ring spinning is practically the only system of continuous spinning used in the cotton industry; it was first patented in the United States of America by J. Thorne, in 1828, and in that country was extensively used long before it became established in England. Its chief feature consists in the substitution for the flyer, or the cup, of a smooth annular ring (A, fig. 8) formed with a flange at the upper edge, upon which a light C-shaped piece of wire (B), called a traveller, is sprung. The rings are secured in a rail (C) that rises out of any and falls slowly, but at each succeeding ascent and descent it attains a higher point than that previously reached. A spindle (D) is supported by, and turns in a bolster secured to a fixed rail (E). If the bolster only provides a bearing for the centre of the spindle, and so leaves the foot free to find its own position of steadiness, it is known as a self-battening or gravity spindle. A recess in the bolster is filled with oil to automatically lubricate the bearing. A spindle is placed in the centre of each ring; it has a sleeve fitted upon it which carries a whare (F) that covers the upper part of the bolster, and a band from a pair of drums is drawn round the whare to drive the spindle. So perfect is the construction of these spindles that they can be run without appreciable vibration at speeds beyond the ability of operatives to attend them; although a speed of 11,000 revolutions per minute is a practicable one.

After passing the drawing rollers (G), the roving (H) is twisted, hooked into the traveller (B), and made fast to a spool (I) placed upon the spindle. As spinning proceeds the traveller is pulled round the ring by the thread; it thus rises upon, and holds the thread at the winding point. In all continuous spinning the number of twist inserted into a given length of thread is governed by the surface speed of the front roller, relatively to the revolutions of the flyer, or to the speed of the winding surface.

Intermittent Spinning.—The essential difference between continuous spinning and ring spinning is that the former draws and twist consecutively, whilst the latter draws and twist simultaneously. In the mule, a creel (A, fig. 9), fixed at the back of the machine, is designed to hold the roving (B) in three or four tiers, from whence it is fed to the drawing roller (C) and then to the faller (D). The faller (D) is next led to spindles (E) mounted in a carriage (F) whose wheels run upon rails (G) called slips. As the rollers (C) feed the partially attenuated rovings the carriage recedes from the machine a little faster than the rovings are delivered, thus completing the attenuation. Meanwhile, the spindles are revolved rapidly by bands passing from a tinned cylinder (H) and the threads are twisted. This twist goes first to the thin places where least resistance is offered to it, leaving thick places almost untwisted; the pull of the carriage, and in 1792 causes the fibres to slip most readily where there are fewest twist, and gives to a thread an approximation to uniformity in diameter. For fine yarns the rollers cease to rotate slightly before the carriage has attained the end of its outward run, or stretch, and the twist is therefore attained by the tension of the threads. On the termination of a stretch the carriage stops, the twisting is completed, the spindles reverse the direction of their rotation to back off, or remove the yarn which is coils round the faller (D). The faller (D) is then reeled off the carriage, and whilst one faller wire is operating on all the spindles at once, descends to the winding point of each spindle, the other rises to take up the yarn delivered by the spindles. This completed, the carriage returns to the roller beam, the faller wire is again attached, and the carriage proceeds, the distance of 48 to 66 in. of yarn spun in the outward journey. All the foregoing movements are regulated to succeed each other in their proper order, the termination of one operation being the initiation of the other.

Crompton’s original machine was controlled manually throughout, but later he devised means for moving the carriage out mechanically, for stopping the rollers at the proper time, and for locking the carriage. Meanwhile the spindles added the final twist to the threads. After which all parts became stationary and the manual operations commenced. These consisted in backing off, operating the faller wire, rotating the spindles and pushing the carriage home. In this year 1785 the steam-engine was employed for cotton spinning, and in 1792 William Kelly placed the headstock of a mule, in which the chief mechanism is situated, in the middle of the carriage, instead of at one end. By this device one machine was doubled in length, and shortly afterwards two miles, each of 300 to 400 spindles, were allotted to one spinner and his assistants. Kelly also attempted to control all parts of the machine mechanically, but in
COTTON-SPINNING MACHINERY

Fig. 9.

For many purposes the threads as spun by the ring frame or the mule are ready for the manufacturer; but where extra strength or smoothness is required, as in threads for sewing, crocheting, hosiery, lace and carpets; also where multicoloured effects are needed, as in Gadrille, or some special form of irregularity, as in corkscrewed, and knopped yarns, two or more single threads are compounded and twisted together. This operation is known as doubling. In order to prepare threads for doubling it may be necessary to wind side by side upon a flanged bobbin, or upon a straight or a tapering spool, from two to six threads before twisting them into one.

Winding machines for this purpose are of various kinds. There are those in which the threads are laid evenly between the flanges of a bobbin, and those that coil the threads upon a strand behind tapetgage. In the latter the tubes may be laid upon diagonally split drums and rotated by frictional contact. By placing each group of threads to be wound in the slit of a rotating drum, it is drawn quickly to and fro and coiled upon a spool. If solid instead of split drums be used, the guides for all the threads on one side of a machine are attached to a bar, which is traversed by a cam placed at one end of the frame. Or independent mechanism may be provided throughout for treating each group of threads to be wound. The bobbins or tubes may be filled from cops, ring spools or hanks, but a stop motion is required for each thread, which will come into operation immediately a fracture occurs.

Doublers.—In action doublers are continuous and intermittent. The former resemble throttle and ring spinning machines, but since they do not attenuate the material, only one line of rollers is provided. The folded material is placed in a creel and led through the rollers to the spindles to be twisted in a wet or dry condition. If wet, the material flattens down most of the protruding ends of the fibres and produces a comparatively smooth thread; if dry, the doubled yarn retains some of its furry character. There are two types of continuous doublers, which are known respectively as English and Scotch. By the English system of dry doubling the yarn from the creel may be treated, on its way to the spindle, in various ways to obtain the desired tension. It may be led under a rod, over a guide, round and between the rollers, and round a glass peg. For wet doubling, a trough containing water is placed behind the rollers, and the yarn passes beneath a glass rod in the water, thence over a guide, beneath, between and over the rollers to the spindles. By the Scotch system the trough is placed below the rollers, and the bottom roller is partly immersed in water. It is claimed that this system wets the fibres more thoroughly than the English one. For the purpose of twisting the strands together the spindles may be provided either with flys, as in throstle spinning, or with rings and travellers, as in ring spinning. The twist is generally in the opposite direction to that in the single threads. When more than three strands are required in a compound thread it is customary to pass the material more than once through the doubler, as, for example, in a sixfold thread, two strands may be twisted together in the same or in the opposite direction to the spinning twist; after which the once-doubled thread is "cleared," folded, and three strands of twofold yarn are twisted in the opposite direction to that employed in the first operation. In some machines doubling proceed simultaneously, and some are furnished with an automatic stop motion. But when twisting two threads together to oppose the spinning twist, the failure of one causes the other to untwist and break, therefore, under such circumstances a stop motion is unnecessary.

Intermittent doublers are known as twinders, and these are of two kinds, namely, English and French. In the former the spindles are fitted in a stationary rail, but the creel, containing the cops or ring spools, is mounted upon a carriage and moves in and out, as in Hargreaves' spinning Jenny (see SPINNING). French twinders have a stationary creel, and the spindles move in and out with the carriage, as in the spinning mule. The material to be formed is often subjected to the action of steam in order to render it less elastic, after which it is mounted upon skewers in the creel, and two or three threads are passed to each spindle to be twisted together and formed into a cop. Between the creel and the spindles all the strands are kept equally by drawing them over flannel-covered boards and under porcelain weights. For wet doubling, the strands pass through a trough containing water, and the flannel surfaces are also wet.

Clearing.—After the first, or the final, doubling it is often necessary to remove lumps, imperfect knots and loose fibres from a thread. This is accomplished by passing each through a slit, or clearer, whose width is adjusted to the diameter of the thread to be treated. By this means anything which gives a thread abnormal bulk will be prevented from passing the slit. Once through the slit a thread is coiled upon a friction-driven, double or single-headed bobbin. If the former, the coils are evenly laid; if the latter, they are disposed into a bottle shape. Or, again, cheeses may be wound.

Gassing.—In cases where a thread with a smooth surface is required the extending ends of fibres must be burned off. Thus: each thread from a creel is drawn over a tension rod to two freely mounted pulleys, having parallel grooves cut in their surfaces and axes in the same horizontal plane. After bending a thread forward and backward in the grooves of both pulleys, it passes through a Bunsen flame and is coiled upon a tube, which is held against the face of a rotating drum, while a vibrating guide distributes the thread across the tube. The gas-burner is situated midway between the grooved pulleys, and so mounted beneath the thread that it will automatically swivel sideways and thus move the flame away from a stationary thread. Winding begins slightly before the flame moves beneath a thread, and the rapid motion of the latter permits the flame to burn off undesirable matters without injuring the thread.

Reeling.—Doubled or gassed yarn may be wound upon warpers' bobbins and made into warps for the loom, or it may be reeled into
hanks for the preparing and finishing processes. But a reel hanks yarns for bleaching, dyeing, printing, polishing and bundling, and is adapted for cops, ring spools, doubling bobbins or cheeses. From cops, ring spools and cheeses the yarn is usually drawn over one end, but flanged bobbins are mounted upon spindles and the yarn drawn through or over them. A reel has a circumference of 54", and after making 80 or 360 revolutions it automatically stops; the first gives a lea of 120 yds, and the last a hand of 840 yds. For grant reel, however, a hank may be from 5000 to 10,000 yds. long. Reeling is of two kinds: on reel and on prudent. In the former method there are seven of these united in one hank by a lease band which retains the divisions. In cross-reeling a thread is traversed over a portion of the reel surface by a reciprocating guide to form a hank without divisions. On the completion of a set of hanks the reel is made to collapse and thus facilitate the removal of the yarn.

**Bundling Press.**—Hanks are made into short or long bundles, each of 500 or 750 lb. In store bundles it is usual to use groups of ten hanks, and these are twisted together, folded and compressed into bundles; but in long bundles the hanks are compressed without being folded. A press consists of a strong table upon which a box, with vertical bands, is formed. The bottom of this box is grooved transversely and made to rise and fall by wheel bearing or by eccentrics. The sides and top are made of vertical and horizontal bars, set to coincide with the grooves in the bottom. To one set of vertical bars a similar number of horizontal pieces are hinged. A movable plate, held in a fixed position by which hold the horizontal bars in position. When the hinged bars are turned up, strings are drawn through the grooves, and the bottom is covered with stout paper. The hanks are then laid in the box, another paper is placed above, and in this manner the whole is compressed. When the bottom then rises a predetermined distance, and automatically stops. While in this position the strings are tied, the bottom of the press next descends, and the bundle is removed. (T. W. F.)

**COTYS, a name common to several kings of Thrace. The most important of them, a cruel and drunken tyrant, who began to reign in 382 B.C., was involved with the Athenians in a dispute for the possession of the Thracian Chersonese. In this he was assisted by the Athenian Iphicrates, to whom he had given his daughter in marriage. On the revolt of Ariobarzanes from Persia, Cotys opposed him and his ally, the Athenians, in 338 he was murdered by the sons of a man whom he had wronged.**

Suidas, Eupoliuus Nepos, Iphicrates, Timotheus; Xenophon, Agesilaus; Demosthenes, Contra Aristocratam; Theopompos in Muller, Frag- mena Historicae Graecorum, i.

**COUCH, DARIUS NASH (1822–1897), American soldier, was born at South East, Putnam county, N.Y., on the 23rd of July 1822, and graduated from West Point in 1846, serving in the Mexican war and in the war against the Seminole Indians. He left the army in 1855, but soon after the outbreak of the civil war he was made a brigadier-general U.S.V. He served as a divisional commander in the battles of the Army of the Potomac in 1862, and at Fredericksburg (December 1862) and Chancellorville (May 1863) he commanded the II. corps. He had been made a major-general U.S.V. in July 1862. During the Gettysburg campaign he was employed in organizing the Pennsylvanian militia, and he subsequently served in the West, taking part in the battle of Nashville, and in the final operations in the Carolinas. He left the army after the war. General Couch died on the 14th of February 1897 at Norwalk, Connecticut.

**COUCY, LE CHATELAIN DE,** French troubére of the 12th century. He is probably the Guy de Couci who was castellan of the castle of that name from 1156 to 1162. Some twenty-six songs are attributed to him, and about fifteen or sixteen are undoubtedly authentic. They are modelled very closely on Provençal originals, but are saved from the category of mere imitations by a grace and simplicity peculiar to the author. The legend of the love of the Châtelain de Coucy and the Lady of Fayel, in which there figures a jealous husband who makes his wife eat the heart of her lover, has no historical basis, and dates from a late 13th century romance by Jakemon Sakeas. It is worth noting that the story, which seems to be Breton in origin, has been also told of a Provençal troubadour, Guilhem de Cabez-taing, and of the minnesinger Reinmar von Brennenburg. Pierre de Belloy, who wrote some account of the family of Couci, made the story the subject of his tragedy Gabrielle de Vergy.

**COUCY-LE-CHATEAU,** a village of northern France, in the department of Aisne, 18 m. W.S.W. of Laon on a branch of the Northern railway. Pop. (1896) 663. It has extensive remains of fortifications of the 13th century, the most remarkable feature of which is the Porte de Laon, a gateway flanked by massive towers and surmounted by a fine apartment. Coucy also has a church of the 13th century, preserving a façade in the Romanesque style. The importance of the place is due, however, to the magnificent ruins of a feudal fortress (see CASTLE) crowning the eminence on the slope of which the village is built. The remains, which encircle an area of more than 10,000 yds. form an irregular quadrilateral built round a court-yard and flanked by four huge towers. The nucleus of the stronghold is a donjon over 200 ft. high and over 100 ft. in diameter, standing on the south side of the court. Three large vaulted apartments, one above the other, occupy its interior. The court-yard was surrounded on the ground-floor by storehouses, kitches, &c., above which on the west and north sides were the great halls known as the Salle des preux et the Salle des preuses. A chapel projected from the west wing. The bailey or base-court containing other buildings and covering three times the area of the château extended between it and the village. The architectural unity of the fortress is due to the rapidity of its construction, which took place between 1230 and 1242, under Enguerrand III., lord of Coucy. A large part of the buildings was restored or enlarged at the end of the 14th century by Louis d'Orléans, brother of Charles VI., by whom it had been purchased. The place was dismantled in 1652 by order of Cardinal Mazarin. It is now state property. In 1856 researches were carried on upon the spot by Violette-Duc, and measures for the preservation of the ruins were subsequently undertaken.

Sir John Coucy, second son of the baron's wife, gave its name to the sires de Coucy, a feudal house famous in the history of France. The founder of the family was Enguerrand de Boves, a warlike lord, who, at the end of the 11th century seized the castle of Coucy by force. Towards the close of his life, he had to fight against his own son, Thomas de Marle, who in 1115 succeeded him, subsequently becoming notorious for his deeds of violence in the struggles between the communes of Laon and Amiens. He was subdued by King Louis VI. in 1117, but his son Enguerrand II. continued the struggle against the king. Enguerrand III., the Great, fought at Bouvines under Philip Augustus (1214), but later he was accused of aiming at the crown of France, and he took part in the disturbances which arose during the regency of Blanche of Castile. These early lords of Coucy remained till the 14th century in possession of the land from which they took their name. Enguerrand IV., sire de Coucy, died in 1320 without issue and was succeeded by his nephew Enguerrand, son of Arnold, count of Guines, and Alix de Coucy, from whom is descended the second line of the house of Coucy. Enguerrand VI. had his lands ravaged by the English in 1339 and died at Crécy in 1346. Enguerrand VII., sire de Coucy, count of Soissons and Maine, and chief bucher of France, was sent as a hostage to England, where he married Isabel, the eldest daughter of King Edward III. wishing to remain neutral in the struggle between England and France, he went to fight in Italy. Having made claims upon the domains of the house of Austria, from which he was descended through his mother, he was defeated in battle (1375-1376). He was entrusted with various diplomatic negotiations, and took part in the crusade of Hungary against the Sultan Bayazid, during which he was taken prisoner, and died shortly after the battle of Nicopolis (1397). His daughter Marie sold the fief of Coucy to Louis, duke of Orleans, in 1400. The Châtelain de Coucy (see above) did not belong to the house of the lords of Coucy, but was castellan of the castle of that name.
COUES—COUMARIN

COUES, ELLIOTT (1842-1890), American naturalist, was born at Portsmouth, New Hampshire, on the 9th of September 1842. He graduated at Columbian (now George Washington) University, Washington, D.C., in 1861, and at the Medical school of that institution in 1863. He served as a medical cadet in Washington in 1862-1863, and in 1864 was appointed assistant-surgeon in the regular army. In 1872 he published his Key to North American Birds, which, revised and rewritten in 1884 and 1901, has done much to promote the systematic study of ornithology in America. In 1873-1876 Coues was attached as surgeon and naturalist to the United States Northern Boundary Commission, and in 1876-1880 was secretary and naturalist to the United States Geological and Geographical Survey of the Territories, the publications of which he edited. He was lecturer on anatomy in the medical school of the Columbian University in 1877-1882, and professor of anatomy there in 1882-1887. He resigned from the army in 1881 to devote himself entirely to scientific research. He was a founder of the American Ornithologists’ Union, and edited its organ, The Auk, and several other ornithological periodicals. He died at Baltimore, Maryland, on the 25th of December 1890.

In addition to ornithology he did valuable work in mammalogy; his book Fur-Bearing Animals (1877) being distinguished by the accuracy and completeness of its description of species, several of which are already becoming rare. In 1887 he became president of the Esoteric Theosophical Society of America. Among the most important of his publications in connection with his work and collaboration was A Field Ornithology (1874); Birds of the North-west (1874); Monographs on North American Rodentia, with J. A. Allen (1877); Birds of the Colorado Valley (1878); A Bibliography of Ornithology (1878-1880, incomplete); New England Bird Life (1881); A Dictionary and Check List of North American Birds (1882); Biogen, A Speculation on the Origin and Motive of Life (1884); The Daemon of Darwin (1884); Can Matter Think? (1886); and Neuro-Myology (1887). He also contributed numerous articles to the Century Dictionary, wrote for various encyclopaedias, and edited the Journals of Lewis and Clark (1803), and The Travels of Zebulon M. Pike (1805).

COULLISE (French for “groove,” from couler, to slide), a term for a groove in which a gate of a sluice, or the side-scenes in a theatre, slide up and down, hence applied to the space on the stage between the wings, and generally to that part of the theatre “behind the scenes” and out of view of the public. It is also a term of the Paris Bourse, derived from a coulisse, or passage in which transactions were carried on without the authorized agents de change. The name coulissier was thus given to unauthorized agents de change, or “outside brokers” who, after many attempts at suppression, were finally given a recognized status. They bring business to the agents de change, and act as intermediaries between them and other parties. (See Stock Exchange: Paris.)

COULOMB, CHARLES AUGUSTIN (1736-1806), French natural philosopher, was born at Angoulême on the 14th of June 1736. He chose the profession of military engineer, spent three years, to the decided injury of his health, at Fort Bourbon, Martinique, and was employed on his return at Rochelle, the Isle of Aix and Cherbourg. In 1781 he was stationed permanently at Paris, but on the outbreak of the Revolution in 1789 he resigned his appointment as intendant des eaux et fontaines, and retired to a small estate which he possessed at Blois. He was recalled to Paris for a time in order to take part in the new determination of weights and measures, which had been decreed by the Revolutionary government. Of the National Institute he was one of the first members; and he was appointed inspector of public instruction in 1802. But his health was already very feeble, and four years later he died at Paris on the 23rd of August 1806. Coulomb is distinguished in the history alike of mechanics and of electricity and magnetism. In 1779 he published an important investigation of the laws of friction (Théorie des machines simples, en ayant regard au frétement de leurs parties et à la roideur des cordages), which was followed twenty years later by a memoir on fluid resistance. In 1785 appeared his Recherches théoriques et expérimentales sur la force de torsion et sur l’élasticité des fils de métal, &c. This memoir contained a description of different forms of his torsion balance, an instrument used by him with great success for the experimental investigation of the distribution of electricity on surfaces and of the laws of electrical and magnetic action, of the mathematical theory of which he may also be regarded as the founder. The practical unit of quantity of electricity, the coulomb, is named after him.

COULLOMMERS, a town of northern France, capital of an arrondissement in the department of Seine-et-Marne, 45 m. E. of Paris by rail. Pop. (1906) 5217. It is situated in the fertile district of Brie, in a valley watered by the Grand-Morin. The church of St Denis (13th and 16th centuries), and the ruins of a castle built by Catherine of Gonzaga, duchess of Longueville, in the early 17th century, are of little importance. There is a statue to Commandant Beaurepaire, who, in 1702, killed himself rather than surrender Verdun to the Prussians. Coulommiers is the seat of a subjeprefect, and has a tribunal of first instance and a communal college. Printing is the chief industry, tanning, flour-milling and sugar-making being also carried on. Trade is in agricultural products, and especially in cheeses named after the town.

COUMARIN, C₉H₈O₂, a substance which occurs naturally in sweet woodruff (Asperula odorata), in the tonka bean, and in yellow melilot (Melilotus officinalis). It can be obtained from the tonka bean by extraction with alcohol. It is prepared artificially by heating aceto-ortho-coumaric acid (which is formed from sodium salicylaldeyde) or from the action of acetic anhydride and sodium acetate on salicylaldehyde (Sir W. H. Perkin, Berichte, 1875, 8, p. 1599). It can also be prepared by heating a mixture of phenol and malic acid with sulphuric acid, or by passing bromine vapour at 105° C. over the anhydride of mellitic acid. It forms rhombic crystals (from ether) melting at 67° C. and boiling at 290° C., which are readily soluble in alcohol, and moderately soluble in hot water. It is applied in perfumery for the preparation of the Asperula essence. On boiling with concentrated caustic potash it yields the potassium salt of coumaric acid, whilst when fused with potash it is completely decomposed into salicylic and acetic acids. Sodium amalgam reduces it, in aqueous solution, to mellitic acid. It forms addition products with bromine and hydrobromic acid. By the action of phosphorus pentasulphide it is converted into thiocoumarin, which melts at 105° C.; and in alcoholic solution, on the addition of hydroxylamine hydrochloride and soda, it yields coumarin oxime.

Ortho-coumaric acid (o-oxycinnamic acid) is obtained from coumarin as shown above, or by boiling coumarin for some time with sodium ethylate. It melts at 208° C. and is easily soluble in hot water and in alcohol. It cannot be converted into coumarin by heating alone, but it is readily transformed on heating with acetic anhydride or acetyl chloride. By the action of sodium amalgam it is readily converted into mellitic acid, which melts at 81° C., and on distillation furnishes its lactone, hydrocoumarin, melting at 25° C. For the relations of coumaric and coumaric acid see Annalen, 254, p. 181. The homologues of coumarin may be obtained by the action of sulphuric acid on phenol and the higher fatty acids (propionic, butyric and isovaleric anhydrides), substitution taking place at the carbon atom in the α position to the CO-group, whilst by the condensation of acetoacetic ester and phenols with sulphuric acid the β substituted coumarins are obtained.

Umbelliferone or 4-oxycoumarin, occurs in the bark of Daphne mezereum and may be obtained by distilling such resins as galbanum or asafetida. It may be synthesized from resorcin and malic anhydride or from β resorcylic aldehyde, acetic anhydride and sodium acetate. Daphnein and Ascasuilen are dioxyycoumarins.

The structural formula of coumarin and the related substances are:
COUMARONES or Benzofururanes, organic compounds containing the ring system \( \text{C}_6\text{H}_4 \subset \text{CH} \supset \text{O} \text{CH} \). This ring system may be synthesized in many different ways, the chief methods employed being as follows: by the action of hot alcoholic potash on \( \alpha \)-bromocoumarin (R. Fittig, Ann., 1883, 216, p. 162),

\[
\text{CH}_3 < \text{C-Br} \rightarrow \text{CH}_3 < \text{O} \supset \text{C-CO-} \supset \text{O} \text{CH} >
\]

from sodium salts of phenols and \( \alpha \)-chloroacetoacetic ester (A. Hantsch, Ber., 1886, 19, p. 1292),

\[
\text{CH}_3 < \text{O} \supset \text{CH} \supset \text{O} \supset \text{C-COOR} ;
\]
or from ortho-xylaldheyde by condensation with ketones (S. Kostaneki and J. Tambor, Ber., 1896, 29, p. 357), or with chloracetic acid (A. Rossing, Ber., 1884, 17, p. 5000),

\[
\text{CH} < \text{O} \supset \text{CH} \supset \text{CH} \supset \text{CHO} \rightarrow \text{CH} < \text{O} \supset \text{C-COOH} >
\]

It is a colourless liquid which boils at 171-172° C. and is readily volatile in steam, but is insoluble in water and in potash solution. Concentrated acids convert it into a resin. When heated with sodium and absolute alcohol, it is converted into hydrocoumarone, \( \text{C}_6\text{H}_4 \supset \text{OH} \), and ethyl phenol.

COUNCIL (Lat. concilium, from cum, together, and the root kal, to call), the general word for a convocation, meeting, assembly. The Latin word was frequently confused with consistium (from consulere, to deliberate, cf. consult), advice, i.e. counsel, and thus specifically an advisory assembly. Du Cange (Gloss. Med. Infm. Latin.) quotes the Greek words συνέδριον, συνεδρία, συνδήσμος as the equivalent of concilium. In French the distinction between conseil (from consistium), advice, and concil, council (i.e. ecclesiastical—its only meaning) has survived, but the two English derivatives are much confused. In the New Testament, “council” is the rendering of the Hebrew Sanhedrin, Gr. συνεδρίαν. The word is generally used in English for all kinds of congregations or convocations assembled for administrative and deliberative purposes.1

The present article is confined to a history of the development of the ecclesiastical council, summoned to adjust matters in dispute with the civil authority or for the settlement of doctrinal and other internal disputes. For details see under separate headings, Nicaea, &c.

From a very early period in the history of the Church, councils or synods have been held to decide on matters of doctrine and discipline. They may be traced back to the second half of the 2nd century A.D., when sundry churches in Asia Minor held consultations about the rise of Montanism. Their precise origin is disputed. The common Roman Catholic view is that they are apostolic though not prescribed by divine law, and the apostolic precedent usually cited is the “council” of Jerusalem (Acts xv.; Galatians ii.). Waiving the consideration of vital critical questions and accepting Acts xv. at its face value, the assembly at Jerusalem would scarcely seem to have been a council in the technical sense of the word; it was in essence a meeting of the Jerusalem church which delegates from Antioch were heard but apparently had no vote, the decision resting solely with the mother church. R. Sohm argues that synods grew from the custom of certain local churches which, when confronted with a serious problem of their own, augmented their numbers by receiving delegates from the churches of the neighbourhood. Hauck, however, holds that these augmented church meetings, which dealt with the affairs of but a single church, are to be distinguished from the synods, which took cognizance of matters of general interest. Older Protestant writers have contented themselves with saying either that synods were of apostolic origin, or that they were the inevitable outcome of the need of the leaders of churches to take counsel together, and that they were perhaps modelled on the scurril provincial assemblies (concilia provincialis).

Every important alteration in the constitution of the Church has affected the composition and function of synods; but the changes were neither simultaneous nor precisely alike throughout the Roman empire. The synods of the 2nd century were extra-ordinary assemblies which met to deliberate upon pressing problems. They had no fixed geographical limits for membership, no ex-officio members, nor did they possess an authority which was confined to the independence of the local church. In the course of the 3rd century came the decisive change, which increased the prestige of the councils: the right to vote was limited to bishops. This was the logical outgrowth of the belief that each local church ought to have but one bishop (monarchical episcopate), and that these bishops were the sole legitimate successors of the apostles (apostolic succession), and therefore official organs of the Holy Spirit. Although as late as 250 the consensus of the priests, the deacons and the people was still considered essential to the validity of a conciliar decision at Rome and in certain parts of the East, the development had already run its course in northern Africa. It was a further step in advance when synods began to meet at regular intervals. They were held annually in Cappadocia by the middle of the 3rd century, and the council of Nicaea commanded in 325 that semi-annual synods be held in every province, an arrangement which was not systematically enforced, and was altered in 692, when the Trullan Council reduced the number to one a year.

With the multiplication of synods came naturally a differentiation of type. In textbooks we find clear lines drawn between diocesan, provincial, national, patriarchal and ocumenical synods; but the first thousand years of church history do not justify the sharpness of the traditional distinction. The provincial synods, presided over by the metropolitan (archbishop), were usually held at the capital of the province, and attempted to legislate on all sorts of questions. The state had nothing to do with calling them, nor did their decrees require governmental sanction. Various abortive attempts were made to set up synods of patriarchal or at least of more than provincial rank. In North Africa eighteen such synods were held between 393 and 424; during part of the 5th and 6th centuries primatial councils assembled at Arles; and the patriarchs of Constantinople were accustomed to invite to their “endemic synods” (αποκλεικτα) all bishops who happened to be sojourning at the capital. Papal synods from the 4th and especially from the 9th century onward included members such as the archbishops of Ravenna, Milan, Aquileia and Grado, who resided outside the Roman archdiocese; but the territorial limits from which the membership was drawn do not appear to have been precisely defined.

Before the form of the provincial synod had become absolutely fixed, there arose in the 4th century the ocumenical council. The Greek term συνέδριον οκουμενική (1) (used by Eusebius, Vita Constantini, iii. 6) is preferable to the Latin concilium universale or generale, which has been applied loosely to national and even to provincial synods. The ocumenical synods were not the logical outgrowth of the network of provincial synods; they were creations of the imperial power. Constantine, who had not even been baptized, laid the foundations when, in response to a petition of the Donatists, he referred their case to a committee of bishops that convened at Rome, which meeting Eusebius calls a

1 For the Greek Council see Boule; for the Hebdomadal Council see Oxford; see also England: Local Government.

2 From οκουμενικός, the inhabited world: Latin ocumenicus or universalis. The English forms "ocumenical" and "ocumenical" are both used.
After that the emperor summoned the council of Arles to settle the matter. For both of these assemblies it was the emperor that decided who should be summoned, paid the travelling expenses of the bishops, determined where the council should be held and what topics should be discussed. He regarded them as temporary advisory bodies, to whose recommendations the imperial authority might give the force of law. In the same manner he appointed the time and place for the council of Nicaea, summoned the episcopate, paid part of the expenses out of the public purse, nominated the committee in charge of the order of business, used his influence to bring about the adoption of the creed, and punished those who refused to subscribe. To be sure, the council of Nicaea commanded great veneration, for it was the first attempt to assemble the entire episcopate; but no more than the synods of Rome and of Arles was it an organ of ecclesiastical self-government—it was rather a means whereby the Church was ruled by the secular power. The subsequent oecumenical synods of the undivided Church were patterned on that of Nicaea. Most Protestant scholars maintain that the secular authorities decided whether or not they should be convened, and issued the summons; that imperial commissioners were always present; that if the council refused to act, that on occasion emperors have confirmed or refused to confirm synodal decrees; and that the papal confirmation was neither customary nor requisite. Roman Catholic scholars to-day tend to recede from the high ground very generally taken several centuries ago, and Funk even admits that the right to convocate oecumenical synods was vested in the emperor regardless of the wishes of the pope, and that it cannot be proved that the Roman see ever actually had a share in calling the oecumenical councils of antiquity. Others, however, while acknowledging the futility of seeking historical proofs that the popes formally called, directed and confirmed these synods, yet assert that the emperor performed these functions not of his own right but in his quality as protector of the Church, that this involved his acting at the request or at least with the permission and approval of the Church, and in particular of the pope, and that a special though not a stereotyped papal confirmation of conciliar decrees was necessary to their validity.

In the Germanic states which arose on the ruins of the Western Empire we find synodal and diocesan synods; provincial synods were unusual. National synods were summoned by the king or with his consent to meet special needs; and they were frequently concilia mixta, at which lay dignitaries appeared. Although the Frankish monarchs were not absolute rulers, nevertheless they exercised the right of changing or rejecting synodal decrees which ran counter to the interests of the state. Clovis held the first French national synod at Orleans in 511; Reccared, the first in Spain in 589 at Toledo. Under Charlemagne they were occasionally so representative that they might almost be ranked as general synods of the West (Regensburg, 792, Frankfort, 794). Contemporaneous with the evolution of the national synod was the development of a new type of diocesan synod, which included the priests of separate and mutually independent parishes and also the leaders of the monastic clergy.

The papal synods came into the foreground with the success of the Cluniac reform of the Church, especially from the Lateran synod of 1059 on. They grew in importance until at length Calixtus II. summoned, to the Lateran the synod of 1123 as "generale concilium." The powers which the pope as bishop of the church in Rome had exercised over its synods he now extended to the oecumenical councils. They were more completely under his control than the ancient ones had been under the sway of the emperor. The Pseudo-Isidorean principle that all major synods need papal authorization was insisted on, and the decrees were formulated as papal edicts.

The absolutist principles cherished by the papal court in the 12th and 13th centuries did not pass unchallenged; but the protests of Marsilius of Padua and the less radical William of Occam remained barren until the Great Schism of 1378. As neither the pope in Rome nor his rival in Avignon would give way, recourse was had to the idea that the supreme power was vested not in the pope but in the oecumenical council. This "conciliar theory," propounded by Conrad of GelnhAUSEN and championed by the great Parisian teachers Pierre d'AILLY and Gerson, proceeded from the nominalistic axiom that the whole is greater than its part. The decisive revolutionary step was taken when the cardinals independently of both popes ventured to hold the council of Pisa (1409). The council of Constance asserted the supremacy of oecumenical synods, and ordered that these be convened at regular intervals. The last of the Reform councils, that of Basel, approved these principles, and at length passed a sentence of deposition against Pope Eugenius IV. Eugenius, however, succeeded in maintaining his power, and at the council of Florence (1439) secured the condemnation of the conciliar theory; and this was reiterated still more emphatically, on the eve of the Reformation, by the fifth Lateran council (1516). Thenceforward the absolutist theories of the 13th and 14th centuries increasingly dominated the Roman Church. The popes so distrusted oecumenical councils that between 1517 and 1869 they called but one; at this (Trent, 1545-1563), however, all treatment of the question of papal versus conciliar authority was purposely avoided. Although the Declaration of the French bishops in 1516 (1516) abstracted from its conclusions, since the French Revolution this "Gallicanism" has shown itself to be but a passing phase of constitutional theory; and in the 19th century the ascendency of Ultramontanism became so secure that Pius IX. could confidently summon to the Vatican a synod which set its seal on the doctrine of papal infallibility. Yet it would be a misconception to suppose that the Vatican decrees mean the surrender of the ancient belief in the infallibility of oecumenical synods; their decisions may still be regarded as more solemn and more impressive than those of the pope alone; their authority is fuller, though not higher. At present it is agreed that the pope has the sole right of summoning oecumenical councils, of presiding or appointing presidents and of determining the order of business and the topics which shall come up. The papal confirmation is indispensable; it is conceived of as the stamp without which the expression of conciliar opinion lacks legal validity. In other words, the oecumenical council is now practically in the position of the senate of an absolute monarch. It is in fact an open question whether a council is to be ranked as oecumenical under the papal influence and after its decrees have been confirmed by the pope. (See Vatican Council, Ultramontanism, Infallibility.)

The earlier oecumenical councils have well been called "the pitched battles of church history." Summoned to combat heresy and schism, in spite of degrading pressure from without and tumultuous disorder within, they ultimately brought about a modicum of doctrinal agreement. On the one side as time went on they bound scholarship hand and foot in the winding-sheet of tradition, and also fanned the flames of intolerance; yet on the other side they fostered the sense of the Church's corporate oneness. The diocesan and provincial synods have formed a valuable system of regularly recurring assemblies for disposing of ecclesiastical business. They have been held most frequently, however, in times of stress and of reform, for instance in the 11th, 16th and 19th centuries; at other periods they have lapsed into disuse: it is significant that to-day the prelate who neglects to convene them suffers no penalty. At present the main function of both provincial and oecumenical synods seems to be to facilitate the presentation to the wishes of the central government of the Church.

The right to vote (votum definitum) has been distinguished from early times from the right to be heard (votum consultatum). The Reform Synods of the 15th century gave a decisive vote to doctors and licentiates of theology and of laws, some of them sitting as individuals, some as representatives of universities. Roman Catholic canonists now confine the right to vote at oecumenical councils to bishops, cardinal deacons, generals or vicars general of monastic orders and the praetati nullius (exempt abbeys, &c.); all other persons, lay or clerical, who are admitted or invited, have merely the votum consultatum—they are chiefly procurators of absent bishops, or very learned priests. It was but a clumsy and temporary expedient, designed to offset the preponderance of Italian bishops dependent on the pope
decisions are the sole infallible standard of faith, morals and worship.

Protestant Councils.—The churches of the Reformation have all had a certain measure of synodal life. The Church of England has maintained its ancient provincial synods or convocations, though for the greater part of the 18th and the first part of the 19th centuries they transacted no business. In the Lutheran churches of Germany there was no strong agitation in favour of introducing synods until the 19th century, when, a movement, designed to render the churches less dependent on the governmental consistories, won its way, until at length Prussia itself fell into line (1873 and 1876). As the powers granted to the German synods are very limited, many of their advocates have been disillusioned; but the Lutheran churches of America, being independent of the state, have developed synods both numerous and potent. In the Reformed churches outside Germany synodal life is vigorous; its forms were developed by the Huguenots in days of persecution, and passed thence to Scotland and other presbyterian countries. Even many of the churches of congregational polity have organized national councils (see Congregationalism); but here the principle of the independence of the local church prevents the decisions from binding those congregations which do not approve of the decrees. Moreover, in the last decade of the 19th century a growing desire for a rapprochement between the Free Churches in the United Kingdom as a whole led to the annual assembly of the Free Church Council for the consideration of all matters affecting the dissenting bodies. This body has no executive or doctrinal authority and is rather a conference than a council. In general it may be said that synods are becoming more and more powerful in Protestant lands, and that they are destined to still greater prominence because of the growing sentiment for Christian unity.

Authorities.—General Collections: Collectio regia (Paris, 1644, 37 vols.) (the first very extensive work); P. Labbe (not Labbé) and G. Cassart, Sacrosancta concilia (Paris, 167, 17 vols.), with supplement by Etienne Baluze (Baluzius), 1683 (based on above); J. Hardouin (Hardinus), Conciliorum collectio regia maxima (Paris, 1715); 11 tomi in 12 vols. (to 1714; more exact; indexed; serious omissions); enlarged edition by N. Coletus (Venice, 1728-1732), supplemented by J. D. Mansi, Sacrorum conciliorum et decretorum universalis (Lucca, 1730-40, 12 vols.). Convenient but fallible is Mansi’s Sacrorum conciliorum et decretorum nova et amplissima collectio (Florence, 1759-1767); completed Venice, 1769-1798, 31 vols.; fascimile reproduction by Weltzer (Paris, 1901 ff.), adding (tom. 17-18 and 189, 190) Conciliorum selectiores, and (tom. 17B and 18B) Baluze, Capitularium regum Francorum, and continuing to date by reproducing parts of Coletus and of Mansi’s supplement to Coletus, and furnishing (tom. 37 ff.) a new edition of the French translations of the Councils studied in order of appearance of the text of Roman Catholic synods from 1682 to 1780 in Collectio Laecensis (Acta et decreta conciliorum conciliorum, Fribourg, 1870 ff.), 7 vols.

United States: Collectio Laecensis (Roman Catholic synods); The American Church History Series (New York, 1893 ff., 13 vols.) gives information on the various Protestant synods.

of bricks and tiles, carriages and wagons, agricultural implements, and the products of its railway shops, its manufactures are relatively unimportant, the factory product in 1905 being valued at only $1,924,109.

Council Bluffs is the seat of the Western Iowa Business College, and of the Iowa school for the deaf. On or near the site of Council Bluffs, in 1804, Lewis and Clark held a council with the Indians, whence the city's name. In 1838 the Federal government made this the headquarters of the Pottawattamie Indians, removed from Missouri. They remained until 1846-1847, when the Mormons came, built many cabins, and named the place Kanesville. The Mormons remained only about five years, but on their departure for Utah their places were speedily taken by new immigrants. During 1849-1850 Council Bluffs became an important outfitting point for California gold seekers—the goods being brought by boat from Saint Louis—and in 1853 it was incorporated as a city.

COUNSEL AND COUNSELLOR, of whom one gives advice, more particularly legal advice and is employed as an expert witness. The term “counsel” is employed in England as a synonym for a barrister-at-law, and may refer either to a single person who pleads a case, or collectively, to the body of barristers engaged in a case. Counsellor or, more fully, counsellor-at-law, is practically an obsolete term in England, but is still in use locally in Ireland as an equivalent to barrister. In the United States, a counsellor-at-law is, specifically, an attorney admitted to practice in all the courts; but as there is no formal distinction of the legal profession into two classes, as in England, the term is more often used loosely in the same sense as “lawyer,” i.e., one who is versed in, or practises law.

COUNT (Lat. comes, gen. comitis, Fr. comte, Ital. conte, Span. conde), the English translation of foreign titles equivalent generally to the English “earl.” In Anglo-French documents the word comte was at all times used as the equivalent of earl, but, unlike the feminine form “countess,” it did not find its way into the English language until the 13th century, and then only in the sense defined above. The title of earl, applied by the English to the foreign counts established in England by William the Conqueror, is dealt with elsewhere (see Earl). The present article deals with (1) the office of count in the Roman empire and the Frankish kingdom, (2) the development of the feudal count in France and under the Holy Roman Empire, (3) modern counts.

1. The Latin comes meant literally a companion or companion. In the Roman empire the word was used to designate the companions of the emperor (comites principis) and so became a title of honour. The emperor Hadrian chose senators as companions on his travels and to help him in public business. They formed a permanent council, and Hadrian's successors entrusted these comites with the administration of justice and finance, or placed them in military commands. The designation comes thus developed into a formal official title of high officers of state, some of whom were given the special duties attached to the office in each case. Thus in the 5th century, among the comites attached to the emperor's establishment, we find, e.g., the Comes sacrarum latriae et comites rei privatae; while others, forming the council, were styled comites consistorii. Others were sent into the provinces as governors, comites per provincias constituti; thus in the Notitia dignitatum we find a comes Aegypti, a comes Africae, a comes Belgicae, a comes Lugdenensis and others. Two of the generals of the Roman province of Britain were styled the comes Britanniae and the comes litteris Saxonicis (count of the Saxon shore).

At Constantineople in the latter Roman empire the Latin word comes assumed a Greek garb as κόμης and was declined as a Greek noun (gen. κόμης); the comes sacrarum latriae (count of the sacred bounties) was called at Constantineople κόμης τῶν σωμάτων ἁγιωτάτων et the comes rerum privatarum (count of the private goods) κόμης τῶν ἐξ ἐπαγγελμάτων. The fact that, in English, the title is still used in a foreign language. Actually, only some foreign counts could be said to be equivalent to English earls; but “earl” is always translated by foreigners by words (comte, Graf) in which we are represented by “count” itself never used as the synonym of “earl.” Comtess and English countesses had no hesitation in translating as “earl” foreign titles which we now render “count.”
(count of the private estates) was called κώμη των πριβάτων. The count of the sacred bounties was the lord treasurer, chancellor of the exchequer, for the public treasury and the imperial fisc had come to be identical; while the count of the private estates managed the imperial demesnes and the private purse. In the 5th century the "sacred bounties" corresponded to the aerasium of the early Empire, while the res privatae represented the fisc. The officers connected with the palace and the emperor's person included the count of the wardrobe (comes sacrae vestitis), the count of the residence (comes domorum), and, most important of all, the comes domesticorum et sacri stabuli (graced as κώμη του στάθμου). The count of the stable, originally the imperial master of the horse, developed into the "illustrious" commander-in-chief of the imperial army (Stilicho, e.g., bore the full title as given above), and became the prototype of the medieval constable (q.v.).

An important official of the second rank (spectabilis, "respectable") as contrasted with those of highest rank who were "illustrious") was the count of the East, who appears to have had the control of a department in which 600 officials were engaged. His power was reduced in the 6th century, when he was deprived of most of his administrative powers, and became civil governor of Syria Prima, retaining his "respectable" rank. Another important officer of the later Roman court was the comes sacri patrimonii, who was instituted by the emperor Anastasius. In this connexion it should be observed that the word patrimonium gradually changed in meaning. In the beginning of the 3rd century patrimonium meant crown property, and res privata meant personal property: at the beginning of the 6th century patrimonium meant personal property, and res privata meant crown property. It is difficult to give briefly a clear idea of the functions of the three important officials comes sacrarum largitionum, comes privatae and comes sacri patrimonii; but the terms have been well translated by a German author as Finanzminister des Reichschattes (finance minister of the treasury of the Empire), F. des Kranzkastes (of the crown treasury), and F. des kaiserlichen Privatvermögens (of the emperor's private property).

The Frankish kings of the Merovingian dynasty retained the Roman system of administration, and under them the word comes preserved its original meaning; the comes was vassal who was responsible for the crown. Under the early Frankish kings some comites did not exercise any definite functions; they were merely attached to the king's person and executed his orders. Others filled the highest offices, e.g., the comes palatii and comes stabuli (see Constable). The kingdom was divided for administrative purposes into small areas called pagi (pays, Ger. Gau), corresponding generally to the Roman civitates (see City). At the head of the pagus was the comes, corresponding to the German Graf (Gaugraf, cf. Anglo-Saxon scear-gerefa, sheriff). The comes was appointed by the king and removable at his pleasure, and was chosen originally from all classes, sometimes from enfranchised slaves. His essential functions were judicial and executive, and in documents he is often described as the king's agent (agens publicus) or royal judge (iudex publicus or jussidicis). As the delegate of the executive power he had the right to military command in the king's name, and to take all the measures necessary for the preservation of the peace, i.e. to exercise the royal ban (bannus regis). He was at once public prosecutor and judge, was responsible for the execution of the royal will, and as the king's representative exercised the royal right of protection (mendism regis) over churches, widows, orphans and the like. He enjoyed a triple wergeld, but had no definite salary, being remunerated by the receipt of certain revenues, a system which contained the germs of discord, on account of the confusion of his public and private estates. He also retained a third of the fines which he imposed in his judicial capacity.

Under but early Carolingians, the title count did not indicate noble birth. A comes was generally raised from childhood in the king's palace, and rose to be a count through successive stages. The count's office was not yet a dignity, nor hereditary; he was not independent nor appointed for life, but exercised the royal power by delegation, as under the Merovingians. While, however, he was theoretically paid by the king, he seems to have been himself one of the sources of the royal revenue. The counts were, it appears, farmed out; but in the 7th century the royal choice became restricted to the larger landed proprietors, who gradually emancipated themselves from royal control, and in the 8th century the term comitatius begins to denote a geographical area, though there was little difference in its extent under the Merovingian kings and the early Carolings. The count was about to pass into the feudal stage. Throughout the middle ages, however, the original official and personal connotation of the title was never wholly lost; or perhaps it would be truer to say, with Selden, that it was early revived with the study of the Roman civil law in the 12th century. The unique dignity of the count of the Lateran palace,2 bestowed in 1308 by the emperor Louis the Great, was confirmed by a diploma of Charles V. of France, and Luna, and his heirs male, was official as well as honorary, being charged with the attendance and service to be performed at the palace at the emperor's coronation at Rome (Du Cange, s.v. Comites Palatii Lateranensis; Selden, op. cit. p. 321). This instance, indeed, remained isolated; but the personal title of "count palatine," though honorary rather than official, was conferred on officials—especially by the popes on those of the Curia—had no territorial significance, and was to the last reminiscent of those early comites palatii whose relations to the sovereign had been purely personal and official (see Palatine). A relic of the old official meaning of "count" still survives in Transylvania, where the head of the political administration of the Saxon districts is styled count (comes, Graf) of the Saxon Nation.

2. Feudal Counts.—The process by which the official counts were transformed into feudal vassals almost independent is described in the article FEUDALISM. In the confusion of the period of transition, when the title to possession was usually the power to hold, designations which had once possessed a definite meaning were commonly applied to the various ranks. In France by the 10th century, the process of decomposition of the old organization had gone far, and in the 11th century titles of nobility were still very loosely applied. That of "count" was, as Luchaire points out, "equivocal" even as late as the 12th century; any castellan of moderate rank could style himself comte who in the next century would have been called seigneur (dominus). Even when, in the 13th century, the ranks of the feudal hierarchy in France came to be more definitely fixed, the style of "count" might imply much, or comparatively little. In the oldest register of Philip Augustus counts are reckoned with dukes in the first of the five orders into which the nobles are divided, but the list includes, besides such almost sovereign rulers as the counts of Flanders and Champagne, immediate vassals of much less importance—such as the counts of Soissons and Dammartin—and even one mediate vassal, the count of Bar-sur-Seine. The title was still in fact "equivocal," and so it remained throughout French history. In the official lists it was early placed second to that of duke (Luchaire, Manuel, p. 181, note 1), the count palatine being the first (comes), and the counts palatine under this title long after the Lateran had ceased to be an imperial palace.

1 The changing language of this epoch speaks of citaties, subsequently of pagi, and later of comitatus (counties).

2 The A.S. gerafa, however, meaning "illustrious," "chief," has apparently, according to philologists, no connexion with the German Graf, which originally meant "serving" (cf. "knight," "valet," &c.). It is the more curious that the gerafa should end as a servant ("reeve"), the Graf as a noble (count).
is that the title is very widespread and in itself little significant. A German or Austrian count may be a wealthy noble of princely rank, a member of the Prussian or Austrian Upper House, or he may be the penniless cadet of a family of no great rank or antiquity. Nevertheless the title, which has long been very sparingly bestowed, always implies a good social position. The style Allgraf (old count), occasionally found, is of some antiquity, and means that the title of count has been borne by the family from time immemorial.

In medieval France the significance of the title of count varied with the power of those who bore it; in modern France it varies with its historical associations. It is not so common as in Germany or Italy; because it does not by custom pass to all male descendants. The title was, however, cheapened by its revival under Napoleon. By the decree of the 1st of March 1808, reviving titles of nobility, that of count was assigned ex officio to ministers, senators and life councillors of state, to the president of the Corps Légalise and to archbishops. The title was made heritable in order of primogeniture, and in the case of archbishops through their nephews. These Napoleonic countships, increased under subsequent reigns, have produced a plentiful crop of titles of the same description which, although not necessarily hereditary, the status of the counts deriving from the ancien regime. The title of count in which Napoleon did not revive, has risen proportionately in the estimation of the Faubourg St German. As for that of count, it is safe to say that in France its social value is solely dependent on its historical associations.

Of all European countries Italy has been most prolific of counts. Every petty Italian prince, from the pope downwards, created them for love or money; and, in the absence of any regulating authority, the title was also widely and loosely assumed, while often the feudal title passed with the sale of the estate to which it was attached. Casanova remarked that in some Italian cities all the nobles were baroni, in others all were conti. An Italian conte may or may not be a gentleman; he has long ceased, qua count, to have any social prestige, and his rank is not recognized by the Italian government. As in France, however, there are some Italian conti whose titles are respectable, and even illustrous, from their historic associations. The prestige belongs, however, not to the title but to the name. As for the princely countships, when they are still freely bestowed on those of all nations who appeal to the Holy See wishes to reward, their prestige naturally varies with the religious complexion of the country in which the titles are borne. They are esteemed by the faithful, but have small significance for those outside. In Spain, on the other hand, the title of conde, the earlier history of which follows much the same development as in France, is still of much social value, mainly owing to the fact that the rule of primogeniture exists, and that, a large fee being payable to the state on succession to a title, it is necessarily associated with some degree of wealth. The Spanish counts of old creation, some of whom are grandees and members of the Upper House, naturally take the highest rank; but the title, still bestowed for eminent public services or other reasons, is of value. The title, like others in Spain, can pass through an heiress to her husband. In Russia the title of count (graf, fem. grafynya), a foreign importation, has little social prestige attached to it, being given to officials of a certain rank. In the British empire the only recognized counts are those of Malta, who are given precedence with baronets of the United Kingdom.

**COUNTER.** (1) (Through the O. Fr. conteoir, modern compoir, from Lat. computare, to reckon), a round piece of metal, wood or other material used anciently in making calculations, and now for reckoning points in games of cards, &c., or as tokens representing actual coins or sums of money in gambling games such as roulette. The word is thus used, figuratively, of something of no real value, a sham. In the original sense of a means of counting money,
or keeping accounts," "counter" is used of the table or flat-topped barrier in a bank, merchant's office or shop, on which money is counted and goods handed to a customer. The term has also been used, usually in the form "computer," to denote the defalcations or prison attached to the mayor's or sheriff's courts in London and some other boroughs in England. The "computers" of the sheriff's courts of the city of London were, at various times, in the Poultry, Bread St., Wood St. and Giltspur St.; the Giltspur St. compter was the last to be closed, in 1854. (2) From Lat. contra, opposite, against), a circular parry in fencing, and in boxing, a blow given as a parry to a lead of an opponent. The word is also used of the stuff piece of leather at the back of a boot or shoe, of the rounded angle at the stern of a ship, and, in a horse, of the part lying between the shoulder and the under part of the neck. In composition, counter is used to express contrary action, as in "countermand," "counterfeit," &c.

COUNTERFEITING (from Lat. contra-facere, to make in opposition or contrast), making an imitation without authority and for the purpose of defrauding. The word is more particularly used in connexion with the making of imitations of money, whether paper or coin. (See COINAGE OFFENCES; FORGERY.)

COUNTERFORT (Fr. contrefort), in architecture, a buttress or pier built up against the wall of a building or terrace to strengthen it; or as the thrust of an arch or other constructional feature inside.

COUNTERPOINT (Lat. contrapunctus, "point counterpoint," "note against note"), in music, the art happily defined by Sir Frederick Gore Ouseley as that of "composing" melodies: this should imply that good counterpoint is the production of beautiful harmony by a combination of well-characterized melodies. The individual audibility of the melodies is a matter of which current criticism enormously overrates the importance. What is always important is the peculiar life breathed into harmony by contrapuntal organization. Both historically and aesthetically "counterpoint" and "harmony" are inextricably blended; for nearly every harmonic fact is in its origin a phenomenon of counterpoint. And if in later musical developments it becomes possible to treat chords as, so to speak, harmonic lumps with a meaning independent of counterpoint, this does not mean that they have really changed their nature; but it shows a difference between modern and earlier music precisely similar to that between modern English, in which metaphorical and abstract expressions are used, and that in which the literal and concrete expression, and classical Greek, where metaphors and abstractions can appear only as elaborate similes or explicit philosophical ideas. The laws of counterpoint are, then, laws of harmony with the addition of such laws of melody as are not already produced by the interaction of harmonic and melodic principles. In so far as the laws of counterpoint are derived from purely harmonic principles, that is to say, derived from the properties of concord and discord, their origin and development are discussed in the article HARMONY. In so far as they depend entirely on melody they are too minute and changeable to admit of general discussion; and in so far as they show the interaction of melodic and harmonic principles it is more convenient to discuss them under the head of harmony, because they appear in such momentary phenomena as are more easily regarded as successions of chords than as principles of design. All that remains, then, for the present article is the explanation of certain technical terms.

1. Canto Fermo (i.e. plain chant); a melody in long notes given out on voice while any other melody, or melody with quicker counterpoints (the term "counterpoint" in this connexion meaning accompanying melodies). In the simplest cases the Canto Fermo has notes of equal length and is unbroken in flow. When it is broken up and its rhythm diversified, the gradations between counterpoint on a Canto Fermo and ordinary forms of polyphony, or indeed any kind of melody with an elaborate accompaniment, are infinite and insensible.

2. Double Counterpoint is a combination of melodies so designed that either can be taken above or below the other. When this change of position is effected by merely altering the octave of either or both melodies (with or without transposition of the whole combination to another key), the artistic value of the device is simply that of the raising of the lower melody to the surface. The harmonic scheme remains the same, except in so far as some of the chords are not in their fundamental position, while others, not originally fundamental, have become so. But double counterpoint may be in other intervals than the octave; that is to say, while one of the parts remains stationary, the other may be transposed above or below it by some interval other than an octave, thus producing an entirely different set of harmonies.

Double Counterpoint in the 16th has thus been made a powerful means of expression and variety. The artistic value of this device depends not only on the beauty and novelty of the second scheme of harmony obtained, but also on the change of melodic expression produced by transferring one of the melodies to another position in the scale. Two of the most striking illustrations of this effect are to be found in the last chorus of Brahms's Triumphlied and in the fourth of his variations on a theme by Haydn.

Double Counterpoint in the 17th has, in addition to this, the property that the inverted melody can be given in the new and in the original positions simultaneously.

Double counterpoint in other intervals than the octave, 10th, 12th, etc. are同样是 the classical principle and motives for it remain the same under all conditions. The two subjects of the Confiere in Bach's B minor Mass are in double counterpoint in the octave, 11th and 13th. And Beethoven's Mass in D is full of pieces of double counterpoint in the inversions of which a few notes are displaced so as to produce momentary double counterpoint in unusual intervals, obviously with the intention of varying the harmony. Technical treatises are silent as to this purpose, and leave the student in the belief that the classical composers used these devices, if at all, in a manner as meaningless as the examples in the treatises.

3. Triple, Quadruple and Multiple Counterpoint.—When more than two melodies are designed so as to combine in interchangeably possible positions, it becomes increasingly difficult to avoid chords and progressions of which some inversions are incorrect. In triple counterpoint this difficulty is not so great; although a complete triad is dangerous, as it is apt to invert as a "\( \frac{3}{2} \)" which requires careful handling. On the other hand, in triple counterpoint the necessity for strictness is at its greatest, because, although a long contrapunctal work, it is not the same as a long polyphonic work most of these will be required. Moreover, the artistic value of the device is at its highest in three-part polyphonic harmony, and, whether invertible or not, is always a fine test of artistic economy, while the inversions are as evident to the ear, especially where the top part is concerned, as those in double counterpoint. Triple counterpoint (and a furtiori multiple counterpoint) is normally possible only at the octave; for it will be found that if three parts are designed to invert in some other interval this will involve two of them inverting in a third interval which will give rise to incalculable difficulty. This makes the fourth of Brahms's variations on a theme of Haydn almost miraculous. The plaintive expression of the whole variation is largely due to the fact that the flowing semiquaver counterpoint below the main theme is on each repeat inverted in the 12th, with the result that its chief emphasis falls upon the most plaintive parts of the scale. But in the first eight bars of the second part of the variation a three contrapuntal voice appears, and this too is afterwards inverted in the 17th, with perfectly admirable and completely effective result. This involves the inversion of two of the counterpoints with each other in the 9th, a kind of double counterpoint which is almost impossible. The case is unique, but it admirably illustrates the difference between artistic and merely academic mastery of technical resource.

Quintuple Counterpoint is not rare with Bach. It would be more difficult than triple, but for the fact that its twenty-four possible inversions not more than four or five need be correct. Mozart's Jupiter Symphony is admirably illustrated in the finale of Mozart's Jupiter Symphony, in which everything in the successive statement and gradual development of the five themes compires
to give the utmost effect to their combination in the coda. Of course Mozart has not room for more than five of the 120 possible combinations, and from these he selects such as bring fresh themes into the outside parts, which are the most clearly audible. Sextuple COUNTERPOINT may be found in Bach's great double chorus, Nun ist das Heil, and in the final: of his concerto for three claviers in C, and probably in other places.

4. Added Thirds and Sixths.—An easy and effective imitation of triple and quadruple counterpoint, embodying much of the artistic value of inversion, is found in the numerous combinations of themes in thirds and sixths which arise from an extension of the principle which we mentioned in connexion with double counterpoint in the 10th, namely, the possibility of performing it in its original and inverted positions simultaneously. The Pleni sunt coeli of Bach's B minor Mass is written in this kind of transformation of double into quadruple counterpoint; and the artistic value of the device is perhaps never so magnificently realized as in the place, at bar 84, where the trumpet doubles the bass three octaves and a third above while the alto and second tenor have the counter subjects in close thirds in the middle. Almost all other contrapuntal devices are derived from the principle of the canon and are discussed in the article CONTRAPUNTAL FORMS.

As a term in musical grammar and style, the rhythms of 16th-century polyphony were early codified into "the five species of counterpoint" (with various other species now forgotten) and practised by students of composition. The classical treatise on which Haydn and Beethoven were trained was Fux's Gradus ad Parnassum (1725). This was superseded in the 18th century by Cherbini's, the first of a long series of attempts to bring up to date as a dead language what should be studied in its original and living form. (D. F. T.)

COUNTERSCARP ("opposite scarp," Fr. contrescarpe), a term used in fortification for the outer slope of a ditch; see FORTIFICATION AND SIEGECRAFT.

COUNTERSIGN, a military term for a sign, word or signal previously arranged and required to be given by persons approaching a sentry, guard or other post. In some armies the "counter-sign" is strictly the reply of the sentry to the pass-word given by the person approaching.

COUNTRY (from the Mod. Eng. contre or contrie, and O. Fr. conté); Late Lat. contrata, showing the derivation from contra, opposite, over against, thus the tract of land which fronts the sight, cf. Ger. Gegcn, neighbourhood), an extent of land without definite limits, or such a region with some peculiar character, as the "black country," the "ten country" and the like. The extension from such descriptive limit to the limitation of occupation by particular owners or races is easy; this gives the common use of the word for the land inhabited by a particular nation or race. Another meaning is that part of the land not occupied by towns, "rural" as opposed to "urban" districts; this appears too in "country-house" and "country town"; so too "countryman" is used both for a rustic and for the native of a particular land. The word appears in many phrases, in the sense of the whole population of a country, and especially of the general body of electors, as in the expression "go to the country," for the dissolution of parliament preparatory to a general election.

COUNTRY (through Norm. Fr. counté, cf. O. Fr. cunté, conté; Mod. Fr. comté, from Lat. comitatus, cf. Ital. comitato, Prov. comtato; see Count), in the most usual sense the name given to certain important administrative divisions in the United Kingdom, the British dominions beyond the seas, and the United States of America. The word was first introduced after the Norman Conquest as the equivalent of the old English "shire," which has survived as its synonym, though occasionally also applied to divisions smaller than counties, e.g. Norhamshire, Hampshire and Hallamshire. The word "county" is also sometimes used, alternatively with "countship," to translate foreign words, e.g. the French comté and the German Grafenschaft, which connote the territorial jurisdiction of a count (q.v.). The present article is confined to a sketch of the origin and development of English counties, which have served in a greater or less degree as the model for the county organizations in the various countries of the English-speaking world which are described under their proper headings.

About one-third of the English counties represent ancient kingdoms, sub-kingdoms or tribal divisions, such as Kent, Sussex, Norfolk, Devon; but most of the remaining counties take their names from some important town within their respective boundaries. The counties to the south of the Thames (except Cornwall) already existed in the time of Alfred, but those of the midlands seem to have been created during the reign of Edward the Elder (901-925) and to have been artificially bounded areas lying around some stronghold which became a centre of civil and military administration. There is reason, however, for thinking that the counties of Bedford, Cambridge, Huntingdon and Northampton are of Danish origin. Northumberland, Cumberland and Westmorland were not recognized as English counties until some time after the Norman Conquest, the last two definitely appearing as fiscal areas in 1177. The origin of Rutland as a county is obscure, but it had its own sheriff in 1154.

In the period preceding the Norman Conquest two officers appear at the head of the county organization. These are the ealdorman or earl, and the scirgerofa or sheriff. The shires of Wessex appear each to have had an ealdorman, whose duties were to command its military forces, to preside over the county assembly (scirgeman), to carry out the laws and to execute justice. The name ealdorman gave way to that of earl, probably under Danish influence, in the first half of the 11th century, and it is probable that the office of sheriff came into existence in the reign of Canute (1017-1035), when the great earldoms were formed and it was no longer possible for the earl to perform his various administrative duties in person in a group of counties.

After the Norman Conquest the earl was occasionally appointed sheriff of his county, but in general his only official connexion with it was to receive the third penny of its pleas, and the earldom ceased to be an office and became merely a title. In the 12th century the office of coroner was created, two or more of them being chosen in the county court as vacancies occurred. In the same century warders were first chosen in the same manner for the purpose of holding inquisitions on vert and venison in those counties which contained royal forests. It was the business of the sheriff (vicecomes) as the king's representative to serve and return all writs, to levy distresses on the king's behalf, to execute all royal precepts and to collect the king's revenue. In this work he was assisted by a large staff of clerks and bailiffs who were directly responsible to him and not to the king. The sheriff also commanded the armed forces of the crown within his county, and either in person or by deputy presided over the county court which was now held monthly in most counties. In 1360 it was enacted that the sheriffs might be chosen by the county, except in Worcestershire, Cornwall, Rutland, Westmorland and Lancashire, where there were then sheriffs in fee, that is, sheriffs who held their offices hereditarily by royal grant. The elective arrangement was of no long duration, and it was finally decided in 1340 that the sheriffs should be appointed by the chancellor, the treasurer and the chief baron of the exchequer, but should hold office for one year only. The office was divided into an early period regarded as a community, and approached the king as a corporate body, while in later times petitions were presented through the knights of the shire. It was also an organic whole for the purpose of the conservation of the peace. The assessment of taxation by commissioners appointed by the county court developed in the 13th century into the representation of the county by two knights of the shire elected by the county court to serve in parliament, and this representation continued unaltered save for a short period during the Protectorate, until 1832, when many of the counties received a much larger representation, which was still further increased by later acts.

The royal control over the county was strengthened from the 14th century onward by the appointment of justices of the peace.
This system was further developed under the Tudors, while in the middle of the 16th century the military functions of the sheriff were handed over to a new officer, the lord-lieutenant, who is now more prominently associated with the headship of the county than is the sheriff. The lord-lieutenant now usually holds the older office of custos rotulorum, or keeper of the records of the county. The justices of the peace are appointed upon his nomination, and until lately he appointed the clerk of the peace. The latter appointment is now made by the joint committee of quarter sessions and county council.

The Tudor system of local government received little alteration until the establishment of county councils by the Local Government Act of 1888 handed over to an elected body many of the functions previously exercised by the nominated justices of the peace. For the purposes of this Act the ridings of Yorkshire, the divisions of Lincolnshire, east and west Sussex, east and west Suffolk, the soke of Peterborough and the Isle of Ely are regarded as counties, so that there are now sixty administrative counties of England and Wales. Between 1573 and 1602 the crown granted to certain cities and boroughs the privilege of being counties of themselves. There were in 1835 eighteen of these counties corporate, Bristol, Chester, Coventry, Gloucester, Lincoln, Norwich, Nottingham, York and Carmarthen, each of which had its own native sheriff, and six others, the boroughs of London, Newcastle upon Tyne, Poole, Southampton, Worcester and Haverfordwest, each of which had one sheriff. All these boroughs, with the exception of Carmarthen, Lichfield, Poole and Haverfordwest, which remain counties of themselves, and forty-seven others, were created county boroughs by the Local Government Act 1888, and are entirely dissociated from the control of a county council. The City of London is also a county of itself, whose two sheriffs are also sheriffs of Middlesex, while for the purposes of the act of 1888 the house-covered district which extends for many miles round the City constitutes a county.

The county has always been the unit for the organization of the militia, and from about 1782 certain regiments of the regular army were associated with particular counties by territorial titles. The army scheme of 1907-1908 provided for the formation of county associations under the presidency of the lord-lieutenant for the organization of the new territorial army.

See Statutes of the Realm; W. Stubbs, Constitutional History of England (1874-1878); F. W. Maitland, Domesday Book and Beyond (1897); Sir F. Pollock and F. W. Maitland, History of English Law (1895); H. M. Chadwick, Studies on Anglo-Saxon Institutions (1903), and H. E. Salter, The Courts of England (1891-1911).

COUNTY COURT, in England, a local court of civil jurisdiction. The county court, it has been said, is at once the most ancient and the most usual of English civil tribunals. The Saxon Curia Comitatus, maintained after the Norman Conquest, was a local court and a small debts court. It was instituted by Alfred the Great, its jurisdiction embracing civil, and, until the reign of William I, ecclesiastical matters. The officers of the court consisted of the ealdorman, the bishop and the sheriff. The court was held once in every four weeks, being presided over by the earl, or, in his absence, the sheriff. The suitors of the court, i.e. the freeholders, were the judges, the sheriff being simply a presiding officer, pronouncing and afterwards executing the judgment of the court. The court was not one of record. The appointment of judges of assize in the reign of Henry II, as well as the expensive and dilatory procedure of the court, brought about its gradual disuse, and other local courts, termed courts of request or of conscience, were established. These, in turn, proved unsatisfactory, owing both to the limited nature of their jurisdiction (restricted to causes of debt not exceeding 40s. in value, subject to the fact that they were confined to particular places. Accordingly, with the view of making justice more accessible the County Courts Act 1846 was passed. This act had the modest title of "An Act for the Recovery of Small Debts and Demands in England." The original limit of the jurisdiction of the new courts was £5, extended in 1850 to £50 in actions of debt, and in 1903 (by an act which came into force in 1905) to £100. Thirteen amending acts were passed, by which new jurisdiction was from time to time conferred on the county courts, and in the year 1888 an act was passed repealing the previous acts and consolidating their provisions, with some amendment. This is now the code or charter of the county courts.

The grain of mustard-seed sown in 1846 has grown into a goodly tree, with branches extending over the whole of England and Wales; and they embrace within their ambit a more multifarious jurisdiction than is possessed by any other courts in the kingdom. England and Wales were mapped out into 59 circuits (not including the city of London), with power for the crown, by order in council, to abolish any circuit and rearrange the areas comprised in the circuits (sec. 4). There is one judge to each circuit, but the lord chancellor is empowered to appoint two judges in a circuit, provided that the total number of judges does not exceed 60. The salary of a county court judge was originally fixed at £1,200, but he now receives £1,500. He must at the time of his appointment be a barrister-at-law of at least seven years' standing, and not more than sixty years of age, after appointment he cannot sit as a member of parliament or practise at the bar.

Every circuit (except in Birmingham, Clerkenwell, and Westminster) is divided into districts, in each of which there is a court, with a registrar and bailiffs. The judges are directed to attend and hold a court in each district at least once in every term; and the lord chancellor shall otherwise direct (sec. 10, 11). But in practice the judge sits several times a month in the large centres of population, and less frequently than once a month in the court town of sparsely inhabited districts. By sec. 185 of the act of 1888 the judges and officers of the city of London court have the like jurisdiction, powers, and authority as those of a county court, and the county court rules apply to that court.

The ordinary jurisdiction of the county courts may be thus tabulated:

<table>
<thead>
<tr>
<th>Subject matter</th>
<th>Pecuniary limit of jurisdiction</th>
</tr>
</thead>
<tbody>
<tr>
<td>Common-law actions, with written consent of both parties</td>
<td>Unlimited.</td>
</tr>
<tr>
<td>Actions founded on contract (except for breach of promise of marriage, in which the county courts have no jurisdiction)</td>
<td>£100.</td>
</tr>
<tr>
<td>Actions founded on tort (except libel, slander, and seduction, in which the county courts have no jurisdiction)</td>
<td>£100.</td>
</tr>
<tr>
<td>Counter claims (unless plaintiff gives written notice of objection)</td>
<td>Unlimited.</td>
</tr>
<tr>
<td>Ejectment or questions of title to reality</td>
<td>£100 annual value.</td>
</tr>
<tr>
<td>Equity jurisdiction</td>
<td>£500.</td>
</tr>
<tr>
<td>Probate jurisdiction</td>
<td>£200 for personalty and £300 for realty.</td>
</tr>
<tr>
<td>Admiralty jurisdiction</td>

<tr>
<td>Actions in tort transferred from High Court</td>
<td>Unlimited.</td>
</tr>
<tr>
<td>Companies (winding up), when the paid-up capital does not exceed</td>
<td>£10,000.</td>
</tr>
</tbody>
</table>

There is no discoverable principle upon which these limits of the jurisdiction of the county courts have been determined. But the above table is not by any means an exhaustive statement of the jurisdiction of the county courts. For many years it has been the practice of parliament to throw on the county court judges the duty of acting as judges or arbitrators for the purpose of new legislation relating to social subjects. It is impossible to classify the many statutes which have been passed since 1846 and which confer some jurisdiction, apart from that under the County Courts Act, on county courts or their judges. Some of these acts impose exceptional duties on the judges of the county courts, others confer unlimited jurisdiction concurrently with the High Court or some other court, others, again, confer limited, or sometimes, exclusive jurisdiction. A list of all the acts will be found in the Annual County Courts Practice. A county court judge may determine all matters of fact as well as law, but a jury may be summoned at the option of either plaintiff or defendant when the amount in dispute exceeds £5, and in actions under £5 the judge may in his discretion, on application of either of the parties, order that the action be tried by jury. The number of
COUPÉ—COURBET

318

jurymen impanelled and sworn at the trial was, by the County Courts Act 1903, increased from five to eight.

There is an appeal from the county courts on matters of law to a divisional court of the High Court, i.e. to the admiralty division in admiralty cases and to the king’s bench division in other cases (sec. 120 of act of 1888). The determination of the divisional court is final, unless leave be given by that court or the court of appeal (Judicature Acts 1874). (See further Appeal.) In proceedings under the Workmen’s Compensation Act the appeal from a county court judge is to the court of appeal, with a subsequent reference to the House of Lords. In 1908 a Committee was appointed by the lord chancellor “to inquire into certain matters of county court procedure.” The committee presented a report in 1909 (H.C. 71), recommending the extension of existing county court jurisdiction, but a bill introduced to give effect to the recommendations was not proceeded with.

See Annual County Courts Practice, also “Fifty Years of the English County Courts,” by County Court Judge Sir T. W. Snagge, in Nineteenth Century, October 1897.

COUPÉ (French for “cut off”), a small closed carriage of the brougham type, with four wheels and seats for two persons; the term is also used of the front compartment on a diligence or mail-coach. The front compartment of a railroad carriage with seats on one side only.

COUPLET, a pair of lines of verse, which are welded together by an identity of rhyme. The New English Dictionary derives the use of the word from the French couplet, signifying two pieces of iron riveted or hinged together. In rhyed verse two lines which complete a meaning in themselves are particularly known as a couplet. Thus, in Pope’s Eloisa to Abelard:

“Speed the soft intercourse from soul to soul,
And waft a sigh from Indus to the Pole.”

In much old English dramatic literature, when the mass of the composition is in blank verse or even in prose, particular emphasis is given by closing the scene in a couplet. Thus, in the last act of Beaumont and Fletcher’s Thierry and Theodoret the action culminates in an unexpected rhyme:

“...And now lead on; they that shall read this story
Shall find that virtue lives in good, not glory.”

In French literature, the term couplet is not confined to a pair of lines, but is commonly used for a stanza. A “square” couplet, in French, for instance, is a strophe of eight lines, each composed of eight syllables. In this sense it is employed to distinguish the more emphatic parts of a species of verse which is essentially gay, graceful and frivolous, such as the songs in a vaudeville or a comic opera. In the 18th century, Le Sage, Piron and even Voltaire did not hesitate to engage their talents on the production of couplets, which were often witty, if they had no other merit, and were well fitted to catch the popular ear. This significance of the word couplet is not unknown in England, but it is not customary; it is probably used in a stricter and a more technical sense to describe a pair of rhymed lines, whether serious or merry. The normal type, as it may almost be called, of English versification is the metre of ten-syllabled rhymed lines designated as heroic couplet. This form of iambic verse, with five beats to each line, is believed to have been invented by Chaucer, who employs it first in the Prologue The Legend of Good Women the composition of which is attributed to the year 1385. That poem opens with the couplet:

“A thousand times have I heard man tell
That there is joy in heaven and pain in hell.”

This is an absolutely correct example of the heroic couplet, which ultimately reached such majesty in the hands of Dryden and such brilliancy in those of Pope. It has been considered proper for didactic, descriptive and satirical poetry, although in the course of the 19th century blank verse largely took its place. Epigram often selects the couplet as the vehicle of its sharpened arrows, as in Sir John Harington’s

“Treason doth never prosper: what’s the reason?
Why, if it prosper, none dare call it treason.”

(E. G.)

COUPON (from Fr. couper, to cut), a certificate entitling its owner to some payment, share or other benefit; more specifically, one of a series of interest certificates or dividend warrants attached to a bond running for a number of years. The word coupon (a piece cut off) possesses an etymological meaning so comprehensive that, while on the Stock Exchange it is only used to denote such an interest certificate or a certificate of stock of a joint-stock company, it may be as suitably, and elsewhere is perhaps more frequently, applied to tickets sold by tourist agencies and others. The coupons by means of which the interest on a bond or debenture is collected are generally pasted at the side or foot of that document, to be cut off and presented for payment at the bank or agency named on them as they become due. The last portion, called a “talon,” is a form of certificate, and entitles the holder, when all the coupons have been presented, to obtain a fresh coupon sheet. They pass by delivery, and are as a rule exempt from stamp duty. Coupons for the payment of dividends are also attached to the share warrants to bearer issued by some joint-stock companies. The coupons on the bonds of most of the principal foreign loans are payable in London in sterling as well as abroad.

COURANTE (a French word derived from courir, to run), a dance in 3-2 time march in vogue in France in the 17th century (see DANCE). It is also a musical term for a movement or independent piece based on the dance. In a suite it followed the Allemande (q.v.), with which it is contrasted in rhythm.

COURAYER, PIERRE FRANCOIS LE (1681–1776), French Roman Catholic theological writer, was born at Rouen on the 17th of November 1681. While canon regular and librarian of the abbey of Saint-Germain, Paris, he conducted a correspondence with Archbishop Wake on the subject of episcopal succession in England, which supplied him with material for his work, Dissertation sur la validité des ordinations des Anglais et sur la succession des évêques de l’Église anglicane, avec les preuves justificatives des faits avoués (Brussels, 1723; Eng. trans. by D. Williams, London, 1725; reprinted Oxford, 1844, with memoir of the author), an attempt to prove that there has been no break in the line of ordination from the apostles to the English clergy. His opinions exposed him to a prosecution, and with the help of Bishop Atterbury, then in exile in Paris, he took refuge in England, where he was presented by the university of Oxford with a doctor’s degree. In 1736 he published a French translation of Paolo Sarpi’s History of the Council of Trent, and dedicated it to Queen Caroline, from whom he received a pension of £200 a year. Besides this he translated Sleidan’s History of the Reformation, and wrote several theological works. He died in London on the 15th of October 1776, and was buried in the cloisters of Westminster Abbey. In his will, dated two years before his death, he declared himself still a member of the Roman Catholic Church, although dissenting from many of its opinions.

COURBET, GUSTAVE (1819–1877), French painter, was born at Ornans (Doubs) on the 10th of June 1819. He went to Paris in 1839, and worked at the studio of Steuben and Hesse; but his independent spirit did not allow him to remain there long, as he preferred to work out his own way by the study of Spanish, Flemish and French painters. His first works, an “Odalisque,” suggested by Victor Hugo, and a “Lélia,” illustrating George Sand, were literary subjects; but these he abandoned for the study of real life. Among other works he painted his own portrait with his dog, and “The Man with a Pipe,” both of which were rejected by the jury of the Salon; but the younger school of critics, the neo-romantics and realists, loudly sang the praises of Courbet, who by 1849 began to be famous, producing such pictures as “After Dinner at Ornans” and “The Valley of the Loire.” The Salon of 1850 found him triumphant with the “Burial at Ornans,” the “Stone-Breakers” and the “Peasants of Flazey.” His style still gained in individuality, as in Village Damsels (1852), the “Wrestlers,” “Bathers,” and “A Girl Spinning” (1855). Though Courbet’s realistic work is not of the highest importance, it is as a landscape and sea painter that he will be most honoured by posterity. Sometimes, it must be owned, his realism is rather coarse and brutal, but when he paints the forests of Franche-Comté, the “Stag-Fight,” “The Wave,” or the “Haunt of the Doe,” he is inimitable. When Courbet had
COURBEVOIE—COURIER, P. L.

319

made a name as an artist he grew ambitious of other glory; he tried to promote democratic and social science, and under the Empire he wrote essays and dissertations. His refusal of the cross of the Legion of Honour, offered to him by Napoleon III.,

made him immensely popular, and in 1871 he was elected,

under the Commune, to the chamber. Thus it happened that he was responsible for the destruction of the Vendôme column.

A council of war, before which he was tried, condemned him to pay the cost of restoring the column, 300,000 francs (£12,000).

To escape the necessity of working to the end of his days at the orders of the State in order to pay this sum, Courbet went to Switzerland in 1873, and died at La Tour du Pelz, on the 31st of December 1877, of a disease of the liver aggravated by intemperance.

An exhibition of his works was held in 1882 at the École des Beaux-Arts.

COURBEVEOE, a town of northern France, in the department of Seine, 5 m. W.N.W. of Paris on the railway to Versailles. Pop. (1906) 26,339. It is a residential suburb of Paris, and has a fine avenue opening on the Neuilly bridge, and forming with it a continuation of the Champs Elysées. It carries on biscuit-making and the manufacture of carriage bodies, awnings, dresses, biscuits, &c.

COURCELLE-SENEUIL, JEAN GUSTAVE (1813–1892), French economist, was born at Seneuil (Dordogne) on the 22nd of December 1813. Seneuil was an additional name adopted from his native place. Devoting himself at first to the study of the law, he was called to the French bar in 1835. Soon after, however, he returned to Dordogne and settled down as a manager of ironworks. He found leisure to study economic and political questions, and was a frequent contributor to the republican papers. On the establishment of the second republic in 1848 he became director of the public offices. After the coup d'état of Napoleon III. in 1851 he went to South America, and held the professorship of political economy at the National Institute of Santiago, in Chile, from 1853 to 1863, when he returned to France.

In 1879 he was made a councillor of state, and in 1882 was elected a member of the Académie des sciences morales et politiques. He died at Paris on the 29th of June 1892. Courcille-Seneuil, as an economist, was strongly inclined towards the liberal school, and was equally partial to the historical and experimental methods; but his interest was directed to applied economy and social questions. His principal work is Traité théorique et pratique d'économie politique (2 vols., 1858); among his others may be mentioned Traité théorique et pratique des opérations de banque (1853); Études sur la science sociale (1862); La Banque libre (1867); Liberté et socialisme (1868); Protection et libre échange (1870); he also translated into French John Stuart Mill’s Principles.

COURCI, JOHN DE (d. 1217?), Anglo-Norman conqueror of Ulster, was a member of a celebrated Norman family of Oxfordshire and Somersetshire, whose parentage is unknown, and around whose career a mass of legend has grown up. It would appear that he accompanied William Fitz-Aldelm to Ireland when the latter, after the death of Strongbow, was sent thither by Henry II., and that he immediately headed an expedition from Dublin to Ulster, where he took Downpatrick, the capital of the northern kingdom. After some years of desultory fighting de Courci established his power over that part of Ulster comprised in the modern counties of Antrim and Down, throughout which he built a number of castles, where his vast knitting accounted for the submission of the five tribes. After the accession of Richard I., de Courci in conjunction with William de Lacy appears in some way to have offended the king by his proceeding in Ireland. De Lacy quickly made his peace with Richard, while de Courci defied him; and the subsequent history of the latter consisted mainly in the vicissitudes of a lasting feud with the de Lacys. In 1204 Hugh de Lacy utterly defeated de Courci in battle, and took him prisoner. De Courci, however, soon obtained his liberty, probably by giving hostages as security for a promise of submission which he failed to carry out, seeking an asylum instead with the O'Neills of Tyrone. He again appeared in arms on hearing that Hugh de Lacy had obtained a grant of Ulster with the title of earl, and in alliance with the king of Man he ravaged the territory of Down; but was completely routed by Walter de Lacy, and disappeared from the scene till 1207, when he obtained permission to return to England. In 1210 he was in favour with King John, from whom he received a pension, and whom he accompanied to Ireland. There is some indication of his having sided with John in his struggle with the barons; but of the later history of de Courci little is known. He probably died in the summer of 1219. Both de Courci and his wife Affreca were benefactors of the church, and founded several abbey and priories in Ulster.

A story is told that de Courci when imprisoned in the Tower volunteered to act as champion for King John in single combat against a knight representing Philip Augustus of France; that when he appeared in the lists his French opponent fled in panic; whereupon de Courci, to gratify the French king's desire to witness his prowess, "clut a massive helmet in twain at a single blow," a feat for which he was rewarded by a grant of the privilege for himself and his heirs to remain covered in the presence of the king and all future sovereigns of England. This privilege still finds place in the accounts of the baron Kingsale, a descendant of the de Courci family, is a legend without historic foundation which did not obtain currency till centuries after John de Courci's death. The statement that he was created earl of Ulster, and that he was thus "the first Englishman dignified with an Irish title of honour," is equally devoid of foundation. John de Courci left no legitimate children.

COURIER, PAUL LOUIS (1773–1852), French Hellenist and political writer, was born in Paris on the 4th of January 1773. Brought up on his father's estate of Mérel in Touraine, he conceived a bitter aversion for the nobility, which seemed to strengthen with time. He would never take the name “de Mérel,” to which he was entitled, lest he should be thought a noblemen. At the age of fifteen he was sent to Paris to complete his education; his father's teaching had already inspired him with a passionate devotion to Greek literature, and although he showed considerable mathematical ability, he continued to devote all his leisure to the classics. He entered the school of artillt at Châlons, however, and immediately on receiving his appointment as sub-lieutenant in September 1793 he joined the army of the Rhine. He served in various campaigns of the Revolutionary wars, especially in those of Italy in 1798–99 and 1806–7, and in the German campaign of 1809. He became chef d'escadron in 1803.

He made his first appearance as an author in 1802, when he contributed to the Magasin encyclopédique a critique on Johannes Schweighäuser's edition of Athenaeus. In the following year appeared his Éloge d'Hélène, a free imitation rather than a translation from Isocrates, which he had sketched in 1798. Courier had given up his commission in the autumn of 1808, but the general enthusiasm in Paris over the preparations for the new campaign affected him, and he attached himself to the staff of a general of artillery. But he was horror-struck by the carnage at Wagram (1800), refusing from that time to believe that there was any art in war. He hastily quitted Vienna, escaping the formal charge of desertion because his new appointment had not been confirmed. The savage independence of his nature and bound subordination intolerable to him; he had been three times disgraced for absenting himself without leave, and his superiors resented his satirical humour. After leaving the army he went to Florence, and was fortunate enough to discover in the Laurentian Library a complete manuscript of Longus's Daphnis and Chloe, an edition of which he published in 1810. In consequence of a misadventure—blotting the manuscript—he was

- [Image 0x0 to 276x379]
involved in a quarrel with the librarian, and was compelled by the government to leave Tuscany. He retired to his estate at Vértet (Indre-et-Loire), but frequently visited Paris, and divided his attention between literature and his farm. After the second restoration of the Bourbons the career of Courier as political pamphleteer began. He had before this time waged war against local wrongs in his own district, and had been the adviser and helpful friend of his neighbours. He now made himself by his letters and pamphlets one of the most dreaded opponents of the government of the Restoration. The first of these was his Pétition aux deux chambres (1816), exposing the sufferings of the peasantry under the royalist reaction. In 1817 he was a candidate for a vacant seat in the Institute; and failing, he took his revenge by publishing a bitter Lettre à Messieurs de l’Académie des Inscriptions et Belles-Lettres (1819). This was followed (1819-1820) by a series of political letters of extraordinary power published in Le Courrier Européen. He advocated a liberal monarchy, at the head of which he doubtless wished to see Louis Philippe. The proposal, in 1821, to purchase the estate of Chambord for the duke of Bordeaux called forth from Courier the Simple Discours de Paul Louis, vincible de la Couronne, one of his best pieces. For this he was condemned to six years in prison and to pay a fine. Before he went to prison he published a compte rendu of his trial, which had a still larger circulation than the Discours itself. In 1823 appeared the Livret de Paul Louis, la Gazette de village, followed in 1824 by his famous Pamphlet des pamphlets, called by his biographer, Armand Carrel, his swan-song. Courier published in 1807 his translation from Xenophon, Du commandement de la cavalerie et de l’équitation, and published a study on the subject-matter. After he had formed a beginning for the collection of his works, the secret and device of his talent, which gives his writings a value independent of the somewhat ephemeral subject-matter.

A Collection complète des pamphlets politiques et opuscules littéraires de P. L. Courier appeared in 1826. See editions of his Oeuvres (1848), with an admirable biography by Armand Carrel, which is reproduced in the Bibliothèque nationale, with a supplementary criticism by F. Sarcey (1859-1877); also three notices by Sainte-Beuve in the Cours de lundi and the Nouveaux Lundi.

COURIER (from the O. Fr. courrier, modern courrier, from Lat. currere, to run), properly a running messenger, who carried despatches and letters; a system of couriers, mounted or on foot, formed the beginnings of the modern post-office (see POST, and POSTAL SERVICE). The despatches which pass between the foreign office and its representatives abroad, and which cannot be entrusted to the postal service or the telegraph, are carried by special couriers, styled, in the British service, King’s Messengers. “Courier,” more particularly, is applied to a travelling attendant, whose duties are to arrange for the carriage of messages, obtaining of passports, setting of hotels, accommodation, and generally to look to the comfort and facility of travel. The name “courier” and the similar word “corriant” (Ital. corriano) have often been used as the title of a newspaper or periodical (see NEWSPAPERS); the Courier, founded in 1792, was for some time the leading London journal.

COURLAND, or KURLAND, one of the Baltic provinces of Russia, lying between 55° 45’ and 57° 45’ N. and 21° and 27° E. It is bounded on the N.E. by the river Dvina, separating it from the governments of Vitbisk and Livonia, N. by the Gulf of Riga, W. by the Baltic, and S. by the province of East Prussia and the Russian government of Kovno. The area is 10,535 sq. m., of which 101 sq. m. are occupied by lakes. The surface is generally low and undulating, and the coast-lands flat and marshy. The interior is characterized by wooded dunes, covered with pine, fir, birch and oak, with swamps and lakes, and fertile patches between. The surface nowhere rises more than 700 ft. above sea-level. The Mitau plain divides it into two parts, of which the western is fertile and thickly inhabited, except in the north, while the eastern is less fertile and thinly inhabited. One-third of the area is still forest.

COURLAND is drained by nearly one hundred rivers, of which only three, the Divina, the Aa and the Windau, are navigable. They all flow north-westwards and discharge into the Baltic Sea. Owing to the numerous lakes and marshes, the climate is damp and often foggy, as well as changeable, and the winter is severe. Agriculture is the chief occupation, the principal crops being rye, barley, oats, wheat, flax and potatoes. The land is mostly owned by nobles of German descent. In 1863 laws were issued to enable the Letts, who form the bulk of the population, to acquire the farms which they held, and special banks were founded to help them. By this means some 12,000 farms were bought by their occupants; but the great mass of the population are small farmers, and live by hiring themselves, occupying a low position in the social scale. On the large estates agriculture is conducted with skill and scientific knowledge. Fruit grows well. Excellent breeds of cattle, sheep and pigs are kept. Libau and Mitau are the principal industrial centres, with iron-works, agricultural machinery works, tanneries, glass and soap works. Flax spinning is mostly a domestic industry. Iron and limestone are the chief minerals; a little amber is found on the coast. The only seaports are Libau, Windau and Polangen, there being none on the Courland coast of the Gulf of Riga. The population was 619,154 in 1876; 644,437 in 1897, of whom 345,756 were women; 714,200 (estimate) in 1906. Of the whole, 70 % are Letts, 81 % Germans, 1-7 % Russians, and 1 % each Poles and Lithuanians. In addition there are about 8 % Jews and some Lives. The chief towns of the ten districts are Mitau (Dobleniski district), capital of the government (pop. 35,001 in 1867), Bauske (6343), Friedrichstadt (5223), Goldingen (9733), Grabin (4898), Haasenpoth (338), Illutz (2340), Talsen (6215), Tuckum (7542) and Windau (7134). The prevailing religion is the Lutheran, to which 66 % of the population belong; the rest belong to the Orthodox Eastern and the Roman Catholic churches.

Anciently Courland was inhabited by the Courts or Kurs, a Lettish tribe, who were subdued and converted to Christianity by the Brethren of the Sword, a German military order, in the first quarter of the 13th century. In 1237 it passed under the rule of the Teutonic Knights owing to the amalgamation of this order with that of the Brethren of the Sword. At that time it comprised the two duchies of Courland and Semgallen. Under the increasing pressure of Russia (Muscovy) the Teutonic Knights in 1561 found it expedient to put themselves under the suzerainty of Poland, the grandmaster Gotthard Kettler (d. 1587) becoming the first duke of Courland. The duchy suffered severely in the Russo-Swedish wars of 1700-9. But by the marriage in 1710 of Kettler’s descendant, Duke Frederick William (d. 1711), to the princess Anne, niece of Peter the Great and afterwards empress of Russia, Courland came into closer relations with that state. Anne being duchess of Courland from 1712 to 1730. The celebrated Marshal Saxe was elected duke in 1726, but only managed to maintain himself by force of arms till the next year. The last Kettler, William, titular duke of Courland, died in 1737, and the empress Anne now bestowed the dignity on her favourite Biren, who held it from 1737 to 1740 and again from 1763 till his death in 1772. During nearly the whole of the 18th century Courland, devastated by continual wars, was a shattercock between Russia and Poland; and eventually in 1795 the assembly of the nobles placed it under the Russian sceptre. The Baltic provinces—Esthonia, Livonia and Courland—ceased to form collectively one general government in 1876.

COURNOT—COURT, A.

COURNOT, ANTOINE AUGUSTIN (1801-1877). French economist and mathematician, was born at Gray (Haute-Saône) on the 28th of August 1801. Trained for the scholastic profession, he was appointed assistant professor at the Academy of Paris in 1831, professor of mathematics at Lyons in 1834, rector of the Academy of Grenoble in 1835, inspector-general of studies in 1838, rector of the Academy of Dijon and honorary inspector-general in 1854, retiring in 1862. He died in Paris on the 31st of March 1877. Cournot was the first who, with a competent knowledge of both subjects, endeavoured to apply mathematics to the treatment of economic questions. His *Recherches sur les principes mathématiques de la théorie des richesses* (English trans. by N. T. Bacon, with bibliography of mathematics of economics by Irving Fisher, 1897) was published in 1838. He mentions in it only one previous enterprise of the same kind (though there had in fact been others)—that, namely, of Nicholas François Canard (c.1750-1833), whose book, *Principes d'économie politique* (Paris, 1802), was crowned by the French Academy, though “its principles were radically false as well as erroneously applied.” Notwithstanding Cournot's just reputation as a writer on mathematics, the *Recherches* made little impression. The chief of their defects are that his results are in some cases of little importance, in others of questionable correctness, and that, in the abstractions to which he has recourse in order to facilitate his calculations, an essential part of the real conditions of the problem is sometimes omitted. His pages abound in symbols representing unknown functions, the form of the function being left to be ascertained by observation of facts, which he does not regard as a part of his task, or only some known properties of the undetermined function being used as bases for deduction. In his *Principes de la théorie des richesses* (1861) he abandoned the mathematical method, though advocating the use of mathematical symbols in economic discussions, as being of service in facilitating exposition. Other works of Cournot's were *Traité élémentaire de la théorie des fonctions et du calcul infinitésimal* (1841); *Exposition de la théorie des chances et des probabilités* (1843); *De l'origine et des limites de la correspondance entre l'algèbre et la géométrie* (1847); *Traité de l'encadrement des idées fondamentales dans les sciences et dans l'économie* (1861); and *Revue sommaire des doctrines économiques* (1877).

COURSING (from Lat. *cursus*, *currere*, to run), the hunting of game by dogs solely by sight and not by scent. From time to time the sport has been pursued by various nations against various animals, but the recognized method has generally been the coursing of the hare by greyhounds. Such sport is of great antiquity, and is fully described by Arrian in his *Cynegeticus* about a.d. 150, when the leading features appear to have been much the same as in the present day. Other Greek and Latin authors refer to the sport; but during the middle ages it was but little heard of. Apart from private coursing for the sake of filling the pot with game, public coursing has become an exhilarating sport. The private sportsman seldom possesses good strains of blood to breed his greyhounds from or has such opportunities of trying them as the public coursers.

The first known set of rules in England for determining the merits of a course were drawn up by Thomas, duke of Norfolk, in Queen Elizabeth's reign; but no open trials were heard of until half a century later, in the time of Charles I. The oldest regular coursing club of which any record exists is that of Swaffham, in Norfolk, which was founded by Lord Orford in 1766; and in 1780 the Ashdown Park (Berkshire) meeting was established. During the next seventy years many other large and influential societies sprang up throughout England and Scotland, the Altar Club (on the Sciton estates, near Liverpool) being founded in 1825. The season lasts about six months, beginning in the middle of September. It was not until 1858 that a coursing parliament, so to speak, was formed, and a universally accepted code of rules drawn up. In that year the National Coursing Club was founded. It is composed of representatives from all clubs in the United Kingdom of more than a year’s standing, and possessing more than twenty-four members. Their rules govern meetings, and their committee adjudicate on matters of dispute.

A comparative trial of two dogs, and not the capture of the game pursued, is the great distinctive trait of modern coursing. A greyhound stud-book was set up in 1888.

The breeding and training of a successful kennel is a precarious matter; and the most unaccountable ups and downs of fortune often occur in a coursers’ career. At a meeting an agreed-on even number of entries are made for each stake, and the ties drawn by lot. After the first round the winner of the first tie is opposed to the winner of the second, and so on until the last two dogs left in compete for victory; but the same owner’s greyhounds are “guarded” as far as it is possible to do so. A staff of beaters drive the hares out of their coverts or other hiding-places, whilst the slipper has the pair of dogs in hand, and slips them simultaneously by an arrangement of nooses, when they have both sighted a hare promising a good course. The judge accompanies on horseback, and the six points whereby he decides a course are—(1) speed; (2) the go-by, or when a greyhound starts a clear length behind his opponent, passes him in the straight run, and gets a clear length in front; (3) the turn, where the hare turns at not less than a right angle; (4) the apple, where the hare turns at a less than a right angle; (5) the kill; (6) the slip or the opportunity to kill a hare “no course,” as his verdict if the dogs have not fairly tried together, or an “undecided course” if he considers their merits equal. The open Waterloo meeting, held at Altcar every spring, —the name being taken from its being originated by the proprietor of the Waterloo Hotel, Liverpool,—is now the recognized fixture for the decision of the coursing championship, and the Waterloo Cup (1836) is the “Blue Riband” of the leas. In the United States, several British colonies, and other countries, the name has been adopted, and Waterloo Coursing Cups are found there as in England. In America an American Coursing Board controls the sport, the chief meetings being in North and South Dakota, Kansas, Nebraska, Iowa and Minnesota.

The chief works on coursing are—Arrian’s *Cynegeticus*, translated by the Rev. W. Dansey (1831); T. Thacker, *Coursier’s Companion and Breeder’s Guide* (1835); Thacker’s *Coursier’s Annual Remembrancer* (1849-1851); D. P. Blaine, *Encyclopaedia of Rural Sports* (3rd ed., 1870); and J. H. Walsh, *The Greyhound* (3rd ed., 1875). See also the *Coursing Journal* (since 1857); *Coursing and Falconry* (Badminton Library, 1892); *The Hare* (Fur and Feather series, 1896); and *The Greyhound Stud Book* (since 1882).

COURT, ANTOINE (1606-1760), French Protestant divine, was born in the village of Villeneuve-de-Berg, in the province of the Vivarais. He has been designated the “Restorer of Protestantism in France,” and was the organizer of the “Church of the Desert.” He was eight years old when the Camisard revolt was finally suppressed, and nineteen when on the 8th of March 1715 the edict of Louis XIV. was published, declaring that he “had abolished entirely the exercise of the so-called reformed religion” ("qu’il avait abolit toute exercice de la religion pretendue reformee"). Antoine, taken to the secret meetings of the persecuted Calvinists, began, when only seventeen, to speak and exhort in these congregations of the “desert.” He came to suspect after a time that many of the so-called “inspired” persons were “dupes of their own zeal and credulity,” and decided that it was necessary to organize at once the small communities of believers into properly constituted churches. To the execution of this vast undertaking he devoted his life. On the 21st of August 1715 he summoned all the preachers in the Cévennes and Lower Languedoc to a conference or synod near the village of Monoblet. Here elders were appointed, and the preaching of women, as well as pretended revelations, was condemned. The village of Monoblet “thus seems entitled to the honour of having had the first organized Protestant church after the revocation of the edict of Nantes” (H. M. Baird). But there were as yet no ordained pastors. Pierre Corteiz was therefore sent to seek ordination. He was ordained at Zurich, and from him Court himself received ordination. The scene of his labours for fifteen years was Languedoc, the Vivarais, and Dauphiné. His beginnings were very small prayer-meetings in the "desert." But the work progressed under his wise direction, and he was able “to be present, in 1744, at meetings of ten thousand souls.” In 1724 Louis XV., again
assuming that there were no Protestants in France, prohibited the most secret exercise of the Reformed religion, and imposed severe penalties. It was impossible fully to carry out this measure. But persecution raged, especially against the pastors. A price was set on the life of Court; and in 1730 he escaped to Lausanne. He had already, with the aid of some of the other Protestant princes, established a theological college ("Seminari de Lausanne") there, and during the remaining thirty years of his life he filled the post of director. He had the title of deputy-general of the churches, and was really the pillar of their hope. The Seminary of Lausanne sent forth all the pastors of the Reformed Church of France till the days of the first French Empire. Court formed the design of writing a history of Protestantism, and made large collections for the purpose, which have been preserved in the Public Library of Geneva; but this he did not live to carry out. He died at Lausanne in 1760. He wrote, amongst other works, a Histoire des troubles des Chretiens ou de la guerre des Camisards (1760). He was the father of the more generally known Antoine Court de Gebelin (q.v.).

COURT (from the O. Fr. court, Late Lat. curtis, curta, a popular form of class. Lat. cohors, gen. cohortis; the mod. Fr. form court is due to the influence of the Lat. curia, the word used in medieval documents to translate "court" in the feudal sense), a word originally denoting an enclosed place, and so surviving in its architectural sense (court-yard, &c.), but chiefly used as a general term for judicial tribunals and in the special sense of the household of the king, called "the court." All law courts were not, however, purely judicial in character; the old county court, for instance, was the assembly of the freeholders of the county in which representatives and certain officers were elected. Such assemblies in early times exercised political and legislative as well as judicial functions. But these have now been almost entirely separated everywhere, and only judicial bodies are now usually called courts. In every court, says Blackstone, there must be three parts,—an actor or plaintiff, reus or defendant, and judex, or judge.

The language of legal fictions, which English lawyers invariably use in all constitutional subjects, makes the king the ultimate source of all judicial authority, and assumes his personal presence in all the courts.

"As by our excellent constitution," says Blackstone, "the sole executive power of the laws is vested in the person of the king, it will follow that all courts of justice, which are the medium by which he administers the laws, are derived from the power of the crown. For whether created by act of parliament or letters patent, or by prescription (the only methods by which any court of judicature can exist), the king's court, and the two foregoing, are, in the latter impliedly given. In all these courts the king is supposed in contemplation of law to be always present; but as that is in fact impossible, he is then represented by his judges, whose power is only an emanation of the royal prerogative.

These words might give a false impression of the historical and legal relations of the courts and the crown, if it is not remembered that they are nothing more than the expression of a venerable fiction. The administration of justice was, indeed, one of the functions of the kingship, and it continued to be so so late as the reign of Edward IV.; and even after regular tribunals were established, a reserve of judicial power still remained in the king and his council, in the exercise of which it was possible for the king to participate personally. The last judicial act of an English king, if such it can be called, was that by which James I. settled the dispute between the court of chancery and courts of common law. Since the establishment of parliamentary government the courts take their law directly from the legislature, and the king is only connected with them directly as a member of the legislative body. The king's name, however, is still used in this as in other departments of state action. The courts exercising jurisdiction in England are divided by certain features which may here be briefly indicated.

We may distinguish between (1) superior and inferior courts. The former are the courts of common law and the court of chancery, now High Court of Justice. The latter are the local or district courts, county courts, &c. (2) Courts of record and courts not of record. "A court of record is one whereof the acts and judicial proceedings are enrolled for a perpetual memory and testimony, which rolls are called the records of the court, and are of such high and supereminent authority that their truth is not to be called in question. For it is a settled rule and maxim that nothing shall be averred against a record, nor shall any plea or even proof be admitted to the contrary. And if the existence of the record shall be denied it shall be tried by nothing but itself; that is, upon bare inspection whether there be any such record or no; else there would be no end of disputes. All courts of record are the courts of the sovereign in right of the crown and royal dignity, and therefore any court of record has authority to fine and imprison for contempt of its authority" (Stephen's Blackstone). (3) Courts may also be distinguished as civil or criminal. (4) For each jurisdiction is to be made a court of first instance and courts of appeal. In the former the first hearing in any judicial proceeding takes place; in the latter the judgment of the first court is brought under review. Of the superior courts, the High Court of Justice in its various divisions is a court of first instance. Over it is the court of appeal, and over that again the House of Lords. The High Court of Justice is (through divisional courts) a court of appeal for inferior courts. (5) There is a special class of local courts, which do not appear to fall within the description of either superior or inferior courts. Some, while administering the ordinary municipal law, have or had jurisdiction exclusive of their superior courts; such were the common pleas of Durham and Lancaster. Others have concurrent jurisdiction with the superior courts; such are the lord mayor's court of London, the passage court of Liverpool, &c.

The distribution of judicial business among the various courts of law in England may be exhibited as follows.

Criminal Courts.—(1) The lowest is that of the justice of the peace, sitting in petty sessions of two or more, to determine in a summary way certain specified minor offences. In populous districts, such as London, &c., stipendiary magistrates are appointed, generally with escort. Moreover, besides punishing by summary conviction, justices may commit prisoners for trial at the assizes. (2) The justices in quarter sessions are commissioned to determine felonies and other offences. An act of 1842 (5 & 6 Vict. c. 38) contains a list of offences not triable at quarter sessions—treason, murder, forgery, bigamy, &c. (see Quarter Sessions, Court of). The corresponding court in a borough is presided over by a recorder. (3) The more serious offences are reserved for the judges of the superior courts sitting under a commission of oyer and terminer or gaol delivery for each county. The assize courts, as they are called, sit in general in each county twice a year, following the division of circuits; but additional assizes are also held under acts of 1876 and 1877, which permit several counties to be united together for that purpose (see Circuit). London, which occupies an exceptional position in all matters of judicature, has a high criminal court of its own, established by the Central Criminal Court Act 1834, under the name of the central criminal court. Its judges usually proceed to circuit by lot, from the superior judges of common law, the recorder, or common serjeant, and the judge of the City of London court. (4) The criminal appeal courts, to which all persons convicted on indictment may appeal, superseded in 1908 (by the Criminal Appeal Act 1907) the court for crown cases reserved, to which any question of law arising on the trial of a prisoner

2 The sittings are held in the court-house in the Old Bailey. The old sessions house was destroyed in the Gordon riots of 1780. The building erected in its place, although enlarged from time to time, was very incommodious, and a new structure, occupying the site of Newgate Prison, which was pulled down for the purpose, was completed in 1907.
COURT

323
could after conviction be remitted by the judge in his discretion.  

To the criminal appeal court there is an appeal both on questions of fact and of law (see APPEAL).

Civil Courts.—In certain special cases, civil claims of small importance may be brought before justices or stipendiaries.  

Otherwise, and excepting the special and peculiar jurisdictions above mentioned, the civil business of England and Wales may be said to be divided between the county courts (taking small cases) and the High Court of Justice (taking all others).

The effect of the Judicature Acts on the constitution of the superior courts may be briefly stated.  There is now one Supreme Court of Judicature, consisting of two permanent divisions called the High Court of Justice and the court of appeal.  

The former takes the jurisdiction of the court of chancery, the three common law courts, the courts of admiralty, probate, and divorce, the courts of pleas at Lancaster and Durham, and the courts created by commissions of assize, oyer and terminer, and gaol delivery.  

The latter takes the jurisdiction of the court of appeal in chancery (including chancery of Lancaster), the court of the lord warden of the stannaries, and of the exchequer chamber, and the appellate jurisdiction in admiralty and haremy matters of the judicial committee; and power is given to the sovereign to transfer the remaining jurisdiction of that court to the court of appeal.

By the Appellate Jurisdiction Act of 1876 the House of Lords is enabled to sit for the hearing of appeals from the English court of appeal and the Scottish and Irish courts during the prorogation and dissolution of parliament.  

The lords of appeal, of whom three must be present, are the lord chancellor, the lords of appeal in ordinary, and peers who have held "high judicial office" in Great Britain or Ireland.  

The lords in ordinary are an innovation in the constitution of the House.  

They hold the rank of baron for life only, have a right to sit and vote in the House during tenure of office only, and a salary of £6000 per annum.

There are also many obsolete or decayed courts, of which the most noticeable are dealt with under their individual headings, as COURT BARON, COURT LEET, &c.

The history of English courts affords a remarkable illustration of the continuity that characterizes English institutions.  

It might perhaps be too much to say that all the courts now sitting in England may be traced back to a common origin, but at any rate the higher courts are all offshoots from the same original judicature.  

Leaving out of account the local courts, we find the higher jurisdiction after the Norman Conquest concentrated along with all other public functions in the king and council.  

The first sign of a separation of the judicial from the other powers of this body is found in the recognition of a Curia Regis, which may be described as the king's council, or a portion of it, charged specially with the management of judicial and revenue business.  

In relation to the revenue it became the exchequer, under which name a separate court grew up whose special field was the judicial business arising out of revenue cases.  

By Magna Carta the inconvenience caused by the curia following the king's person was remedied, in so far as private litigation was concerned, by the order that common pleas (Communia Placita) should be held at the same fixed place; and hence arose the court of common pleas.  

The Curia Regis, after having thrown off these branches, is represented by the king's bench, so that from the same stock we have now three courts, differing at first in functions, but through competition for business, and the ingenious use of fictions, becoming finally the co-ordinate courts of common law of later history.  

But an inner circle of counsellors still surrounded the king, and in his name claimed to exercise judicial as well as other power; hence the chancellor's jurisdiction, which became, partly in harmony with the supra-legal power claimed from which it sprang, and partly through the influence of the ecclesiastical chancellors by whom it was first administered, the equity of English law.  

Similar developments of the same authority were the court of requests (which was destroyed by a decision of the common pleas) and the court of star chamber—a court of criminal equity, as it has been called,—which, having been made the instrument of tyranny, was abolished in 1641.  

Even then the productive power of the council was not exhausted; the judicial committee of the privy council, established in 1832, superseding the previous court of delegates, exercises the jurisdiction in appeal belonging to the king in council.  

The appellate jurisdiction of the Lords rests on their claim to be the representatives of the ancient great council of the realm.

See further ADMIRALTY, HIGH COURT OF; APPEAL; CHANCERY; COMMON LAW; COMMON Pleas, COURT OF; Divorce; Equity; &c.

United States.—The Federal judicial system of the United States is made by the Constitution independent both of the Legislature and of the Executive. It consists of the Supreme Court, the circuit courts, and the district courts.

The Supreme Court is created by the Constitution, and consisted in 1909 of nine judges, who are nominated by the President and confirmed by the Senate.  

They hold office during good behaviour, i.e. are removable only by impeachment, thus having a tenure even more secure than that of English judges.  

The court sits at Washington from October to July in every year.  

The sessions of the court are held in the Capitol. A rule requiring the presence of six judges to pronounce a decision prevents the division of the court into two or more benches; and while this secures a thorough consideration of every case, it also retards the dispatch of business.  

Every case is discussed twice by the whole body, once to ascertain the view of the majority, which is then directed to be set forth in a written opinion; then again, when the written opinion, prepared by one of the judges, is submitted for criticism and adoption by the court as its judgment.

The other Federal courts have been created by Congress under a power in the Constitution to establish "inferior courts."  

The circuit courts consist of twenty-nine circuit judges, acting in nine judicial circuits, while to each circuit there is also allotted one of the justices of the Supreme Court.  

Circuit courts of appeals, established to relieve the Supreme Court, consist of three judges (two forming a quorum), and are made up of the circuit and district judges of each circuit and the Supreme Court justice assigned to the circuit.  

Some cases may, however, be appealed to the Supreme Court from the circuit court of appeals, and not directly from the lower courts.  

The district courts number (1909) ninety, in most cases having a single judge.  

There is also a special tribunal called the court of claims, which deals with the claims of private persons against the Federal government.  

It is not strictly a part of the general judicial system, but is a creation of Congress designed to relieve that body of a part of its own labours.

The jurisdiction of the Federal courts extends only to those cases in which the Constitution makes Federal law applicable.  

All other cases are left to the state courts, from which there is no appeal to the Federal courts, unless where some specific point arises which is affected by the Federal Constitution or a Federal law.  

The classes of cases dealt with by the Federal courts are as follows:—

1. Cases in law and equity arising under the Constitution, the laws of the United States, and treaties made under their authority;

2. Cases affecting ambassadors, other public ministers and consuls;

3. Cases of admiralty and maritime jurisdiction;

4. Controversies to which the United States shall be a party;

5. Controversies between two or more states, between a state and citizens of another state, between citizens of different states, between citizens of the same state claiming lands under grants of different states, and between a state or the citizens thereof and foreign states, citizens or subjects (Const., Art. III., § 2).  

Part of this jurisdiction has, however, been withdrawn by the eleventh Amendment to the Constitution, which declares that "the judicial power of the United States shall not be construed to extend to any suit commenced or prosecuted against one of the United States by citizens of another state, or by citizens or subjects of any foreign state."

The jurisdiction of the Supreme Court is original in cases affecting ambassadors, and wherever a state is a party; in other cases it is appellate.  

In some matters the jurisdiction of the
Federal courts is exclusive; in others it is concurrent with that of the state courts.

As it frequently happens that cases come before state courts in which questions of Federal law arise, a provision has been made whereby due respect for the latter is secured by giving the party to a suit who relies upon Federal law, and whose contention is overruled by a state court, the right of having the suit removed to a Federal court. The Judiciary Act of 1789 (as amended by subsequent legislation) provides for the removal to the Supreme Court of the United States of a "final judgment or decree in any suit rendered in the highest court of a state in which a decision could be had, where is drawn in question the validity of a treaty or statute of, or an authority exercised under the United States, and the decision is against their validity; or where is drawn in question the validity of a statute of, or an authority exercised under, any state, on the ground of their being repugnant to the Constitution, treaties or laws of the United States, and the decision is against their validity; or where is drawn in question the validity of a statute of, or an authority exercised under, any state, on the ground of their being repugnant to the Constitution, treaty, statute, commission or authority." If the decision of the state court is in favor of the right claimed under Federal law or against the validity or applicability of the state law set up, there is no ground for removal, because the applicability or authority of Federal law in the particular case could receive no further protection from a Federal court than has in fact been given by the state court.

The power exercised by the Supreme Court in declaring statutes of Congress or of state legislatures (or acts of the Executive) to be invalid because inconsistent with the Federal Constitution, has been deemed by many Europeans a peculiar and striking feature of the American system. There is, however, not a little unreasoning and mysterious about it. As the Federal Constitution, which emanates directly from the people, is the supreme law of the land everywhere, any statute passed by any lower authority (whether the Federal Congress or a state legislature), which contravenes the Constitution, must necessarily be invalid in point of law, just as in the United Kingdom a railway by-law which contravened an act of parliament would be invalid. Now, the functions of judicial tribunals—of all courts alike, whether Federal or state, whether superior or inferior—is to interpret the law, and if any tribunal finds a Congressional statute or state statute inconsistent with the Constitution, the tribunal is obliged to hold such statute invalid. A tribunal does this not because it has any right or power of its own in the matter, but because the people have, in enacting the Constitution as a supreme law, declared that all other laws inconsistent with it are ipso jure void. When a tribunal has ascertained that an inferior law is thus declared by the Federal Constitution, it宣告s it void. The tribunal does not enter any conflict with the Legislature or Executive. All it does is to declare that a conflict exists between two laws of different degrees of authority, whence it necessarily follows that the weaker law is est or ecl. This duty of interpretation belongs to all tribunals, but as constitutional cases arc, if originating in a lower court, usually carried by appeal to the Supreme Court, men have grown accustomed to talk of the Supreme Court as in a special sense the guardian of the Constitution.

The Federal courts never deliver an opinion on any constitutional question unless or until that question is brought before them in the form of a lawsuit. A judgment of the Supreme Court is only a judgment on the particular case before it, and does not prevent a similar question being raised again in another lawsuit, though of course this seldom happens, because it may be assumed that the court will adhere to its former opinion. There have, however, been instances in which the court has virtually changed its view on a constitutional question, and it is understood to be entitled so to do.

COURT BARON, an English manorial court dating from the middle ages and still in existence. It was laid down by Coke that a manor had two courts, "the first by the common law, and called a court baron," the freeholders ("barons") being its suitors; the other a customary court for the copyholders. Stubb's adopted this explanation, but the latest learning, expounded by Professor Maitland, holds that court baron means curia baronis, "la court de seigneur," and that there is no evidence for there being more than one court. The old view that at least two freeholders were required for its composition is also now discarded. Prof. Maitland's conclusion is that the "court baron" was not even differentiated from the "court-leet" at the close of the 13th century, but that there was a distinction of jurisdictional rights, some courts having only feudal rights, while others had realties as well. When the court-leet was differentiated, the court baron remained with feudal rights alone. These rights he was disposed to trace to a lord's jurisdiction over his men rather than to his possession of the manor, although in practice, from an early date, the court was associated with the manor. Its chief business was to administer the "custom of the manor" and to admit fresh tenants who had acquired copyholds by inheritance or purchase, and had to pay, on so doing, "a fine" to the lord of the manor. It is mainly for the latter purpose that the court is now kept. It is normally presided over by the steward of the lord of the manor, who is a lawyer, and its proceedings are recorded on "the court rolls," of which the older ones are now valuable for genealogical as well as for legal purposes.

See Select Pleas in Manorial and other Seigniorial Courts, vol. i., and The Court Barons (Selden Society).

COURT DE GEBELIN, ANTOINE (1728–1784), French scholar, son of Antoine Court (q.v.), was born at Nimes in 1728. He received a good education, and became, like his father, a pastor of the Reformed Church. This office, however, he soon relinquished, to devote himself entirely to literary work. He had conceived the project of a work which should set in a new light the phenomena, especially the languages and mythologies, of the East, and had been preparing a "Dictionary of the Oriental Languages" in order to be near the necessary books. After long years of research, he published in 1777 the first volume of his vast undertaking under the title of Le Monde primitif, analysé et comparé avec le monde moderne. The ninth volume appeared in 1784, leaving the work still unfinished. The literary world marvelled at the encyclopaedic learning displayed by the author, and supposed that the French Academy, or some other society of scholars, must have combined their powers in its production. Now, however, the world has well-nigh forgotten the huge quartos. These learned labours did not prevent Gebelin from pleasing earnestly the cause of religious tolerance. In 1760 he published a work entitled Les Toussoisines, advocating the rights of the Protestants; and he afterwards established at Paris an agency for collecting information as to their sufferings, and for exciting general interest in their cause. He co-operated with Franklin and others in a periodical entitled Affaires de l'Ame, which was devoted to the support of American independence. He was also a supporter of the principles of the economists, and Quesnay called him his well-beloved disciple. In the last year of his life he became acquainted with Mesmer, and published a Lettre sur le magnétisme animal. He was imposed upon by speculators in whom he placed confidence, and was reduced to destitution by the failure of a scheme in which they engaged him. He died at Paris on the 10th of May 1784.

See La France protestante, by the brothers Haag, tome iv.; Charles Dardier, Court de Gebelin (Nimes, 1890).

COURTENAY, the name of a famous English family. English genealogists head the pedigree of this family with one Athon or Athos, who is said to have fortified Courtenay in Gâtinois about the year 1030. His son Joselin had, with other issue, Miles, lord of Courtenay, founder of the Cistercian abbey of Fontaine-Jaumet. By his wife Ermengarde, daughter of Renaud, count of Nevers, Miles left a son Renaud, one of the magnates who followed Louis le Jeune to the Holy Land. This was the last lord of Courtenay of the line of Athon. Elizabeth, his elder daughter—a younger daughter died without issue, —carried Courtenay
other lordships to her husband Pierre, seventh and youngest son of the French king Louis VI. the Fat, the marriage taking place about 1150, and the many descendants of this royal match bore the surname of Courtenay.

Pierre, the eldest son, was founder of a short-lived dynasty of emperors of Constantinople, which ended in 1261 when Baldwin (Baudouin), last of the Frankish emperors, died before Michael Palaeologus from a capital in flames. Baldwin's son Philip, however, bore the empty title, and his granddaughter Catherine, wife of Charles, count of Valois, was titular emperor. Other successors of the royal Courtenays, sprung from Pierre of France, were lords of Champignelles, Tanlay, Yerre, Bleneau, La Ferret Loupière and Chevillon. On the death of Gaspard, sieur de Bleneau, in 1655, his cousin Louis de Courtenay, comte de Cési (jure uxoris) and sieur de Chevillon, had Bleneau, and reckoned himself the surviving chief of his house. He styled himself Prince de Courtenay and his family made attempts to obtain recognition for their royal blood. But their laboriously constructed genealogies availed nothing to this impoverished race. The last "Prince de Courtenay," an ex-captain of dragoons, died in 1730; his uncle Roger de Courtenay, abbé des Eschalis, who died in 1735, was the last recognized member of the line of Pierre of France.

A younger branch of the first house of Courtenay came from Joscelin, second son of Josselin, son of Athis. This Josselin, a notable crusader, went to the Holy Land with the count of Blois, and held by the sword for eleven years the county of Edessa, given him by his cousin King Baldwin II. Edessa was won back by the infidel from his son Josselin, who died a prisoner in Aleppo in 1147. A grandson, also a Josselin, was seneschal of the kingdom of Jerusalem.

In England a house of Courtenay has flourished with varying fortunes since the reign of the first Angevin king. The monks of Ford, to whom they were benefactors, complacently set down their patrons as the offspring of the royal Courtenay, of whose origin they had some dim knowledge, deriving them from "Florus," son of Louis the Fat. A comparison of dates destroys the story. But they were, doubtless, Courtenays of the stock of Athis. Josselin, the first count of Edessa, has been suggested by modern writers as their founder, but the name Reinaud, borne by the first known ancestor of the English house, suggests that they may have sprung from a younger son of Josselin I. of Courtenay, by his marriage about 1095 with Ermengarde, daughter of Reinaud, count of Nevers. It is also notable that the English Courtenays have, from the first introduction of armorial bearings, borne with various differences the three red roundels in a golden field, the arms of the Courtenays in France, the shield of the earls of Devone being identical with that of the lords of La Ferté Loupière.

Several Courtenays whose kinship cannot be exactly ascertained, appear in English records of the 12th century. One of them, Robert de Courtenay, married the daughter and heir of Reynold fitz Urse, the leader of the murderers of Archbishop Thomas Becket. His son, William, a Shropshire baron, held the castle of Montgomery, as heir by his mother of Baldwin de Bursley, or Bollers, to whom Henry I. had given it with his "niece" Sibil de Falaise. This William married Ada of Dunbar, daughter of Patrick, earl of Dunbar, but died in the reign of King John, without issue.

Reinaud de Courtenay, ancestor of the main English line, may well have been a brother of the Robert above named. The English pedigrees confuse him with his son of the same name. He was a favourite with Henry II., his attestations of charters showing him as a constant companion at home and abroad of the king, whom he followed to Wexford in the Irish expedition of 1172. Henry gave him Berkshire lands at Sutton, still known as Sutton Courtenay, by a charter to which the date of 1161 can be assigned. In England he had to wife Maude, daughter of Robert fitz Roy by Maude of Avranches, the elder Maude being the heir of the house of Brionne. By her, who survived him, dying before January 1224, he had no issue, but by a wife who may have died before his coming to England he had, with other issue, Robert and Reinaud. Robert, who succeeded to Sutton about 1190, was husband of Alice de Rumilly, widow of Gilbert Pipard, and one of the three sisters and co-heirs of William, the boy of Egremond, of whose drowning in the Strid Wordsworth has made a ballad. Robert died childless in 1200. Of his brother Reinaud or Reynold de Courtenay little is known, save that he was a married man in 1178 when he and his wife Alice were given by the pope a licence to have a free chapel at Okehampton. This father, Hawise de Ayencourt, was, with Maude his father's second wife, a daughter and co-heir of Maude of Avranches, her father being the lord of Ayencourt, first husband of the late named Maude. Her great inheritance included the honour of Okehampton in Devonshire of which, as a widow, she had livery about 1205.

Her son, Robert de Courtenay, succeeded to her land in 1219, having been his uncle Robert's heir in Sutton ten years before. Like his father he advanced his house by a great marriage, his wife being Mary, the younger daughter of William de Vernon, earl of Devon and of the Isle of Wight. He was succeeded in 1242 by his son John, who by Isabel, a daughter of Hugh de Vere, earl of Oxford, has issue Hugh, whose wife was Eleanor, daughter of the earl of Winchester, elder of the two females of Edward II. The son of this marriage, another Hugh, followed his father at the siege of White. Two years later died Isabel, surviving sister and heir of Baldwin de Reviers, earl of Devon, and widow of William de Forz, last earl of Aumerle (Albemarle). On her death-bed she had granted her lordship of the Wight to the king, but her cousin Hugh de Courtenay succeeded her in the unalienated estates of the house of Reviers. He was summoned as a baron on the 6th of February 1298/9, and in 1300 he displayed his banner before the castle of Caerlaverock. Claiming the "third penny" of the county of Devon, he was refused by the exchequer as he did not claim in the name of an earl. Following, however, a writ of inquiry, a patent of the 22nd of February 1334/5 declared him earl of Devon and qualified to take such style as his ancestors, earls of Devon, were wont to take. Hugh, his son, the second earl, a warrior who drove the French back from their descent on Cornwall in 1339, made another of the brilliant marriages of this family, his wife being Eleanor, daughter of Humphrey de Bohun, earl of Hereford and Essex, Elizabeth daughter of Edward I. Their eldest son, Sir Hugh de Courtenay, shared in the honours of Crécy and Poitiers, and was one of the knights of the order of the Garter, the stall-plate of his arms being still in George's chapel at Windsor. This knight died in the lifetime of the earl, as did his only son Hugh, summoned as a baron on the 3rd of January 1370/1, a companion at Najara of the Black Prince, whose step-daughter Maude of Holland he had married. The earl was therefore succeeded by his grandson Edward (son of Edward his third son), earl marshal of England in 1385, who died blind in 1410, the year after the death of Sir Edward his heir apparent, one of the conquerors at Agincourt. Hugh, a second son of Earl Edward, succeeded as fourth earl of the Courtenay line. By his wife, a sister of the renowned Talbot, earl of Shrewsbury, he had issue Thomas the fifth earl, a partizan of Henry VI., whose wife was Margaret Beaufort, daughter of John, earl of Somerset. The effigy of this granddaughter of John of Gaunt, with the shields of Courtenay and Beaufort above it, is in Colyton church. It is less than life size, a fact which has given rise to a legend that it represents "Little chok-e-a-bone," an infant daughter of the tenth earl, who died "choked by a fish bone." One of the shields of the shields and the 15th century dress of the effigy has been strengthened by an inscription upon a brass plate, and in the year 1553 the monument engaged a memorial sculptor to deface the effigy by giving its broken features the newly carved face of a young child. Both sons of this marriage fell in the Wars of the Roses, Thomas the sixth earl being taken at Towton by the Yorkists and beheaded at York in 1462, his younger brother Henry having the same fate at Salisbury in 1466.

The earldom being extinguished by attainder, Sir Humphrey Stafford was created earl of Devon in 1469, but in the same year, having retired with his men from the expedition against
Robin of Redesdale, another earl of Devon suffered at the headman's hands, his patent being afterwards annulled by a statute of Henry VII. On the restoration of Henry VI. John Courtenay, only surviving brother of Thomas and Henry, was restored to the earldom by the reversal of attainer. He, too, died in the Lancastrian cause, being killed on the 4th of May 1471 at Tewkesbury, where he led the rear of the host. The representation of the Reviers earls and of the Courtenay barony fell then to his sisters and their descendants. Besides him at Tewkesbury died his cousin Sir Hugh Courtenay of Boscrono, son of Hugh, a younger brother of the blind earl, leaving a son Edward, who thus became the heir male of the house though not its heir general. Joining in the cause which had cost so many of his kinsmen their lives, he and his brother Walter shared the duke of Buckingham's rising. On its failure they fled into France to the earl of Richmond, beside whom Sir Edward fought at Bosworth. By a patent of the 26th of October 1485 he was created earl of Devon with remainder to the heirs male of his body, and by an act of 1485 he was restored to all honours lost in his attainder by the Yorkist parliament. He defended Exeter against Warbeck's rebels and was a knight of the Garter in 1489, dying twenty years later, when the earldom became again forfeit by his son's attainder. That son, William Courtenay, had drawn the jealousy of Henry VII. by a marriage with Catherine, sister of the queen and daughter of King Edward IV., the Yorkist sovereign whose hand had been so heavy on the Courtenays. After the queen's death, Henry sent his wife's brother-in-law to the Tower on a charge of corresponding with Edmund Pole, an attainer following. But on the accession of Henry VIII., the young king released his uncle, who although styled an earl was not fully restored in blood at his death in 1511. His son Henry Courtenay obtained from parliament in December 1512 a reversal of his father's attainder, thus succeeding to the earldom of his grandfather. At the Field of Cloth of Gold he ran a course with the king of France. He was knight of the Garter and on the 15th of June 1525 had a patent as marquess of Exeter. Profiting by the suppression of the monasteries he increased his estate, his power being all but supreme in the west country. But Cromwell was his heir, and the royal strain in his blood was a dangerous thing. Involved in correspondence with Cardinal Pole, he was sent to the Tower with his wife and his young son, and on the 6th of December 1538 he was beheaded as a traitor. The misfortunes of the house were heavy upon the son, who at twenty years old was a prisoner for the sake of his high descent. His honours had been forfeited, and release did not come until the accession of Queen Mary, who took him into favour. Noailles the ambassador found him le plus beau et le plus agréable gentilhomme d'Angleterre, and he had some hopes of becoming king consort. The queen created him earl of Devonshire by a patent of the 3rd of September 1553 and in the next month he was restored in blood. But, disappointed in his hopes, he formed some wild plans for marrying the Lady Elizabeth and making her queen. He could raise Devon and Cornwall. Wyatt did raise Kent, but the plot was soon crushed. The earl was sent back to the Tower and thence to Fotheringhay. At the 10th of May 1556 he was released on parole and died dying suddenly at Padua in 1556. His co-heirs were the descendants of the four sisters of Earl Edward (d. 1510), the wives of four Cornish squires, and with him was extinguished, to the belief of all men, the Courtenays' earldom of Devon. His heir male was Sir William Courtenay, his sixth cousin once removed, head of a knightly line of Courtenays whose seat was Powderham Castle, a line which, during the civil wars, stood for the White Rose. Sir William, who is said to have been killed at St Quintin in 1557, was succeeded by his son, another Sir William, one of the under-takers for the settling of Ireland, where the family obtained great estates. William Courtenay of Powderham, of whose marriage with the daughter of Sir William Waller (the parliament's general) it is remarked that the years of bride and bridegroom added together were less than thirty when their first child was born, was created a baronet by writ of privy seal in February 1644, the patent being never enrolled. His great grand-sire, Sir William Courtenay, many years a member of parliament, was on the 6th of May 1762, ten days before his death, created Viscount Courtenay of Powderham Castle.

Since the death at Padua in 1556 of Edward, earl of Devon, that ancient title had been twice revived. Charles Blount, Lord Mountjoy, who was created earl of Devon in 1603, died without lawful issue in 1606. In 1618 Sir William Cavendish, son of the famous Bess of Hardwick, was given the same title, which is still among the peerage honours of the ducal house descending from him. For the Courtenays, who had without protest accepted a baronetcy and a viscountcy, their earldom was dead. In the reign of William IV., the third and last Viscount Courtenay was living unmarried in Paris, an exile who for sufficient reasons was keeping out of the reach of the English criminal law. In the name of this man, his presumptive heir male, William Courtenay, clerk assistant of the parliament, succeeded in persuading the House of Lords that the Courtenay earldom under the patent of 1553 was still in existence, the plea being that the terms of the remainder—to him and his heirs male for ever—did not limit the succession to heirs male of the body of the grantee. Five other cases wherein the words de corum suo had been omitted from the patent are known to peerage lawyers. In no case had a peerage before been claimed by collateral heirs male. "I have often rallied Brougham," writes Lord Campbell, "upon his creating William Courtenay earl of Devon. He says he consulted Chief Justice Tenterden. But Tenterden knew nothing of peerage law." After the death of the exile in 1835 the clerk of the parliament succeeded him as an earl by force of the House of Lords decision of the 15th of March 1831. His second son, the Rev. Henry Hugh Courtenay (1811-1904), succeeded, as 13th earl, a nephew whose extravagance had impoverished the estates. He in turn was followed, as 14th earl, by his grandson Charles Pepys Courtenay (b. 1870).

No other recognized branch of this house, once so widely spread in the western counties, is now among the landed houses of England. Among its cadets were many famous warriors, but three prelates must be reckoned as the most eminent of the Courtenays. William, a younger son of the match of Courtenay and Butler, was bishop of Hereford in 1370, bishop of London in 1375 and archbishop of Canterbury in 1381. Proceeding against Wycliffe he opposed John of Gaunt, who, taunting him with his trust in his great kinsfolk, threatened to drag him out of St Paul's by his hair, a threat which roused the angry Londoners in his defence. He died in 1396 and lies buried at the feet of the Black Prince in his cathedral of Canterbury. By his will he left his best mire to his nephew Richard Courtenay—son and pupil, as he styles him—against the time he should be a bishop. This Richard, a friend of Henry V. when prince, and treasurer of his household, was bishop of Norwich in 1413. Twice chancellor of Oxford, he repelled Archbishop Arundel and all his train when that primate would have had a visitation of the university, although the claim of the university to independence was at last broken down. Tall of stature, eloquent and learned, he kept the favour of the king, who was with him when he died of dysentery in the host before Harfleur. Heir of this bishop was his nephew Sir Philip of Powderham, whose younger son Peter Courtenay was the third of the Courtenay prelates, being bishop of Exeter from 1478 to 1487, when he was translated to Winchester. Although of the Yorkist Courtenays, he was of Buckingham's party and, being attainted by Richard III. for joining with certain of his kinsfolk in an attempt to raise the west, he escaped to Brittany, whence he returned with the first Tudor sovereign, who had him in high favour. A fourth prelate of this family was Henry Reginald Courtenay, who was bishop of Bristol 1704-1709 and bishop of Exeter from 1709 to his death in 1803. See charter, patent, close, fine and plea rolls, inquests post mortem & other records, G. E. C.'s Complete Peerage; Dictionary of National Biography; Burke's Peerage, and W. Farrer and B. Page, Round's Peerage Studies; Calendars of State Papers; Machyn's Diary (Camer: Society); Chronicles of Capgrave, Wavrin, Adam of Usk, etc. (O. B.A.)

COURTENAY, RICHARD (d. 1413), English prelate, was a son of Sir Philip Courtenay of Powderham Castle, near Exeter, and a grandson of Hugh Courtenay, earl of Devon (d. 1377). He
was a nephew of William Courtenay, archbishop of Canterbury, and a descendant of Edward I. Educated at Exeter College, Oxford, he entered the church, where his advance was rapid. He held several prebends, was dean of St Asaph and then dean of Wells, and became bishop of Norwich in 1411. As chancellor of the university of Oxford, an office to which he was elected in 1407 and again in 1410, Courtenay asserted the independence of the university against Thomas Arundel, archbishop of Canterbury, in 1411; but the archbishop, supported by Henry IV. and Pope John XXIII., eventually triumphed. Courtenay was a personal friend of Henry V. both before and after he came to the throne; and in 1413, immediately after Henry's accession, he was made treasurer of the royal household. On two occasions he went on diplomatic errands to France, and he was also employed by Henry on public business at home. Having accompanied the king to Harfleur in August 1415, Courtenay was attacked by dysentery and died on the 15th of September 1415, his body being buried in Westminster Abbey.

Another member of this family, Peter Courtenay (d. 1492), a grandnephew of Richard, also attained high position in the English Church. Educated at Exeter College, Oxford, Peter became dean of Windsor, then dean of Exeter; in 1478 bishop of Exeter; and in 1487 bishop of Winchester in succession to William of Waynflete. With Henry Stafford, duke of Buckingham, and others he attempted to raise a rebellion against Richard III. in 1483, and fled to Brittany when this enterprise failed. Courtenay was restored to his dignities and estates in 1485 by Henry VII., whom he had accompanied to England, and he died on the 23rd of September 1492.

Courtenay, William (c. 1342–1396), English prelate, was a younger son of Hugh Courtenay, earl of Devon (d. 1377), and through his mother Margaret, daughter of Humphrey Bohun, earl of Hereford, was a great-grandson of Edward I. Being a native of the west of England he was educated at Stapleford Hall, Oxford, and after graduating in law was chosen chancellor of the university in 1367. Courtenay's ecclesiastical and political career began about the same time. Having been made prebendary of Exeter, of Wells and of York, he was consecrated bishop of Hereford in 1370, was translated to the see of London in 1375, and became archbishop of Canterbury in 1381, succeeding Simon of Sudbury in both these latter positions. As a politician the period of his activity coincides with the years of Edward III.'s dotage, and with practically the whole of Richard II.'s reign. From the first he staked himself among the opponents of John of Gaunt, duke of Lancaster; he was a firm upholder of the rights of the English Church, and was always eager to root out Lollardy. In 1373 he declared in convocation that he would not contribute to a subsidy until the evils from which the church suffered were removed; in 1375 he incurred the displeasure of the king by publishing a papal bull against the florinetics; and in 1377 his decided action during the quarrel between John of Gaunt and William of Wykeham ended in a temporary triumph for the bishop. Wycliffe was another cause of difference between Lancaster and Courtenay. In 1377 the reformer appeared before Archbishop Sudbury and Courtenay, when an altercation between the duke and the bishop led to the dispersal of the court, and during the ensuing riot Lancaster probably owed his safety to the good offices of his foe. Having meanwhile become archbishop of Canterbury Courtenay summoned a council, or synod, in London, which condemned the opinions of Wycliffe; he then attacked the Lollards at Oxford, and urged the bishops to imprison heretics. He was for a short time chancellor of England during 1381, and in January 1382 he officiated at the marriage of Richard II. with Anne of Bohemia, afterwards crowning the queen. In 1385 he accompanied the bishop of Winchester to South Wales, to meet the claims of the bishop of Exeter and Salisbury, and Courtenay was only partially able to enforce the payment of a special tax to meet his expenses on this occasion. During his concluding years the archbishop appears to have upheld the papal authority in England, although not to the injury of the English Church.

He protested against the confirmation of the statute of provisors in 1390, and he was successful in slightly modifying the statute of praemunire in 1393. Disliking the extravagance of Richard II. he publicly reproved the king, and after an angry scene the royal threats drove him for a time into Devonshire. In 1390 he was one of the commissioners appointed to reform the kingdom and the royal household, and in 1392 he arranged a peace between Richard and his enemies under Thomas of Woodstock, duke of Gloucester. Courtenay died at Maidstone on the 31st of July 1396, and was buried in Canterbury cathedral.

Courtesé (O. Fr. curtesie, later courtoisie), manners or behaviour that suit a court, politeness, due consideration for others. A special application of the word is in the expression “by courtesé,” where something is granted out of favour and not of right, hence “courtesé” titles, i.e. those titles of rank which are given by custom to the eldest sons of dukes, marquesses and earls, usually the second title held by the father; to the younger sons and to the daughters of dukes and marquesses, viz. “the lady” and “the lady’s son.” For “courtesé” see COURTESY. Another form of the word, “courtesey” or “curtsey,” was early confined to the expression of courtesy or respect by a gesture or bow, now only of the reverence made by a woman, consisting in a bending of the knees accompanied by a lowering of the body.

CourthoPé, Wiliam John (1842–1929), English writer and historian of poetry, whose father was rector of South Malling, Essex, was born on the 17th of July 1842. From Harrow school he went to New College, Oxford; took first-classes in classical “moderations” and “greats”; and won the Newdigate prize for poetry (1864) and the Chancellor's English essay (1868). He seemed destined for distinction as a poet, his volume of Ludibria Lunae (1860) being followed in 1870 by the remarkably fine Paradise of Birds. But a certain academic quality of mind seemed to check his output in verse and divert it into the field of criticism. Apart from many contributions to the higher journalism, his literary career is associated mainly with his continuation of the edition of Pope's works, begun by Whitwell Elwin (1816–1900), which appeared in ten volumes from 1871–1886; his life of Addison (Men of Letters series, 1882); his Liberal Movement in English Literature (1883); and his tenure of the chair of English Literature at Oxford, in which he resulted in his elaborate History of English Poetry (the first volume appearing in 1893), and his Life in Poetry (1901). He deals with the history of English poetry as a whole, and in its unity as a result of the national spirit and thought in succeeding ages, and attempts to bring the great poets into relation with this. In 1887 he was appointed a civil service commissioner, being first commissioner in 1892, and being made a C.B. He was made an honorary fellow of his old college at Oxford in 1896, and was given the honorary degrees of D.Litt. by Durham in 1893 and of L.L.D. by Edinburgh University in 1898.

Court Leet, an English petty criminal court for the punishment of small offences. It has been usual to make a distinction between court baron and court leet as being separate courts, but in the early history of the court leet no such distinction

1 The history of the word ‘leet’ is very obscure. It appears in Anglo-French documents as lele and in Anglo-Latin as lata. Professor W. W. Skeat has connected it with Old English lātān, to let, liberate, and suggested his doubt about the origin of the use of the word in such expressions as "two-" "three-way leet," a place where cross-roads meet. The New English Dictionary suggests a connexion with ‘lathe,’ a term which survives as a division of the Suffolk hundred, containing "hundreds." This is of Old Norwegian origin, and seems to have meant "landed possessions." There is also another Old Norwegian leð, a court or judicial assembly, and modern Danish has læg, a division of the country for military purposes. J. H. Round (Feudal England, p. 101) points out that the Suffolk hundred was divided for assessment into equal blocks called "leets" (see further F. W. Maitland, Select Pleas in Manorial Courts, Selden Soc. Publications I. xxxii–lxxv). "Leet" is also used, chiefly in Scotland, for a list of persons nominated for election to an office. This is, apparently, a shortened form of the French élite, elected.
can be drawn. At a very early time the lords of manors exercised or claimed certain jurisdictional franchises. Of these the most important was the "view of frankpledge" and its attendant police jurisdiction. Some time in the later middle ages the court baron when exercising these powers gained the name of "court leet," and, later, of "court leet." The quo warranto proceedings of Edward I. established a sharp distinction between the court baron, exercising strictly manorial rights, and the court leet, depending for its jurisdiction upon royal franchise. The court leet was a court of record, and its duty was not only to view the pledges but to present by jury all crimes that might happen within the jurisdiction, and punish the same. The steward of the court acted as judge, presiding wholly in a judicial character, and the ministerial acts being executed by the bailiff. The court leet began to decline in the 14th century, being superseded by the more modern courts of the justices, but in many cases courts leet were kept up until nearly the middle of the 19th century. Indeed, it cannot be said that they are now actually extinct, as many still survive for formal purposes, and by s. 40 of the Sheriff's Act 1887 they are expressly kept up.

**COURT-MARTIAL,** a court for the trial of offences against military or naval discipline, or for the administration of martial law. In England courts-martial have inherited part of the jurisdiction of the old Curia militaris, or court of the chivalry, in which a single martial prosecution was held according to the customs and usages of that court, and, in cases omitted according to the civil law, *secundum legem armorum* (Coke, 4 Ins. 17). The modern form of the courts was adopted by ordinance in the time of Charles I., when English soldiers were studying the "articles and military laws" of Gustavus Adolphus and the Dutch military code of Arnhem; it is first recognized by statute in the first Mutiny Act of 1689. The Mutiny Act (with various extensions and amendments) and the statutory articles of war continued to be the sources of military law which courts-martial administered until 1879, when they were codified in the Army Discipline and Regulation Act 1879, which was, in turn, superseded by the Army Act 1881. This act is re-enacted annually by the Army (Annual) Act. The constitution of courts-martial, their procedure, &c., are dealt with under **MILITARY LAW**.

**Naval Courts-Martial.**—The administration of the barbarous naval law of England was long entrusted to the discretion of commanders acting under instructions from the lord high admiral, who was supreme over both the royal and merchant navy. It was the leaders of the Long Parliament who first secured something like proper tribunal by passing in 1645 an ordinance and articles concerning martial law for the government of the navy. Under this ordinance Blake, Monk and Penn issued instructions for the holding general and ship courts-martial with written records, the one for captains and commanders, the other for subordinate officers and men. Of the latter the mate, gunner and boatswain were members, but the admirals reserved a control over the more serious sentences. Under an act of 1661 the high admiral again received power to issue commissions for holding courts-martial—a power which continues to be exercised by the board of admiralty. During the 18th century, under the auspices of Anson, the jurisdiction was greatly extended, and the Consolidation Act of 1749 was passed in which the penalty of death occurs as frequently as the curses in the commination service. The Naval Articles of War have always been statutory, and the whole system may now be said to rest on the Naval Discipline Act 1886, as amended by the act of 1884. The navy has its courts of inquiry for the confidential investigation of charges "derogatory to the character of an officer and a gentleman." Under the act of 1866 a court-martial must consist of from five to nine officers of a certain rank, and may be held only on board of one of H.M. ships of war, and where at least two such ships are together. The rank of the president depends on that of the prisoner. A judge-advocate attends, and the procedure resembles that in military courts, except that the prisoner is not asked to plead, and the sentence, if not one of death, does not require the confirmation of the commander-in-chief abroad or of the admiralty at home. The court has a large and useful power of finding the prisoner guilty of a less serious offence than that charged, which might well be imitated in the ordinary criminal courts. The death sentence is always carried out by hanging at the yard-arm; Admiral Byng, however, was shot in 1757. The board of admiralty have, under the Naval Discipline Acts, a general power of suspending, annulling, and modifying sentences which are not capital. The jurisdiction extends to all persons belonging to the navy, to land forces and other passengers on board, shipwrecked crews, spies, persons born on the books of H.M. ships in commission, and civilians on board who endeavour to seduce others from allegiance. The definition of the jurisdiction by locality includes harbours, havens or creeks, lakes or rivers, in or out of the United Kingdom; all places within the jurisdiction of the admiralty; all places on shore out of the United Kingdom; the dockyards, barracks, hospitals, &c., of the service wherever situated; all places on shore in or out of the United Kingdom for all offences punishable under the Articles of War except those specified in section 36 of the Naval Discipline Act 1860, which are punishable by ordinary law. The Royal Marines, while borne on the books of H.M. ships, are subject to the Naval Discipline Acts, and, by an order in council, 1882, were made subject to the ordinary law for all offences committed on shore. In other cases they are under the Army Acts. By s. 170, sub-sec. 7, of the Army Act, in the application of the act to the Royal Marines the admiralty is substituted for military authorities.

**COURTNEY, LEONARD HENRY COURTNEY, BARON (1832-1882),** English politician and man of letters, eldest son of J. S. Courtney, a banker, was born at Penzance on the 6th of July 1832. At Cambridge, Leonard Courtney was second wrangler and first Smith's prize-man, and was elected a fellow of his college, St John's. He was called to the bar at Lincoln's Inn in 1858, was professor of political economy at University College from 1872 to 1875, and in December 1875, after a previous unsuccessful attempt, was elected to parliament, for Liskeard in the Liberal interest. He continued to represent the borough, and the district into which it was merged by the Reform Act of 1885, until 1900, when he had to give way to Mr. War—was one of the foremost of the so-called "Pro-Boer" party—compelled his retirement. Until 1885 he was a devoted adherent of Mr Gladstone, particularly in finance and foreign affairs. In 1886 he was under-secretary of state for the home department, in 1881 for the colonies, and in 1882 secretary to the treasury; but he was always a stubborn fighter for principle, and upon finding that the government's Reform Bill in 1884 contained no recognition of the scheme for proportional representation, to which he was deeply committed, he resigned office. He refused to support Mr Gladstone's Home Rule Bill in 1885, and was one of those who chiefly contributed to its rejection, and whose reputation for unbending integrity and intellectual eminence gave solidity to the Liberal Unionist party. In 1886 he was elected chairman of committees in the House of Commons, and his efficiency in this office seemed to mark him out for the speakership in 1895. A Liberal Unionist, however, could only be elected by Conservative votes, and he had made himself objectionable to a large section of the party by his independent attitude on various questions, on which his Liberalism outweighed his party loyalty. He would in any case have been incapacitated by an affection of the eyesight, which for a while threatened to withdraw him from public life altogether. After 1895 Mr Courtney's diversions from the Unionist party on questions other than Irish politics became gradually more marked. He became known in the House of Commons principally for his candid criticism of the measures introduced by his nominal leaders, and he was rather to be ranked among the Opposition than as a Ministerialist; and when the crisis with the Transvaal
COURTOIS—COURVOISIER

329

came in 1859, Mr Courtney's views, which remained substantially what they were when he supported the settlement after Majuba in 1881, had plainly become incompatible with his position even as a nominal follower of Lord Salisbury and Mr Chamberlain. He gradually reverted to formal membership of the Liberal party, and in January 1906 unsuccessfully contested a division of Edinburgh as a supporter of Sir Henry Campbell-Bannerman at the general election. Among the birthday honours of 1906 he was elevated to the peerage as Baron Courtney of Penwith (Cornwall). Lord Courtney, who in 1883 married Miss Catherine Potter (an elder sister of Mrs Sidney Webb), was a prominent supporter of the women's movement. In earlier years he was a regular contributor to *The Times*, and he wrote numerous essays in the principal reviews on political and economic subjects. In 1901 he published a book on *The Working Constitution of the United Kingdom*.

Two of his brothers, John Mortimer Courtney (b. 1838), and William Prideaux Courtney (b. 1845), also attained public distinction, the former in the government service in Canada (from 1869, retiring in 1906), rising to be deputy-minister of finance, and the latter in the British civil service (1865-1892), and as a prominent man of letters and bibliographer.

**COURTOIS, JACQUES** (1621-1716) and **GUILLAUME** (1628-1679). The two French painters who bore these names are also called by the Italian equivalents Giacomo (or Jacopo) Cortese and Guglielmo Cortese. Each of the brothers is likewise named, from his native province, Le Bourguignon, or Il Borgognone.

Jacques Courtney was born at St Hippolyte, near Besançon, in 1621. His father was a painter, and with him Jacques remained studying up to the age of fifteen. Towards 1637 he came to Italy, was hospitably received at Milan by a Burgundian gentleman, and entered, and for three years remained in, the French military service. The sight of some battle-pictures revived his taste for fine art. He went to Bologna, and studied under the friendly tutelage of Guido; thence he proceeded to Rome, where he painted, in the Cistercian monastery, the "Miracle of the Loaves." Here he took a house and after a while entered upon his own characteristic style of art, that of battle-painting, in which he has been accounted to excel all other old masters; his merits were cordially recognized by the celebrated Cerquozzi, named Michelangelo delle Battaglie. He soon rose from penury to ease, and married a painter's beautiful daughter, Maria Vagini; she died after seven years of wedded life. Prince Matthias of Tuscany employed Courtney on some striking works in his villa, Lappeggio, representing with much historical accuracy the prince's military exploits. In Venice also the artist executed for the senate Sagredo some remarkable battle-pieces. In Florence he entered the Society of Jesus, taking the habit in Rome in 1655; it was calamously rumoured that he adopted this course in order to escape punishment for having poisoned his wife. As a Jesuit father, Courtney painted many works in churches and monasteries of the society. He lived piously in Rome, and died there of apoplexy on the 20th of May 1676 (some accounts say 1670 or 1671). His battle-pieces have movement and fire, warm colouring (now too often blackened), and great command of the brush,—those of moderate dimensions are the more esteemed. They are slight in execution, and tell out best from a distance. Courtney excelled with skill in twelve-battle-subjects of his contemporaries. The Dantzig painter named in Italy Pandolfo Reschi was his pupil.

Guillaume Courtney, born likewise at St Hippolyte, came to Italy with his brother. He went at once to Rome, and entered the school of Pietro da Cortona. He studied also the Bolognese painters and Giovanni Barbieri, and formed for himself a style with very little express mannerism, partly resembling that of Maratta. He painted the "Battle of Joshua" in the Quirinal Gallery, the "Crucifixion of St Andrew" in the church of that saint on Monte Cavallo, various works for the Jesuits, some also in co-operation with his brother. His last production was Christ admonishing Martha. His draughtsmanship is better than that of Jacques, whom he did not, however, rival in spirit, colour or composition. He also executed some etchings. Guillaume Courtney died of gout on the 15th of June 1679.

*COURTRAI* (Flemish, Kortryk), an important and once famous town of West Flanders, Belgium, situated on the Lys Pop. (1904) 34,562. It is now best known for its fine linen, which ranks with that of Lille. The lace factories are also important and employ 3000 hands. But considerable as is the prosperity of modern Courtrai it is but a shadow of what it was in the middle ages during the halcyon period of the Flemish communes. Then Courtrai had a population of 200,000, now it is little over a sixth of that number. On the 11th of July 1302 the great battle of Courtrai (see INFANTRY) was fought outside its walls, when the French army, under the count of Artois, was vanquished by the allied burghers of Bruges, Ypres and Courtrai with tremendous loss. As many as 700 pairs of golden spurs were collected on the field from the bodies of French knights and hung up as an offering in an abbey church of the town, which has long disappeared. There are still, however, some interesting remains of Courtrai's former grandeur. Perhaps the Pont de Broel, with its towers at either end of the bridge, is as characteristic and complete as any monument of ancient Flanders that has come down to modern times. The hôtel de ville, which dated from the 15th century, was in 1792, when restored in 1846, and since then statues have also been added to the former that formerly ornamented the facade. Two richly and elaborately carved chimney-pieces in the hôtel de ville merit special notice. The one in the council chamber upstairs dates from 1527 and gives an allegorical representation of the Virtues and the Vices. The other, three-quarters of a century later, contains an heraldic representation of the noble families of the town. The church of St Martin dates from the 13th century, but was practically destroyed in 1862 by a fire caused by lightning. It has been restored. The most important building at Courtrai is the church of Notre Dame, which was begun by Count Baldwin IX. in 1101 and finished in 1211. The portal and the choir were reconstructed in the 18th century. In the chapel behind the choir is hung one of Van Dyck's masterpieces, "The Erection of the Cross." The chapel of the counts attached to the church dates from 1373, and contained mural paintings of the counts and countesses of Flanders down to the merging of the title in the house of Burgundy. Most if not all of these had become obliterated, but they have now been carefully restored. With questionable judgment portraits have been added of the subsequent holders of the title down to the emperor Francis II. (I. of Austria), the last representative of the houses of Flanders and Burgundy to rule in the Netherlands. Courtrai celebrated the 600th anniversary of the battle mentioned above by erecting a monument on the field in 1902, and also by fêtes and historical processions that continued for a fortnight.

Courtrai, the *Corròcum* of the Romans, ranked as a town from the 7th century onwards. It was destroyed by the Normans, but was rebuilt in the 10th century by Baldwin III. of Flanders, who endowed it with market rights and laid the foundation of its industrial importance by inviting the settlement of foreign weavers. The town was once more burnt, in 1382, by the French after the battle of Roosebeke, but was rebuilt in 1385 by Philip the Bold, duke of Burgundy.

**COURVOISIER, JEAN JOSEPH ANTOINE** (1775-1833), French magistrate and politician, was born at Besançon on the 10th of November 1775. During the revolutionary period he left the country and served in the army of the *émigrés* and later in that of Austria. In 1801, under the Consulate, he returned to France and established himself as an advocate at Besançon, being appointed conseiller-auditeur to the court of appeal there in 1808. At the Restoration he was made advocate-general by Louis XVIII., resigned and left France during the Hundred Days, and was reappointed after the second Restoration in 1815. In 1817, after the modification of the constitution by the ordonnance of the 5th of September, he was returned to the chamber of deputies, where he attached himself to the left centre and supported the moderate policy of Richelieu and Decazes. He was an eloquent speaker, and master of many subjects; and his proved royalism made it impossible for the ultra-Royalists to discredit him, much as they resented his consistent opposition to
their short-sighted violence. After the revolt at Lyons in 1817 he was nominated procureur-général of the city, and by his sense and moderation did much to restore order and confidence. He was again a member of the chamber from 1820 to 1824, and vigorously opposed the exceptional legislation which the second administration of Richelieu passed under the influence of the ultra-Royalists. In 1824 he failed to secure re-election, and occupied himself with his judicial duties until his nomination as councillor of state in 1827. On the 8th of August 1829 he accepted the offer of the portfolio of justice in the Polignac ministry, but resigned on the 10th of May 1830, when he realized that the government intended to abrogate the Charter and the inevitable revolution that would follow. During the trial of the ex-ministers, in December, he was summoned as a witness, and paid a tribute to the character of his former colleagues which, under the circumstances, argued no little courage. He refused to take office under Louis Philippe, and retired into private life, dying on the 18th of September 1835.

COUSIN, JEAN (1500-1550), French painter, was born at Soucy, near Sens, and began as a glass-painter, his windows in the Sainte Chapelle at Vincennes being considered the finest in France. As a painter of subject pictures he is ranked as the founder of the French school, as having first departed from the practice of portraits. His “Last Judgment,” influenced by Parmigianino, is in the Louvre, and a “Descent from the Cross” (1533) in the museum at Mainz is attributed to him. He was known also as a sculptor, and an engraver, both in etching and on wood, his wood-cuts for Jean le Clerc’s Bible (1596) and other books being his best-known work. He also wrote a Livre de perspective (1580), and a Livre de portraiture (1571).

See Ambroise Firmin-Didot, Étude sur J. Cousin (1872), and Recueil des avis et opinions de J. Cousin (1873).

COUSIN, VICTOR (1792-1867), French philosopher, the son of a watchmaker, was born in Paris, in the Quartier St Antoine, on the 28th of November 1792. At the age of ten he was sent to the grammar school of the Quartier St Antoine, the Lycée Charlemagne. Here he studied until he was eighteen. The lycée had a connexion with the university, and when Cousin left the secondary school he was “crowned” in the ancient hall of the Sorbonne for the Latin oration delivered by him there, in the general concourse of his school competitors. The classical training of the lycée strongly disposed him to literature. He was already known among his compeers for his knowledge of Greek. From the lycée he passed to the Normal School of Paris, where Laromiguère was then lecturing on philosophy. In the second preface to the Fragments philosophiques, in which he candidly states the varied philosophical influences of his life, Cousin speaks of the grateful emotion excited by the memory of the day in 1811, when he heard Laromiguère for the first time, and the influence of that speech on his life. Laromiguère taught the philosophy of Locke and Condillac, happily modified on some points, with a clearness and grace which in appearance at least removed difficulties, and with a charm of spiritual bonhomie which penetrated and subdued.” Cousin was set forthwith to lecture on philosophy, and he speedily obtained the position of master of conferences (maître de conférences) in the school. The second great philosophical impulse of his life was the teaching of Royer-Collard. This teacher, as he tells us, “by the severity of his logic, the gravity and weight of his words, turned me by degrees, and not without resistance, from the beaten path of Condillac into the way which has since become so easy, but which was then painful and unfrequented, that of the Scottish philosophy.” In 1815-1816 Cousin attained the position of suppléant (assistant) to Royer-Collard in the history of modern philosophy chair of the faculty of letters. There was still another thinker who influenced him at this early period,—Maine de Biran, whom Cousin regarded as the unequalled psychological observer of his time in France.

These men strongly influenced both the method and the matter of Cousin’s philosophical thought. To Laromiguère he attributes the lesson of decomposing thought, even though the reduction of it to sensation was inadequate. Royer-Collard taught him that even sensation is subject to certain internal laws and principles which it does not itself explain, which are superior to analysis and the natural patrimony of the mind. De Biran made a special study of the phenomena of the will. He taught him to distinguish in all cognitions, and especially in the simplest facts of consciousness, the fact of voluntary activity, that activity in which our personality is truly revealed. It was through this “triple discipline,” as he calls it, that Cousin’s philosophical thought was first developed, and that in 1815 he entered on the public teaching of philosophy in the Normal School and in the faculty of letters. He then took up the study of German, worked at Kant and Jacobi, and sought to master the Philosophy of Nature of Schelling, by which he was at first greatly attracted. The influence of Schelling may be observed very markedly in the earlier form of his philosophy. He sympathized with the principle of faith of Jacobi, but regarded it as arbitrary so long as it was not recognized as grounded in reason. In 1817 he went to Germany, and met Hegel at Heidelberg. In this year appeared Hegel’s Encyclopädie der philosophischen Wissenschaften, of which Cousin had one of the earliest copies. He thought Hegel not particularly amiable, but the two became friends. The following year Cousin went to Munich, where he met Schelling for the first time, and spent a month with him and Jacobi, obtaining a deeper insight into the Philosophy of Nature.

The political troubles of France interfered for a time with his career. In the events of 1814-1815 he took the royalist side. He at first adopted the views of the party known as doctrinaire, of which Royer-Collard was the philosophical chief. He seems then to have gone farther than his party, and even to have approached the extreme Left. Then came a reaction against liberalism, and in 1821-1822 Cousin was deprived of his offices alike in the faculty of letters and in the Normal School. The Normal School itself was swept away, and Cousin shared at the hands of a narrow and illiberal government the fate of Guizot, who was ejected from the chair of history. This enforced abandonment of public teaching was not wholly an evil. He set out for Germany with a view to further philosophical study. While at Berlin in 1824-1825 he was thrown into prison, either on some ill-defined political charge at the instance of the French police, or on account of certain incautious expressions which he had let fall in conversation. Liberated after six months, he continued under the suspicion of the French government for three years. It was during this period, however, that he thought out and developed what is distinctive in his philosophical doctrine. His eclecticism, his ontology and his philosophy of history were declared in principle and in most of their salient details in the Fragments philosophiques (Paris, 1826). The preface to the second edition of the Fragments (1834) is largely a vindication of his principles against contemporary criticism. Even the best of his later books, the Philosophie éccasiee (4th ed., 1863), the Du vrai, du beau, et du bien (12th ed., 1872; Eng. trans., 3rd ed., Edinburgh, 1854), and the Philosophie de Locke (4th ed., 1861) were simply matured revisions of his lectures during the period from 1815 to 1820. The lectures on Locke were first sketched in 1819, and fully developed in the course of 1820.

During the seven years of enforced abandonment of teaching he produced, besides the Fragments, the edition of the works of Proclus (6 vols., 1820-1827), and the works of Descartes (11 vols., 1860). He also commenced his Translation of Plato (13 vols.), which occupied his leisure time from 1825 to 1840.

We see in the Fragments very distinctly the fusion of the different philosophical influences by which his opinions were finally matured. For Cousin was as eclectic in thought and habit of mind as he was in philosophical principle and system. It is

1 Fragments philosophiques—préface deuxième.
with the publication of the *Fragment* of 1826 that the first great widening of his reputation is associated. In 1827 followed the *Cours de l'histoire de la philosophie*. 

In 1828 M. de Vatimesnil, minister of public instruction in Martignac's ministry, recalled Cousin and Guizot to their professorial positions in the university. The three years which followed were the period of Cousin's greatest triumph as a lecturer. His return to the chair was the symbol of the triumph of constitutional ideas and was greeted with enthusiasm. The hall of the Sorbonne was crowded as the hall of no philosophical teacher in Paris had been since the days of Abélard. The lecturer had a singular power of identifying himself for the time with the system which he expounded and the historical character he portrayed. Clear and comprehensive in the grasp of the general outlines of his subject, he was methodical and vivid in the representation of details. In exposition he had the rare art of unfolding and agrandizing. There was a rich, deep-toned, resonant eloquence mingled with the speculative exposition; his style of expression was clear, elegant and forcible, abounding in happy turns and striking antitheses. To this was joined a singular power of rhetorical climax. His philosophy exhibited in a striking manner the generalizing tendency of the French intellect, and its logical need of grouping details round central principles.

There was withal a moral elevation in his spiritual philosophy which came home to the heart of his hearers, and seemed to afford a ground for higher development in national literature and art, and even in politics, than the traditional philosophy of France had appeared capable of yielding. His lectures produced more ardent disciples, imbued at least with his spirit, than those of any other professor of philosophy in France during the 18th century. Tested by the power and effect of his teaching influence, Cousin occupies a foremost place in the rank of professors of philosophy, who like Jacobi, Schelling and Dugald Stewart have united the gifts of speculative, expository and imaginative power. Tested even by the strength of the reaction which his writings have in some cases occasioned, his influence is hardly less remarkable. The taste for philosophy—especially its history—was revived in France to an extent unknown since the 17th century.

Among the men who were influenced by Cousin may note T. S. Jouvroy, J. P. Damiron, Garnier, J. Barthélemy St Hilaire, F. Ravaisson-Mollion, Rémusat, Jules Simon and A. Franck. Jouvroy and Damiron were first fellow-students and then disciples. Jouvroy, however, always kept firm to the early French and Scottish—impulses of Cousin's teaching. Cousin continued to lecture regularly for two years and a half after his return to the chair. Sympathizing with the revolution of July, he was at once recognized by the new government as a friend of national liberty. Writing in June 1833 he explains both his philosophical and his political position—

"I had the advantage of holding united against me for many years both the sensational and the theological school. In 1830 both schools descended into the arena of politics. The sensational school quite naturally produced the demagogic party, and the theological school became quite as naturally absolutism, safe to bow from time to time the mask of the demagogue in order the better to reach its ends, as in philosophy it is by scepticism that it undertakes to restore theroacy. On the other hand, he who combated any exclusive principle in science was bound to reject also any exclusive principle in the state, and to defend responsible government."

The government was not slow to do him honour. He was induced by the ministry of which his friend Guizot was the head to become a member of the council of public instruction and counsellor of state, and in 1832 he was made peer of France. He ceased to lecture, but retained the title of professor of philosophy. Finally, he accepted the position of minister of public instruction in 1840 under Thiers. He was besides director of the Normal School and virtual head of the university, and from 1840 a member of the Institute (Academy of the Moral and Political Sciences). His character and his official position at this period gave him great power in the university and in the educational arrangements of the country. In fact, during the seventeen and a half years of the reign of Louis Philippe, Cousin mainly moulded the philosophical and even the literary tendencies of the cultivated class in France.

But the most important work he accomplished during this period was the organization of primary instruction. It was to the efforts of Cousin that France owed her advance, in primary education, between 1830 and 1848. Prussia and Saxony had set the national example, and France was guided into it by Cousin. Forgetful of national calamity and of personal wrong, he looked to Prussia as affording the best example of an organized system of national education; and he was persuaded that "to carry back the education of Prussia into France afforded a nobler (if a bloodless) triumph than the trophies of Austerlitz and Jena." In the summer of 1831, commissioned by the government, he visited Frankfort and Saxony, and spent some time in Berlin. The result was a series of reports to the minister, afterwards published as *Rapport sur l'état de l'instruction publique dans quelques pays de l'Allemagne et particulièrement en Prusse.* (Compare also *De l'instruction publique en Hollande, 1837.* ) His views were readily accepted on his return to France, and soon afterwards through his influence there was passed the law of primary instruction. (See his *Exposé des motifs et projet de loi sur l'instruction primaire, présenté la chambre des députés, séance du 23 janvier 1833.*)

In the words of the *Edinburgh Review* (July 1834), these documents "mark an epoch in the progress of national education, and are directly conducive to results important not only to France but to Europe." The *Report* was translated into English by Mrs Sarah Austin in 1834. The translation was frequently reprinted in the United States of America. The legislatures of New Jersey and Massachusetts distributed it in the schools at the expense of the states. Cousin remarks that, among all the literary distinctions which he had received, "None has touched me more than the title of foreign member of the American Institute for Education." To the enlightened views of the ministries of Guizot and Thiers under the citizen-king, and to the zeal and ability of Cousin in the work of organization, France owes what is best in her system of primary education,—a national interest which has been neglected under the Revolution, the Empire and the Restoration (see *Exposé*, p. 17). In the first two years of the reign of Louis Philippe more was done for the education of the people than had been either sought or accomplished in all the history of France. In defence of university studies he stood manfully forth in the chamber of peers in 1844, against the clerical party on the one hand and the levelling of Philippe on the other. His speeches on this occasion were published in a tractate *Défense de l'université et de la philosophie* (1844 and 1845).

This period of official life from 1830 to 1848 was spent, so far as philosophical study was concerned, in revising his former lectures and writings, in maturing them for publication or reissue, and in research into certain periods of the history of philosophy. In 1835 appeared De la *Métaphysique d'Aristote, suivi d'un essai de traduction des deux premiers livres*; in 1836, *Cours de philosophie professe à la faculté des lettres pendant l'année 1818, et Ouvrages inédits d'Abelard.* This *Cours de philosophie* appeared later in 1854 as *Du vrai, du beau, et du bien.* From 1825 to 1840 appeared *Cours de l'histoire de la philosophie*; in 1849 *Manuel de l'histoire de la philosophie de Tennemann,* translated from the German. In 1840-1841 we have *Cours d'histoire de la philosophie morale au XIX* e siècle (5 vols.). In 1841 appeared his edition of the *Oeuvres philosophiques de Maine-de-Biron;* in 1842, *Leçons de philosophie sur Kant* (Eng. trans. A. G. Henderson, 1854), and in the same year *Des Pensées de Pascal.* The *Nouveaux fragments* were gathered together and republished in 1847. Later, in 1859, appeared *Petits Abélards* *Opéra.*

During this period Cousin seems to have turned with fresh interest to those literary studies which he had abandoned for speculation under the influence of Laromiguière and Royer-Collard. To this renewed interest we owe his studies of men
Cousin, V., in his work on phenomenology, discusses the development of consciousness during the 18th century in France. He examines how the study of women and the perception of consciousness, especially in the context of philosophical history, can be understood.

**Method.**
Cousin views phenomenology as a method that studies consciousness. It is a reflection on the nature of consciousness and its role in historical and intellectual development. Cousin's method involves a historical approach to understanding consciousness, as opposed to the classical methods of analysis and induction.

**Results.**
Cousin's results show how consciousness is formed and how it interacts with the historical context. His method is designed to reveal the essential nature of consciousness and its role in philosophical inquiry. Cousin's work is characterized by a focus on the phenomenon of consciousness, rather than on abstract principles or systems.

Cousin's methodology is characterized by its historical and philosophical focus, which allows for a deeper understanding of the evolution and development of consciousness. His work is groundbreaking in its attempt to understand consciousness as a phenomenon that is both historical and philosophical.
necessary. The recognition of universal and necessary principles in knowledge is the essential point in psychology: it ought to be put first and emphasized to the last that these exist, and that they are wholly impersonal or absolute.

The number of these principles, their enumeration and classification, is an important point, but it is secondary to that of the recognition of their true nature. This was the point which Kant missed in his analysis, and this is the fundamental truth which Cousin thinks he has restored to the integrity of philosophy by the method of the observation of consciousness. And how is this impersonality or absoluteness of the conditions of knowledge to be established? The answer is in substance that Kant went wrong in putting necessity first as the criterion of those laws. This brought them within the sphere of reflection, and gave as their guarantee the impossibility of thinking them reversed; and led to their being regarded as wholly relative to human intelligence, restricted to the sphere of the phenomenal, incapable of revealing to us substantial reality—necessary, yet subjective. (But this test of necessity is a whole secondary one; these laws are not thus guaranteed to us; they are each and all given to us, given to our consciousness, in an act of spontaneous apperception or apprehension, immediately, instantaneously, in a sphere above the reflective consciousness, yet within the reach of knowledge. And "all subjectivity with all reflection expires in the spontaneity of apperception. The reason becomes subjective by relation to the voluntary and free self; but in itself it is impersonal; it belongs not to this or to that self in humanity; it belongs not even to humanity. We may say with truth that nature and humanity belong to it, for without its laws both would perish.")

But what is the number of those laws? Kant reviewing the enterprise of Aristotle in modern times has given a complete list of the laws of thought, but it is arbitrary in classification and may be legitimately reduced. According to Cousin, there are but two primary laws of thought, that of causality and that of substance. From these flow naturally all the others. In the order of nature, that of substance is the first and causality second. In the order of acquisition of our knowledge, causality precedes substance, or rather both are given us in each other, and are contemporaneous in consciousness.

These principles of reason, cause and substance, given thus psychologically, enable us to pass beyond the limits of the relative and subjective to objective and absolute reality.—enable us, in a word, to pass from psychology, or the science of knowledge, to ontology or the science of being. These laws are inextricably mixed in consciousness with the data of volition and sensation, with free activity and fatal action or impression, and they guide us in rising to a personal being, a self or free cause, and to an impersonal reality, a not-me—nature, the world of force—lying out of us, and modifying us. As I refer to myself the act of attention and volition, so I cannot but refer the sensation to some cause, necessarily other than myself, that is, to an external cause. (God is in the position for me to my own existence since the phenomenon which suggests it to me is as certain as the phenomenon which had suggested my reality, and both are given in each other.) I thus reach an objective impersonal world of forces which corresponds to the variety of my sensations.

The relation of these forces or causes to each other is the order of the universe.

But these two forces, the me and the not-me, are reciprocally limitative. As reason has apprehended these two simultaneous phenomena, attention and sensation, and led us immediately to conceive the two sorts of distinct causes, correlative and reciprocally finite, to which they are related, so, from the notion of this distinction, we find it impossible under the same guide not to conceive a supreme cause, absolute and infinite, itself the first and last cause of all. This is relatively to self and not-self what these are to their proper effects. This cause is self-sufficient, and is sufficient for the reason. This is God; he must be conceived under the notion of cause, related to humanity and the world. He is absolute substance only in so far as he is absolute cause, and his essence lies precisely in his creative power. He thus creates, and he creates necessarily.

This theodicy of Cousin laid him open obviously enough to the charge of pantheism. This he repels, and his answer may be summed up as follows. Pantheism is properly the deficiation of the law of phenomena, the universe God. But I distinguish the two finite causes self and not-self from each other and from the infinite cause. They are not mere modifications of this cause or properties, as with Spinoza,—they are free forces having their power or spring of action in themselves, and this is sufficient for our idea of independent finite reality. I hold this, and I hold the relation of these as effects to the one supreme cause. The God I plead for is neither the deity of Pantheism, nor the absolute unity of the Eleatics, a being divorced from all possibility of creation or plurality, a mere metaphysical abstraction. The deity I maintain is creative, and necessarily creative. The deity of Spinoza and the Eleatics is a mere substance, not a cause in any sense. As to the necessity under which Deity exists of acting or creating, this is the highest form of liberty, it is the freedom of spontaneity, activity without deliberation. His action is not the result of a struggle between passion and virtue. He is free in an unlimited manner the purest spontaneity in man is but the shadow of the freedom of God. He acts freely but not arbitrarily, and with the consciousness of being able to choose the opposite part. He cannot deliberate or will as we do. His spontaneous action excludes at once the efforts and the miseries of will and the mechanical operation of necessity.

The elements found in consciousness are also to be found in the history of humanity and in the history of philosophy. In external nature there are expansion and contraction which correspond to spontaneity and reflection. External nature again in contrast with humanity expresses spontaneity; humanity expresses reflection. In human history the East represents the spontaneous stage; the Pagan and Christian world represent stages of reflection. This was afterwards modified, expanded and more fully expressed by saying that humanity in its universal development has three principal moments. First, in the spontaneous stage, where reflection is not yet developed, and art is imperfect, humanity has thought only of the immensity around it. It is preoccupied by the infinite. Secondly, in the reflective stage, mind has become an object to itself. It thus knows itself explicitly or reflectively. Its own individuality is now the only or at least the supreme thing. This is the moment of the finite. Thirdly, there comes an epoch in which the self or me is sub-ordinated. Mind realizes another power in the universe. The finite and the infinite become two real correlatives in the relation of cause and product. This is the third and highest stage of development, the relation of the finite and the infinite. As philosophy is but the highest expression of humanity, these three moments will be represented in its history. The East typifies the spontaneous stage. The Pagan and Christian epochs, the modern era the stage of relation or correlation of infinite and finite. In theology, the dominant philosophical idea of each of these epochs results in pantheism, polytheism, theism. In politics we have in correspondence also with the idea, monarchy, democracy, constitutionalism.

Eclecticism thus means the application of the psychological method to the history of philosophy. Confronting the various systems co-ordinated as sensualism, idealism, scepticism, mysticism, with the facts of consciousness, the result was reached "that each system expresses an order of phenomena and ideas, which is in truth very real, but which is not alone in consciousness, and which at the same time holds an almost exclusive place in the system; whence it follows that each system is not false but incomplete, and that in re-uniting all incomplete systems, we should have a complete philosophy, adequate to the totality of consciousness." Philosophy, as thus perfected, would not be a mere aggregation of systems, as is ignorantly supposed, but an integration of the truth in each system after the false or incomplete is discarded.
Such is the system in outline. The historical position of the system lies in its relations to Kant, Schelling and Hegel. Cousin was opposed to Kant in asserting that the unconditioned in the form of infinite or absolute cause is but a mere unrealizable tentative or effort on the part of the mind, something different from a mere negation, yet not equivalent to a positive thought. With Cousin the absolute as the ground of being is grasped positively by the intelligence, and it renders all else intelligible; it is not as with Kant a certain hypothetical or regulative need.

With Schelling again Cousin agrees in regarding this supreme ground of all as positively apprehended, and as a source of development, but he utterly repudiates Schelling's method. The intellectual intuition either falls under the eye of consciousness, or it does not. If not, how do you know it and its object which are identical? If it does, it comes within the sphere of psychology; and the objections to it as thus a relative, made by Schelling himself, are to be dealt with. Schelling's intellectual intuition is the mere negation of knowledge.

Again the pure being of Hegel is a mere abstraction,—a hypothesis illegitimately assumed, which he has nowhere sought to vindicate. The very point to be established is the possibility of reaching being per se or pure being; yet in the Hegelian system this is the very thing assumed as a starting-point. Besides this, of course, objections might be made to the method of development, as not only subverting the principle of contradiction, but as galvanizing negation into a means of advancing or developing the whole body of human knowledge and reality. The intellectual intuition of Schelling, as above consciousness, the pure being of Hegel, as an empty abstraction, unvindicated, illegitimately assumed, and arbitrarily developed, are equally useless as bases of metaphysics. This led Cousin, still holding by essential knowledge of being, to ground it in an analysis of consciousness,—in psychology.

Here the unconditioned ground and source of all reality—i.e. is yet apprehended by us as an immediate datum or reality; and it is apprehended in consciousness,—under its condition, that, to wit, of distinguishing subject and object, knower and known. The doctrine of Cousin was criticized by Sir W. Hamilton in the Edinburgh Review of 1829, and it was animadverted upon at the same time by Schelling. Hamilton's objections are as follows. The correlation of the ideas of infinite and finite does not necessarily imply their co-reality, as Cousin supposes; on the contrary, it is a presumption that finite is simply positive and infinite negative of the same—that the finite and infinite are simply contradictory relatives. Of these "the positive alone is real, the negative is only an abstraction of the other, and in the highest generality even an abstraction of thought itself." A study of the few sentences under this head might have obviated the trifling criticism of Hamilton's objection which has been set up, and recently, that the denial of a knowledge of the absolute or infinite implies a foregone knowledge of it. How can you deny the reality of that which you do not know? The answer to this is that in the case of contradictory statements—A and not A—the latter is a mere negation of the former, and posits nothing; and the negation of a notion with positive attributes, as the finite, does not extend beyond abolishing the given attributes as an object of thought. The infinite or non-finite is not necessarily known, ere the finite is negated, or in order to negate it; all that needs be known is the finite itself; and the contradictory negation of it implies no positive. Non-organized may or may not correspond to a positive—i.e. an object or notion with qualities contradictory of the organized; but the mere sublation of the organized does not posit it, or suppose that it is known beforehand, or that anything exists corresponding to it. This is one among many flaws in the Hegelian dialectic, and it paralyzes the plan of development. Secondly, the conditions of intelligence, which Cousin allows, necessarily exclude the possibility of knowledge of the absolute—they are held to be incompatible with its unity. Here Schelling and Hamilton argue that Cousin's absolute is a mere relative. Thirdly, it is objected that in order to deduce the conditioned, Cousin makes his absolute a relative; for he makes it an absolute cause, i.e. a cause existing absolutely under relation. As such it is necessarily inferior to the sum total of its effects, and dependent for reality on these—in a word, a mere potentialise or becoming. Further, as a theory of creation, it makes creation a necessity, and destroys the notion of the divine. Cousin made no reply to Hamilton's criticism beyond alleging that Hamilton's doctrine necessarily restricted human knowledge and certainty to psychology and logic, and destroyed metaphysics by introducing nescience and uncertainty into its highest sphere—theodicity.

The attempt to render the laws of reason or thought impersonal by professing to find them in the sphere of spontaneous apperception, and above reflective necessity, can hardly be regarded as successful. It may be that we first of all primitives or spontaneously affirm cause, substance, causality, identity, time, space, &c., in this way. But these are still in each instance given us as realized in a particular form. In no single act of affirmation of cause or substance, as much less in such a primitive act, do we affirm the universality of their application. We might thus get particular instances or cases of these laws, but we could never get the laws themselves in their universality, far less absolute impersonality. And as they are not supposed to be mere generalizations from experience, no amount of individual instances of the application of any one of them by us would give it a true universality. The only sure test we have of their universality in our experience is the test of their reflective necessity. We thus after all fall back on reflection as our ground for their universal application; mere spontaneity of apprehension is futile; their universality is grounded in their necessity, not their necessity in their universality. How far and in what sense this ground of necessity renders them personal are of course questions still to be solved.

But if these three correlative facts are immediately given, it seems to me that hence also every conclusion of these to reflective consciousness. He seeks to trace the steps by which the reason has spontaneously and consciously, but irreflexively, followed. And here the question arises—Can we vindicate in a reflective or mediate process this spontaneous apprehension of reality?

The self is found to be a cause of force, free in its action, on the ground that we are obliged to relate the volition of consciousness to the self as its cause, and its ultimate cause. It is not clear from the analysis whether the self is immediately observed as an acting or originating cause, or whether reflection working on the principle of causality is compelled to infer its existence and character. If self is actually so given, we do not need the principle of causality to infer it; if it is not so given, causality could never give us either the notion or the fact of self as a cause or force, far less as an ultimate one. All that it could do would be to warrant a cause of some sort, but not this or that reality as the cause. And further, the principle of causality, if fairly carried out, as universal and necessary, would not allow us to stop at personality or will as the ultimate cause of its effect—volition. Once applied to the facts at all, it would drive us beyond the first antecedent or term of antecedents of volition to a still further cause or ground,—in fact, land us in an infinite regress of causes.

The same criticism is even more emphatically applicable to the influence of a not-self, or world of forces, corresponding to our sensations, and the cause of them. Starting from sensation as our basis, causality could never give us this, even though it be allowed that sensation is impersonal to the extent of being independent of our volition. Causality might tell us that a cause there is of sensation somewhere and of some sort; but that this cause is a force or sum of forces, existing in space, independently of us, and corresponding to our sensations, it could never tell us, for the simple reason that such a notion is not supposed to exist in the consciousness. Causality cannot add to the number of our notions,—cannot add to the number of realities we know.

All it can do is to necessitate us to think that a cause there is of a given change, but what that cause is it cannot of itself inform us, or even suggest to us, beyond implying that it must be adequate
to the effect. Sensation might arise, for aught we know, so far as causality leads us, not from a world of forces at all, but from a will like ours, though infinitely more powerful, acting upon us, partly furthering and partly thwarting us. And indeed such a supposition is, with the principle of causality at work, within the limits of probability, as we are already supposed to know such a reality—a will—in our own consciousness. When Cousin thus set himself to vindicate those points by reflection, he gave up the obvious advantage of his other position that the realities in question are given us in immediate and spontaneous apprehension. The same criticism applies equally to the inference of an absolute cause from the two limited forces which he names self and not-self. Immediate spontaneous apprehension may seize this supreme reality; but to vindicate it by reflection as an inference on the principle of causality is impossible. This is a mere paradoxism; we can never infer either absolute or infinite from relative or finite.

The truth is that Cousin’s doctrine of the spontaneous apprehension of impersonal truth amounts to little more than a presentation in philosophic language of the ordinary convictions and beliefs of mankind. This is important as a preliminary stage of philosophy properly begins when it attempts to co-ordinate or systematize those convictions in harmony, to conciliate apparent contradiction and opposition, as between the correlative notions of finite and infinite, the apparently conflicting notions of personality and infinitude, self and not-self; in a word, to reconcile the various sides of consciousness with each other. And whether the laws of our reason are the laws of all intelligence and being—whether and how we are to relate our fundamental, intellectual and moral conceptions to what is beyond our experience, or to an infinite being—are problems which Cousin cannot be regarded as having solved. These are in truth the outstanding problems of modern philosophy.

Cousin’s doctrine of spontaneity in volition can hardly be said to be more successful than his impersonality of the reason through spontaneous apprehension. Sudden, unpremeditated volition may be the earliest and the most artistic, but it is not the best. Volition is essentially a free choice between alternatives, and that is best which is most deliberate, because it is most rational. Aristotle touched this point in his distinction between Βελτυμον and προκειμενον. The sudden and unpremeditated wish represented by the former is wholly inferior in character to the free choice of the latter, guided and illumined by intelligence. In this we can deliberately resolve upon what is in our power; in that we are subject to the vain impulse of wishing the impossible. Spontaneity is pleasing, sometimes beautiful, but it is not in this instance the highest quality of the thing to be obtained. That is to be found in a guiding and illumining reflective activity.

Eclecticism is not open to the superficial objection of proceeding without a system or test in determining the complete or incomplete. But it is open to the objection of assuming that a particular analysis of consciousness has reached all the possible elements in humanity and in history, and their combinations. It may be asked, Can history show that which is not in the individual consciousness? In a sense not; but our analysis may not give all that is there, and we ought not at once to impose that analysis or any formula on history. History is as likely to reveal to us in the first place true and original elements, and combinations of elements in man, as a study of consciousness. Besides, the tendency of applying a formula of this sort to history is to assume that the elements are developed in a certain regular or necessary order, whereas this may not at all be the case; but we may find at any epoch the whole mixed, either crossing or co-operative, as in the consciousness of the individual himself. Further, the question as to how these elements may possibly have grown up in the general consciousness of mankind is assumed to be nonexistent or impossible.

It was the tendency of the philosophy of Cousin to outline things and to fill up the details in an artistic and imaginative interest. This is necessarily the case, especially in the application to history of all formulas supposed to be derived either from an analysis of consciousness, or from an abstraction called pure thought. Cousin was observational and generalizing rather than analytic and discriminating. His search into principles was not profound, and his power of rigorous consecutive development was not remarkable. He left no distinctive or new principle of philosophy. But he left very interesting psychological analyses, and several new, just, and true expositions of philosophical systems, especially that of Locke and the philosophers of Scotland. He was at the same time a man of impressive power, of rare and wide culture, and of lofty aim—far above priestly conception and Philistine narrowness. He was familiar with the broad lines of nearly every system of philosophy ancient and modern. His eclecticism was the proof of a reverential sympathy with the struggles of human thought to attain to certainty in the highest problems of speculation. It was eminently a doctrine of comprehension and of toleration. In these respects it formed a marked and valuable contrast to the arrogance of absolutism, to the dogmatism of sensationalism, and to the doctrine of church authority, preached by the theological school of his day. His spirit, while it influenced the youth of France, saved them from the false influences. As an educational reformer, as a man of letters and learning, who trod "the large and impartial ways of knowledge," and who swayed others to the same paths, as a thinker influential alike in the action and the reaction to which he led, Cousin stands out conspicuously among the memorable Frenchmen of the 19th century.

Sir W. Hamilton (Discussions, p. 541), one of his most resolute opponents, described Cousin as "A profound and original thinker, a lucid and eloquent writer, a scholar equally at home in ancient and in modern learning, a philosopher superior to all prejudices of age or country, party or profession, and whose lofty eclecticism, seeking truth under every form of opinion, traces its unity even through the most hostile systems."

Cousin—Cousins

Cousin (Fr. cousin, Ital. cugino, Late Lat. cosinus, perhaps a popular and familiar abbreviation of consobrinus, which has the same sense in classical Latin), a term of relationship. Children of brothers and sisters are to each other first cousins, or cousins-german; the children of first cousins are to each other second cousins, and so on; the child of a first cousin is the first cousin of his father or mother a first cousin once removed.

The word cousin has also, since the 16th century, been used by sovereigns as an honorific style in addressing persons of exalted, but not equal, rank, the term “brother” being reserved as the style used by one sovereign in addressing another. Thus, in Great Britain, dukes, marquesses and earls are addressed by the sovereign in royal writs, &c., as cousin. In France the kings thus addressed princes of the blood royal, archbishops, dukes and peers, the marshals of France, the grand officers of the crown and certain foreign princes. In Spain the right to be thus addressed is a privilege of the grandees.

Cousins, Samuel (1801–1883), English mezzotint engraver, was born at Exeter on the 8th of May 1801. He was pre-eminent the interpreter of Sir Thomas Lawrence, his contemporary. During his apprenticeship to S. W. Reynolds he engraved many of the best amongst the three hundred and sixty little mezzotints illustrating the works of Sir Joshua Reynolds which his master issued in his own name. In the finest of his numerous transcripts of Lawrence, such as "Lady Acland and her Sons," "Pope Pius VII." and "Master Lambton," the distinguishing characteristics of the engraver’s work, brilliancy and force of effect in a high key, corresponded exactly with similar qualities in the painter. After the introduction of steel
COUSTOU—COUSTANCES

for engraving purposes about the year 1823, Cousins and his contemporaries were compelled to work on it, because the soft copper previously used for mezzotint plates did not yield a sufficient number of fine impressions to enable the method to compete commercially against line engraving, from which much larger editions were obtainable. The painter-like quality which distinguished the 18th-century mezzotints on copper was wanting in his later works, because the hardness of the steel on which they were engraved impared freedom of execution and richness of tone, and so enhanced the labour of scraping that he accelerated the work by stipples, etching the details instead of scraping them out of the "ground" in the manner of his predecessors. To this "mixed style," previously used by Richard Earlom on copper, Cousins added heavy roulette and rocking-tool textures, tending to fortify the darks, when he found that the "bury" even on steel failed to yield enough fine impressions to meet the demand. The effect of his prints in this method after Reynolds and Millais was mechanical and out of harmony with the picturesque technique of these painters, but the phenomenal popularity which Cousins gained for his works at least kept alive and in favour a form of mezzotint engraving during a critical phase of its history.

Abraham Raimbach, the line engraver, dated the decline of his own art in England from the appearance in 1837 of Cousins's print (in the "mixed style") after Landseer's "Bolton Abbey." Such plates as "Miss Peel," after Lawrence (published in 1833); "A Midsummer Night's Dream," after Landseer (1857); "The Order of Release" and "The First Minuet," after Millais (1863 and 1868); "The Strawberry Girl" and "Lavinia, Countess Spencer," after Reynolds; and "Miss Rich," after Hogarth (1873-1877), represent various stages of Cousins's mixed method. It reached its final development in the plates after Millais's "Cherry Ripe" and "Avonbridge" (published in 1881 and 1888), when the invention of coating copper plates with a film of steel to make them yield larger editions led to the revival of pure mezzotint on copper, which has since rendered obsolete the steel plate and the mixed style which it fostered.

The fine draughtsmanship of Cousins was as apparent in his prints as in his original lead-pencil portraits exhibited in London in 1882. In 1885 he was elected a full member of the Royal Academy, to which institution he later gave in trust £15,000 to provide annuities for supernannted artists who had not been so successful as himself. One of the most important figures in the history of British engraving, he died in London, unmarried, on the 7th of May 1887.

COUSTOU, the name of a famous family of French sculptors.

Nicolas Cousou (1658-1733) was the son of a wood-carver at Lyons, where he was born. At eighteen he removed to Paris, to study under C. A. Coyezove, his mother's brother, who presided over the recently-established Academy of Painting and Sculpture; and at three-and-twenty he gained the Colbert prize, which entitled him to four years' education at the French Academy at Rome. He afterwards became rector and chancellor of the Academy of Painting and Sculpture. From the year 1720 he was a most active collaborator with Coyezove at the palaces of Marly and Versailles. He was remarkable for his facility; and though he was specially influenced by Michelangelo and Algardi, his numerous works are among the most typical specimens of his age now extant. The most famous are "La Seine et la Marne," "La Saine," the "Berger Chasseur" in the gardens of the Tuileries, the bas-relief "Le Passage du Rhin" in the Louvre, and the "Descent from the Cross" placed behind the choir altar of Notre Dame at Paris.

His younger brother, Guillaume Coustou (1677-1746), was a sculptor of still greater merit. He also gained the Colbert prize; but refusing to submit to the rules of the Academy, he soon left it, and for some time wandered houseless through the streets of Rome. At length he was befriended by the sculptor Legros, under whom he studied for some time. Returning to Paris, he was in 1704 admitted into the Academy of Painting and Sculpture, of which he afterwards became director; and, like his brother, he was employed by Louis XIV. His finest works are the famous group of the "Horse Tamers," originally at Marly, now in the Champs Elysées at Paris, the colossal group "The Ocean and the Mediterranean" at Marly, the bronze "Rhône" which formed part of the statue of Louis XIV. at Lyons, and the sculptures at the entrance of the Hôtel des Invalides. Of these latter, the bas-relief representing Louis XIV. mounted and accompanied by Justice and Prudence was destroyed during the Revolution, but was restored in 1815 by Pierre Cartellier from Coustou's model; the bronze figures of Mars and Minerva, on either side of the doorway, were not interfered with.

Another Guillaume Coustou (1716-1777), the son of Nicolas, also studied at Rome, as winner of the Colbert prize. While to a great extent a copyist of his predecessors, he was much affected by the bad taste of his time, and produced little or nothing of permanent value.

See Louis Gougenot, Éloge de M. Cousin, le Jeune (1903); Arsène Houssaye, Histoire de l'art français au XVIIIe siècle (1860); Lady Dilke, Gazette des beaux-arts, vol. xxiv. (1901) (2 articles).

COUSTANCES, WALTER OF (d. 1207), bishop of Lincoln and archbishop of Rouen, commenced his career in the chancery of Henry II., was elected bishop of Lincoln in 1182, and in 1184 obtained, with the king's help, the see of Rouen. Throughout his career he was much employed in diplomatic and administrative duties. He started with Richard I. for the Third Crusade, but was sent back to Normandy to investigate the charges which the barons and the official class had brought against the chancellor, William Longchamp. There was no love lost between the two; and they were popularly supposed to be rivals for the see of Canterbury. The archbishop of Rouen sided with the barons and John, and sanctioned Longchamp's deposition—a step which was technically warranted by the powers which Richard had given, but by no means calculated to protect the interests of the crown. The Great Council now recognized the archbishop as chief justicar, and he remained at the head of the government till 1193, when he was replaced by Hubert Walter. The archbishop did good service in the negotiations for Richard's release, but subsequently quarrelled with his master and laid Normandy under an interdict, because the border stronghold of Château Gaillard in the Vexin had been built on his land without his consent. After Richard's death, the archbishop joined John as the lawful heir of Normandy and consecrated him as duke. But his personal inclinations leaned to Arthur of Brittany, whom he was with difficulty dissuaded from supporting. The archbishop accepted the French conquest of Normandy with equanimity (1204), although he kept to his old allegiance while the issue of the struggle was in doubt. He did not long survive the conquest, and his later history is a blank.

COUSTANCES, a town of north-western France, capital of an arrondissement of the department of Manche, 7 m. E. of the English Channel and 58 m. S. of Cherbourg on the Western railway. Pop. (1906) 6089. Coustances is beautifully situated on the right bank of the Soule on a granitic eminence crowned by the celebrated cathedral of Notre-Dame. The date of this church has been much disputed, but while traces of Romanesque architecture survive, the building is, in the main, Gothic in style and dates from the first half of the 13th century. The slender turrets massed round the western towers and the octagonal central tower, which forms a lantern within, are conspicuous features of the church. In the interior, which comprises the
nave with aisles, transept and choir with ambulatory and side chapels, there are fine rose windows with stained glass of the 14th century, and other works of art. Of the other buildings of Coutances the church of St Pierre, in which Renaissance architecture is mingled with Gothic, and that of St Nicolas, of the 16th and 17th centuries, demand mention. There is an aqueduct of the 14th century to the west of the town. Coutances is a quiet town with winding streets and pleasant boulevards bordering it on the east; on the western slope of the hill there is a public garden. The town is the seat of a bishop, a court of assizes and a sub-prefecture; it has tribunals of first instance and of commerce, a lycée for boys, a communal college and a training college for girls, and an ecclesiastical seminary. Leather-dressing and wool-spinning are carried on and there is trade in live-stock, in agricultural produce, especially eggs, and in marble.

Coutances is the ancient Cosedia, which before the Roman conquest was one of the chief towns in the country of the Unelli. Towards the end of the 3rd century its name was changed to Constantia, in honour of the emperor Constantius Chlorus, who fortified it. It became the capital of the pagus Constantinus (Coutinum) which in the Middle Ages was the seat of a viscount. It has been an episcopal see since the 5th century. In the 17th century it was the centre of the revolt of the Nu-pieds, caused by the imposition of the salt-tax (gabelle).

A good bibliography of general works and monographs on the archaeology and the history of the town and diocese of Coutances is given in U. Chevallier, Répertoire des sources, etc., Topo-Bibliographie (Montbéliard, 1894-1899), s.v.

COUTHON, GEORGES (1755-1794), French revolutionist, was born at Orcet, a village in the district of Clermont in Auvergne. He studied law, and was admitted advocate at Clermont in 1785. At this period he was noted for his integrity, gentle-heartedness and charitable disposition. His health was feeble and both legs were paralysed. In 1789 he was a member of the provincial assembly of Auvergne. On the outbreak of the Revolution Couthon, who was now a member of the municipality of Clermont-Ferrand, published his L'Aristocrate converti, in which he revealed himself as a liberal and a champion of constitutional monarchy. He became very popular, was appointed president of the tribunal of the town of Clermont in 1791, and in the middle of that year was elected deputy to the Legislative Assembly. His views had meanwhile been embittered by the attempted flight of Louis XVI, and he distinguished himself now by his hostility to the king. A visit to Flanders for the sake of his health brought him into close intercourse and sympathy with Dumouriez. In September 1792 Couthon was elected member of the National Convention, and at the trial of the king voted for the sentence of death without appeal. He hesitated for a time as to which party he should join, but finally decided for that of Robespierre, with whom he had many opinions in common, especially in matters of religion. He was the first to demand the arrest of the proscribed Girondists. On the 30th of May 1793 he became a member of the Committee of Public Safety, and in August was sent as one of the commissioners of the Convention attached to the army before Lyons. Impatient at the slow progress made by the besieging force, he decreed a levé en masse in the department of Puy-de-Dôme, collected an army of 60,000 men, and himself led them to the siege of Lyons, which the city was taken on the 6th of October 1793, although the Convention ordered its destruction, Couthon did not carry out the decree, and showed moderation in the punishment of the rebels. The Republican atrocities began only after Couthon was replaced, on the 3rd of November 1793, by Collot d'Herbois. Couthon returned to Paris, and on the 21st of December was elected president of the Convention. He contributed to the prosecution of the Hébertists, and was responsible for the law of the 22d Prairial, which in the case of trials before the Revolutionary Tribunal deprived the accused of the aid of counsel or of witnesses or their defence, on the pretext of shortening the proceedings. During the crisis preceding the 9th Thermidor, Couthon showed considerable courage, giving up a journey to Auvergne in order, as he wrote, that he might either die or triumph with Robespierre and liberty. Arrested with Robespierre and Saint-Just, his colleagues in the triumvirate of the Terror, and subjected to indescribable sufferings and insults, he was taken to the scaffold on the same cart with Robespierre on the 28th of July 1794 (10th Thermidor).

Mège, Correspondance de Couthon . . . suite de l’'Aristocrate converti,' comédie en deux actes de Couthon (Paris, 1872); and Nouveaux Documents sur Georges Couthon (Clermont-Ferrand, 1890); also F. X. Aulard, Les Orateurs de la Législative et de la Convention (Paris, 1883-1886), ii. 425-443.

COUTTS, THOMAS (1735-1822), English banker and founder of the banking house of Coutts & Co., was born on the 7th of September 1735. He was the fourth son of John Coutts (1690-1752), who carried on business in Edinburgh as a corn factor and negotiator of bills of exchange, and who in 1742 was elected lord provost of the city. The family was originally of Montrose, but one of its members had settled at Edinburgh about 1696. Soon after the death of John Coutts the business was divided into two branches, one carried on in Edinburgh, the other in London. The banking business in London was in the hands of James and Thomas Coutts, sons of John Coutts. From the death of his brother in 1778, Thomas, as surviving partner, became sole head of the firm; and under his direction the banking house rose to the highest distinction. His ambition was to establish his character as a man of business and to make a fortune; and he lived to succeed in this aim and long to enjoy his reputation and wealth. A gentleman in manners, hospitable and benevolent, he counted amongst his friends some of the literary men and the best actors of his day. Of the enormous wealth which came into his hands he made munificent use. His private life was not without its romantic elements. Soon after his settlement in London he married Elizabeth Starkey, a young woman of humble origin, who was in attendance on the daughter of his brother James. They lived happily together, and had three daughters—Susan, married in 1796 to the 3rd earl of Guildford; Frances, married in 1800 to John, 1st marquess of Bute; and Sophia, married in 1793 to Sir Francis Burdett. Mrs Coutts dying in 1815, her husband soon after married the popular actress, Harriet Mellon; and to her he left the whole of his immense fortune. He died in London on the 24th of February 1822. His widow married in 1827 the 9th duke of St Albans, and died ten years later. There were no male issue. His son-in-law, and youngest daughter of Sir Francis Burdett, who then assumed the additional name and arms of Coutts. In 1871 this lady was created Baroness Burdett-Coutts (q.v.).

See C. Rogers, Genealogical Memoirs of the Families of Colli and Coutts (1879); and R. Richardson, Coutts & Co. (1900).

COUTURE, THOMAS (1815-1879), French painter, was born at Senlis (Oise), and studied under Baron A. J. Gros and Paul Delaroche, winning a Prix de Rome in 1837. He began exhibiting historical and genre pictures at the Salon in 1840, and obtained several medals. His masterpiece was his “Romans in the Decadence of the Empire” (1847), now in the Luxembourg; and his “Love of Money” (1844; at Toulouse), “Falconer” (1855), and “Damoiselles” (1872), are also good examples.

COUVADE (literally a “brooding”), from Fr. couver, to hatch, Lat. cubare, to lie down), a custom so called in Béarn, prevalent among several peoples in different parts of the world, requiring that the father, husband and sometimes before the birth of his child, shall remain in bed as fast as or abstain from certain kinds of food, receiving the attentions generally shown to women at their confinements. The existence of the custom in ancient classical times is testified to by Apollonius Rhodius, Diodorus (who refers to its existence among the Corses), and Strabo (who noticed it among the Spanish Basques, by whom, as well as by the Gascons, it has been said to be still observed, though the most recent researches entirely discredit this). Travellers, from the time of Marco Polo, who relates its observance in Chinese Turkestan, have found the custom to prevail in China, India, Borneo, Siam, Africa and the Americas. Even in Europe it cannot be said to have entirely disappeared. In certain of the Baltic provinces of Russia the husband, on the lying-in of the wife, takes to his bed and groans in mock pain. One writer believes he found traces of
it in the little island of Marken in the Zuyder Zee. Even in rural England, notably in East Anglia, a curiously obstinate belief survives (the prevalence of which in earlier times is proved by references to it in Elizabethan drama) that the pregnancy of the woman affects the man, and the young husband who complains of a toothache is assailed by plesantries as to his wife's condition. In Guiana the custom is observed in its most typical form. The woman works to within a few hours of the birth, but some days before her delivery the father leaves his occupations and abstains from certain kinds of animal food lest the child should suffer. Thus the flesh of the agouti is forbidden, lest the child should be lean, and that of the capibara or water-cavy, for fear he should inherit through his father's gluttony that creature's projecting teeth. A few hours before delivery the woman goes alone, or with one or two women-friends, into the forest, where the baby is born. She returns as soon as she can stand to her work, and the man then takes to his hammock and becomes the invalid. He must do no work, must touch no weapons, is forbidden all meat and food, except at first a fermented liquor and after the twelfth day a weak gruel of cassara meal. He must not even smoke, or wash himself, but is waited on hand and foot by the women. So far is the comedy carried that he-whines and groans as if in actual pain. Six weeks after the birth of the child he is taken in hand by his relatives, who lacerate his skin and rub him with a decoction of the pepper-plant. A banquet is then held from which the patient is excluded, for he must not leave his bed till several days later; and for six months he must eat the flesh of neither fish nor bird. Almost identical ceremonies have been noticed among the natives of California and New Mexico; while in Greenland and Kamchatka the husband may not work for some time before and after his wife's confinement. Among the Larkas of Bengal a period of isolation and uncanniness, synchronous with that compulsory on the woman, is imperative for the man, on the conclusion of which the child's parentage is publicly proclaimed.

No certain explanation can be offered for the custom. The most reasonable view is that adopted by E. B. Tylor, who traces it in it the transition from the earlier matriarchal to the later patriarchal system of tribe-organization. Among primitive tribes, and probably in all ages, the former order of society, in which descent and inheritance are reckoned through the mother alone, as being the earliest form of family life, is and was very common, if not universal. The acknowledgment of a relationship between father and son is characteristic of the progress of society towards a true family life. It may well be that the Covadave arose in the father's desire to emphasize the bond of blood between himself and his child. It is a fact that in some countries the father has to purchase the child from its mother; and in the Roman ceremony of the husband raising the baby from the floor we may trace the savage idea that the male parent must formally proclaim his adoption of and responsibility for the offspring. Max Müller, in his Chips from a German Workshop, endeavoured to find an explanation in primitive "heave-picking," asserting that "it is natural to suppose that the father of a child born after his female relatives and afterwards frightened into superstition,"—that, in fact, the whole fabric of ceremony is reared on nothing but masculine hysteria; but this theory can scarcely be seriously. The missionary, Joseph François Laffait, suspected a psychological reason, assuming the custom to be a dim recollection of original sin, the isolation and fast types of repentance. The explanation of the American Indians is that if the father engaged in any hard or hazard work, e.g. hunting, or was careless in his diet, the child would suffer and inherit the physical faults and peculiarities of the animals eaten. This belief that a person becomes possessed of the nature and form of the animal he eats is widespread, being as prevalent in the Old World as in the New, but it is insufficient to account for the minute ceremonial details of La Couvade as practised in many lands. It is far more likely that the same general rule has no trivial beginnings, but is to be considered as a mile-stone marking a great transitional epoch in human progress.

COVE, a word mostly used in the sense of a small inlet or sheltered bay in a coast-line. In English dialect usage it is also applied to a cave or to a recess in a mountain-side. The word in O. Eng. is coa, and cognate forms are found in the Ger. Koben, Norwegian kove, and in various forms in other Teutonic languages. It has no connexion with "alcove," recess in a room or building, which is derived through the Span. alcoba from Arab. al, the, and qubbah, vault, arch, nor with "cub" or "coop," nor with "cave" (Lat. cave). The use of the word was first confined to a small chamber or cell or inner recess in a room or building. From this has come the particular application in architecture to any kind of concave moulding, the term being usually applied to the quadrangular curve rising from the cornice of a lofty room to the moulded borders of the horizontal ceiling. The term "coving" is given in half-timbered work to the curved soft fit under a projecting window, or in the 18th century to that occasionally found carrying the gutter of a house. In the Musée Plantin at Antwerp the hearth of the fireplace of the upper floor is carved on coving, which forms part of the design of the chimney-piece in the room below. The slang use of "cove" for any male person, like a "fellow," "chap," &c, is found in the form "côle" in T. Harman's Coveat for Cursetors (1587) and other early quotations. This seems to be identical with the Scots word "cöl," a pedlar, hawk, which is formed from "cöff," to sell, purchase, cognate with the Ger. kaufen, to buy, and the native English "cheap." The word "cove," therefore, is in ultimate origin the same as "chap," short for "chaplain," a pedlar.

COVELLITE, a mineral species consisting of cupric sulphide, CuS, crystallizing in the hexagonal system. It is of less frequent occurrence in nature than copper-glace, the orthorhombic cuprous sulphide. Crystals are very rare, the mineral being usually found as compact and earthy masses or as a blue coating on other copper sulphides. Hardness 1½-2; specific gravity 4½. The dark indigo-blue colour is a characteristic feature, and the mineral was early known as indigo-copper (Ger. Kupferindig). The name covellite is taken from N. Covelli, who in 1839 observed crystals of cupric sulphide encrusting Vesuvian lava, the mineral having been formed here by the interaction of hydrogen sulphide and cupric chloride, both of which are volatile volcanic products. Covellite is, however, more commonly found in copper-bearing veins, where it has resulted from the alteration of other copper sulphides, namely chalcopryite, copper-glace and erubescite. It is found in many copper mines; localities which may be specially mentioned are Sangerhausen in Prussian Saxony, Banne in Montana, and in the Middle and Lower Mountains of Wyoming a platiniferous covellite is mined, the platinum being present as sperrylite (platinum arsenide). (L. T.)

COVENANT (an O. Fr. form, later convenant, from convenir, to agree, Lat. convenire), a mutual agreement of two or more parties, or an undertaking made by one of the parties. In the Bible the Hebrew word בְּרִית, bérith, is used widely for many kinds of agreements; it is then applied to a contract between two persons or to a treaty between two nations, such as the covenant made between Abimelech and Isaac, representing a treaty between the Israelites and the Philistines (Gen. xxvii. 26 seq.); more particularly to an engagement made between God and men, or such agreements as, by the observance of a religious rite, regarded God as a party to the engagement. Two suggestions have been made for the derivation of bérith: (1) tracing the word from a root to cut, and the reference is to the primitive rite of cutting victims into parts, between which the parties to an agreement passed, cf. the Greek ἱματία, and the account (Gen. xv. 17) of the covenant between God and Abraham, where "a smoking furnace and burning lamp passed
between the pieces" of the victims Abraham had sacrificed; (2) connecting it with an Assyrio-Babylonian *biru* letter, alliance. Be**r**uth was translated in the Septuagint by *baaben* which, in classical Greek had the meaning of "will"; hence the Vulgate, in the Psalms and the New Testament, translates the word by *testamentum*, but elsewhere in the Old Testament by *foedus or pactum*; similarly Wycliffe's version gives "testament" and "covenant" respectively. The books of Scripture dealing with the old or Mosaic, and new or Christian dispensation are sometimes known as the Books of the Old and the New Covenant. The word appears in the system of theology developed by Johannes Cocceius (*q.v*., and known as the "Covenant" or "Federal" Theology, based on the two Covenants of Works or Life made by God with Adam, on condition of obedience, and of grace or redemption, made with Christ. In Scottish ecclesiastical history, covenant appears in the two agreements signed by the members of the Scottish Church in defence of their religious and ecclesiastical systems (see COVENANTERS).

**COVENANT**, in law, is the English equivalent of the Lat. *conventio*, which, although not technical, was the most general word in Roman law for "agreement." It was frequently used along with *pactum* also a general term, but applied especially to agreements to settle a question without carrying it before the courts of law.

The word "covenant" has been used in a variety of senses in English law.

1. In its strict sense, covenant means an agreement under seal, that something has or has not already been done, or shall or shall not be done hereafter (Shap. Touchstone, 160, 162). It is most commonly used with reference to sales or leases of land, but is sometimes applied to any promise or stipulation, whether under seal or not. The person who makes, and is bound to perform, the promise or stipulation is the covenantor: the person in whose favour it is made is the covenantee.

2. Covenants have been subdivided into numerous classes, only a few of which need to be described. It is unnecessary to do more than mention affirmative and negative covenants, joint or several, alternative or disjointive covenants, dependent or independent covenants. As to collateral covenants, covenants "running with the land," and covenants in leases (including "usual", "proper" and "restrictive" covenants), see LASSOED AND TENANTED. But there are other classes as to which something must be said.

A covenant is said to be express when it is created by the express words of the parties to the deed declaratory of their intention. It is not indispensable that the word "covenant" should be used. Any word which clearly indicates the intention of the parties to covenant will suffice. An implied covenant, or covenant in law, "depends for its existence on the intention and construction of law. There are some words which of themselves do not import an express covenant, yet, being made use of in certain contracts, have a similar operation and are called covenants in law; and they are as effectually binding on the parties as if expressed in the most unequivocal terms" (Platt on *Covenants*, p. 40). Thus, the word "demise," used in a lease of deed, raises the implication of a covenant both for "quiet enjoyment" and for title to let; and it has been judicially suggested that a covenant for quiet enjoyment may be implied from any word or words of like import (Budd-Scott *v. Dandie*, 1902, 2 K.B. p. 359). The Conveyancing Act 1881 provides (§ 7) that "a covenant for valuable consideration, other than a mortgage, there shall be implied, as against the person who conveys and is expressed to convey as "beneficial owner," certain qualified covenants—*i.e.* covenants extending only to the acts or omissions of the vendor, persons through whom he derives title otherwise than by purchase for value, and persons claiming under them—for "right to convey," "quiet enjoyment," "freedom from incumbrances" and "further assurance." Of these statutory covenants for title the only one which requires explanation is the covenant for further assurance. It imports an agreement on the part of the covenantor to do such reasonable acts, in addition to those already performed, as may be necessary for the completion of the transfer made (or intended to be made) at the requirements of the covenantor (Platt on *Covenants*, p. 341).

All these statutory implied covenants are "run with the land." (see LANDLORD AND TENANT). Where a mortgagee conveys, and is expressed to convey, as "beneficial owner," there are implied absolute covenants—*i.e.* covenants amounting to a warranty against and for the acts and omissions of the whole world—that he has a right to convey, that the mortgagee shall have quiet enjoyment of the property after default, free from incumbrances and for further assurance. Special provisions as to implied covenants by the lessor in leases are made in England by § 7 (B) of the Conveyancing Act 1881 and in Ireland by the Land Act (Ireland) 1860, § 41. The distinction between real and personal covenants is that the former do, while the latter do not, run with the land. An inherent covenant is another name for a real covenant (Shap. Touchstone, 176; Platt, 60). When a covenant relates to an act already done, it is usually termed a covenant executed; where the performance is future, the covenant is termed executory. The covenant for seisin was an assurance to the grantee that the grantor had the estate which he purported to convey. In England it is now included in the covenant for right to convey; but is still in separate use in Tasmania for Title (Boston). The covenant to stand seised to uses was an assurance by means of which, under the Statute of Uses [1536] (see Uses), a conveyance of an estate might be effected. When such a covenant is made, the legal estate in the land passes at once to the covenantee under the statute. The consideration for the covenant must be relationship by blood or marriage. It is still occasionally though very rarely employed. The covenant not to sue belongs to the law of contract and needs no explanation.

Most of the classes of covenants above mentioned are in use in the United States. In New York, Michigan, Minnesota, Oregon, Wisconsin, Texas, and Wyoming the title by covenant deed has been, with certain exceptions, prohibited by statute. In Alabama, Arkansas, Delaware, Illinois, Indiana, Mississippi, Missouri, Montana, Nevada, New Mexico, Pennsylvania and Texas the words grant, bargain and sell, in conveyances in fee, unless specially restricted, amount to qualified covenants that the grantor was seised in fee, free from incumbrances, and for quiet enjoyment (4 Kent, *Commentaries*, § 473; Bouvier, *Law Dictionary*, s.v. Covenant). In some of the states a covenant of non-claim, or of warranty, an assurance by the grantor that neither be his heirs, nor any other person shall claim any title in the premises conveyed, is in general use.

3. An action of covenant lay for breaking covenant. As to the history of this action see Pollock and Maitland, *History of English Law*, ii. 166; and Holmes, *The Common Law*, p. 272. There was also a writ of covenant. But this remedy had fallen into disuse before 1830 (see Platt on *Covenants*, p. 543), and was abolished by the Common Law Procedure Acts. Since the Judicature Acts, an action on a covenant follows the same course as, and is indistinguishable from, any ordinary action for breach of contract. The remedy is by damages, decree of specific performance or injunction to prevent the breach.

The term "covenant" is unknown to Scots law. But its place is filled to some extent by the doctrine of "warrantance." Many of the British colonies have legislated, as to the implication of covenants for title, on the lines of the English Conveyancing Act 1881, e.g. Tasmania, Conveyancing and Land Property Act 1884 (47 Vict. No. 10).

As to covenants in restraint of trade see RESTRAINT.

**COVENANTERS**, the name given to a party which, originating in the Reformation movement, played an important part in the history of Scotland, and to a lesser extent in that of England, during the 17th century. The Covenanters were thus named because in a series of bands or covenants they bound themselves to maintain the Presbyterian doctrine and polity as the sole religion of their country. The first "godly band" is dated December 1557; but more important is the covenant of 1581, drawn up by John Craig in consequence of the strenuous efforts
COVENT GARDEN—COVENTRY, LORD

which the Roman Catholics were making to regain their hold upon Scotland, and called the King's Confession or National Covenant. Based upon the Confession of Faith of 1560, this document denounced the pope and the doctrines of the Roman Catholic Church in no measured terms. It was adopted by the General Assembly, signed by King James VI. and his household, and enjoined on persons of all ranks and classes; and was again subscribed in 1590 and 1596. In 1637 Scotland was in a state of turmoil. Charles I. and Archbishop Laud had just met with a reverse in their efforts to impose the English liturgy upon the Scots; and fearing further measures on the part of the king, it occurred to Archibald Johnston, Lord Warriston, to revive the National Covenant of 1581. Additional matter intended to suit the document to the special circumstances of the time was added, and the covenant was adopted and signed by a large gathering in Greyfriars' churchyard, Edinburgh, on the 28th of February 1638, after which copies were sent throughout the country for additional signatures. The subscribers engaged by oath to maintain religion in the state in which it existed in 1580, and to reject all innovations introduced since that time, while professed expressions of loyalty to the king were added. The Government in power was displeased, and a proclamation was issued in 1638, declaring war against all Covenanters, and in 1640 the covenant was adopted by the parliament, and its subscription was required from all citizens. Before this date the Covenanters were usually referred to as Suppliants, but from about this time the former designation began to prevail.

A further development took place in 1643. The leaders of the English parliament, worsted in the Civil War, implored the aid of the Scots, which was promised on condition that the Scottish system of church government was adopted in England. After some haggling a document called the Solemn League and Covenant was drawn up. This was practically a treaty between England and Scotland for the preservation of the reformed religion in Scotland, the reformation of religion in England and Ireland "according to the word of God and the example of the best reformed churches," and the extirpation of popery and prelacy. It was subscribed by many in both kingdoms and also in Ireland, and was approved by the English parliament, and with some slight modifications by the Westminster Assembly of Divines. Charles II. refused to accept it when he surrendered himself to the Scots in 1646, but he made important concessions in this direction in the "Engagement" made with the Scots in December 1647. Charles II. before landing in Scotland in June 1650 declared by a solemn oath his approbation of both covenants, and this was renewed on the occasion of his coronation at Scone in the following January.

From 1638 to 1651 the Covenanters were the dominant party in Scotland, directing her policy both at home and abroad. Their power, however, which had been seriously weakened by Cromwell's victory at Dunbar in September 1651, was practically destroyed when Charles II. was restored nine years later. Firmly seated upon the throne Charles renounced the covenants, which in 1662 were declared unlawful oaths, and were to be abjured by all persons holding public offices. Episcopacy was restored, the court of high commission was revived, and ministers who refused to recognize the authority of the bishops were expelled from their livings. Gathering around them many of the Covenanters who clung tenaciously to their standards of faith, these ministers began to preach in the fields, and a period of persecution marked by savage hatred and great brutality began. Further oppressive measures were directed against the Covenanters, who took up arms about 1665, and the struggle soon assumed the proportions of a rebellion. The forces of the crown under John Graham of Cleaverhouse and others were sent against them, and although the insurgents gained isolated successes, in general they were worsted and were treated with great barbarity. They maintained, however, their cherished covenants with a zeal which persecution only intensified; in 1680 the more extreme members of the party signed a document known as the "Sanquhar Declaration," and were afterwards called Cameronians from the name of their leader, Richard Cameron (q.v.). They renounced their allegiance to King James and were greatly disappointed when their standards found no place in the religious settlement of 1689, continuing to hold the belief that the covenants should be made obligatory upon the entire nation. The Covenanters had a martyrlogy of their own, and the halo of romance has been cast around their exploits and their sufferings. Their story, however, especially during the time of their political predominance, is part of the general history of Scotland (q.v.).

The texts of the National Covenant and the Solemn League and Covenant are printed in S. R. Gardiner's Constitutional Documents of the Puritan Revolution (Oxford, 1899). See also J. H. Burton, History of Scotland (Edinburgh, 1905); A. Lang, History of Scotland (Edinburgh, 1900); S. R. Gardiner, History of England (London, 1883-1884); G. Grub, Ecclesiastical History of Scotland (Edinburgh, 1861); J. Macpherson, History of the Church in Scotland (Paisley, 1901); and J. K. Hewison, The Covenanters (1908).
opening of parliament in 1628 he threatened that the king would use his prerogative if further thwarted in the matter of supply. In the subsequent debate, however, while strongly supporting the king's prerogative against the claims of the parliament to executive power, he favoured a policy of moderation and compromise. He defended the right of the council to commit to prison without showing cause, and to issue "general" warrants; though he allowed it should only be employed in special circumstances, disapproved of the king's sudden dissolution of parliament, and agreed to the liberation on bail of the seven imprisoned members on condition of their giving security for their good behaviour. He showed less subservience than Bacon to Buckingham, and his resistance to the latter's pretensions to the office of lord high constable greatly incensed the duke. Buckingham taunted Coventry with having gained his place by his favour; to which the lord keeper replied, "Did I conceive I had my place by your favour, I would presently unmake myself by returning the seal to his Majesty." 1 After this defiance Buckingham's sudden death alone probably prevented Coventry's displacement. He passed sentence of death on Lord Audley in 1631, disdained and enforced the proclamation of the 20th of June ordering the country gentlemen to leave London, and in 1634 joined in Laud's attack on the earl of Portland for peculation. The same year, in an address to the judges, he supported the proposed levy of ship-money on the inland as well as the maritime counties on the plea of the necessity of effectually arming, "so that they might not be enforced to fight," "the wooden walls" being in his opinion "the best walls of this kingdom." 2 In the Star Chamber Coventry was one of Lilburne's judges in 1637, but he generally showed conspicuous moderation, inclining to leniency in the cases of Richard Charmers in 1629 for seditious speeches, and of Henry Sherfield in 1632 for breaking painted glass in a church. He prevented also the hinging of men for resistance to imprisonment, and pointed out its illegality, since the men were not subject to martial law. While contributing thirty horse to the Scottish expedition in 1638, and lending the king £10,000 in 1639, he gave no support to the forced loan levied upon the city in the latter year. He died on the 14th of January 1640.

Lord Coventry held the great seal for nearly fifteen years, and was enabled to collect a large fortune. He was an able judge, and he issued some important orders in chancery, probably alluded to by Wood, who ascribes to him a tract on "The Fees of all Law Officers." 3 Whitelocke accuses him of mediocrity, 4 but his contemporaries in general have united in extolling his judicial ability, his quick dispatch of business and his sound and sterling character. Clarendon in particular praises his statesmanship, and compares his capacity with Lord Strafford's, adding, however, that he seldom spoke in the council except on legal business and had little influence in political affairs; to the latter circumstance he owed his exceptional popularity. He describes him as having "in the plain way of speaking and delivery a strange power of making himself believed," as a man of "not only firm gravity but a severity and even some morosity," as "rather exceedingly liked than passionately loved." 5

Lord Coventry married (1) Sarah, daughter of Sir Edward Sackville of Bessford in Worcestershire, by whom besides a daughter he had one son, Thomas, who succeeded him as 2nd baron, and (2) Elizabeth, daughter of John Aldersley of Spurstow, Cheshire, and widow of William Pitchford, by whom he had four sons, John, Francis, Henry and Sir William Coventry, the statesman.

Thomas Coventry, 5th baron (d. 1699), was created an earl in 1607 with a special limitation, on failure of his own male issue, to that of Walter, youngest brother of the lord keeper, from whom the present earl of Coventry is descended.

COVENTRY, SIR WILLIAM (c. 1628-1686), English statesman, son of the lord keeper, Thomas, Lord Coventry, by his second wife Elizabeth Aldersley, was born about 1628. He matriculated at Queen's College, Oxford, at the age of fourteen. Owing to the outbreak of the Civil War he was obliged to quit his studies, but according to Sir John Bramston he "had a good tutor who made him a scholar, and he travelled and got the French language in good perfection." "He was young whilst the war continued," wrote Clarendon, "yet he had put himself before the end of it into the army and had the command of a foot company and shortly after travelled into France." Here he remained till all hopes of obtaining foreign assistance and of raising a new army had to be laid aside, when he returned to England and kept aloof from the various royalist intrigues. When, however, a new prospect of a restoration appeared in 1660, Coventry hastened to Breda, was appointed secretary to James, duke of York, lord high admiral of England, and headed the royal procession when Charles entered London in triumph.

He was returned to the Restoration parliament of 1661 for Great Yarmouth, became commissioner for the navy in May 1662 and in 1663 was made D.C.L. at Oxford. His great talents were very soon recognized in parliament, and his influence as an officer was condescended to by the king. His appointment was rather that of secretary to the admiralty than of the navy, which was in the hands of York, 6 and was one of large gains. Wood states that he collected a fortune of £60,000. Accusations of corruption in his naval administration, and especially during the Dutch war, were brought against him, but there is nothing to show that he ever transgressed the limits sanctioned by usage and custom in obtaining his emoluments. Pepys in his diary invariably testifies to the excellence of his administration and to his zeal for reform and economy. His ability and energy, however, did little to avert the naval collapse, owing chiefly to financial mismanagement and to the ill-advised appointments to command. Coventry denied all responsibility for the Dutch War in 1665, which Clarendon sought to place upon his shoulders, and his repudiation is supported by Pepys; it was, moreover, contrary to his well-known political opinion. The war greatly increased his influence, and shortly after the victory off Lowestoft, on the 3rd of June 1665, he was knighted and made a privy councilor (6th of June) and was subsequently admitted to the committee on foreign affairs. In 1667 he was appointed to the board of treasury to effect financial reforms. "I perceive," writes Pepys on the 23rd of August 1667, "Sir William Coventry is the man and nothing done till he comes," and on his removal in 1669 the duke of Albemarle, no friendly or partial critic, declares that "nothing now would be well done." His appointment, however, came too late to ward off the naval disaster at Chatham the same year and the national bankruptcy in 1672.

Meanwhile Coventry's rising influence had been from the first the cause of increasing jealousy to the old chancellor Clarendon, who especially disliked and discouraged the younger generation. Coventry resented this repression and thought ill of the conduct of the administration. He became the chief mover in the successful attack made upon Clarendon, but refused to take any part in his impeachment. Two days after Clarendon's resignation (on the 31st of August), Coventry announced his intention of leaving the duke's service and of terminating his connection with the navy. 7 As the principal agent in effecting Clarendon's fall he naturally acquired new power and influence, and the general opinion pointed to him as his successor as first minister of the crown. Personal merit, patriotism and conspicuous ability, however, were poor passports to place and power in Charles II.'s reign. Coventry retained merely his appointment at the treasury, and the brilliant but unscrupulous and incapable duke of Buckingham, a favourite of the king, succeeded to Lord Clarendon. The relations between the two men soon became unfriendly. Buckingham ridiculed Sir William's steady attention to business, and was annoyed at his opposition to Clarendon's impeachment. Coventry rapidly lost influence, was excluded from the cabinet council, and six months after Clarendon's fall complains he has scarcely a friend at court. Finally, in March

3 Ath. Oxon. ii. 650.
4 There is an adverse opinion also expressed in Pepys's Diary, August 26, 1666, probably based on little real knowledge.
COVENTRY

1669, Buckingham having written a play in which Sir William was ridiculed, the latter sent him a challenge. Notice of the challenge reached the authorities through the duke's second, and Sir William was imprisoned in the Tower on the 3rd of March, and subsequently expelled from the privy council. He was superseded in the treasury on the 11th of March by Buckingham's favourite, Sir Thomas Osborne, afterwards earl of Danby and duke of Leeds, and was at last released from the Tower on the 21st in disgrace. The real cause of his dismissal was clearly the final adoption by Charles of the policy of subservience to France and desertion of Holland and Protestant interests. Six weeks before Coventry's fall, the conference between Charles, James, Arlington, Clifford and Arundel had taken place, which resulted a year and a half later in the disgraceful treaty of Dover. To such schemes Sir William, with his steady hostility to France and active devotion to Protestantism, was doubtless a formidable opponent. He now withdrew definitely from official life, still retaining, however, his ascendancy in the House of Commons, and leading the party which condemned and criticized the reactionary and fatal policy of the government, his credit and reputation being rather enhanced than diminished by his dismissal.

In 1673 was published a pamphlet written in the king's name, entitled England's appeal from the Private Cabal at Whitehall to the Great Council of the Nation . . . by a true Lover of his Country, an anonymous work universally ascribed to Sir William, which forcibly reflects his opinions on the French entanglement. In the great matter of the Indulgence, while refusing to discuss the limits of prerogative and liberty, he argued that the dispensing power of the crown could not be valid during the session of parliament, and criticized the manner of the declaration while approving its ostensible object. He supported the Test Act, but maintained a statesmanlike moderation amidst the tide of indignation rising against the government, and refused to take part in the personal attacks upon ministers, drawing upon himself the same unpopularity as his nephew Halifax incurred later. In the same year he warmly denounced the alliance with France. During the summer of 1674 he was again received at court. In 1675 he supported the bill to exclude Roman Catholics from both Houses, and also the measure to close the House of Commons to placemen; and he showed great activity in his opposition to the French connection, especially after his return from the settlement of the treaty of Münster, which involved the loan of troops for the French service. In May 1677 he voted for the Dutch alliance. Like most of his contemporaries he accepted the story of the popish plot in 1678. Coventry several times refused the highest court appointments, and he was not included in Sir W. Temple's new-modelled council in April 1679. In the exclusion question he favoured at first a policy of limitations, and on his nephew Halifax, who on his retirement became the leader of the moderate party, he enjoined prudence and patience, and greatly regretted the violence of the opposition which eventually excited a reaction and ruined everything. He refused to stand for the new parliament, and retired to his country residence at Minster Lovell near Witney, in Oxfordshire. He died unmarried on the 23rd of June 1686, at Somerhill near Tunbridge Wells, where he had gone to take the waters, and was buried at Penshurst, where a monument was erected to his memory. In his will he ordered his funeral to be at small expense, and left £3000 to the French Protestant refugees in England, besides £3000 for the liberation of captives in Algiers. He had shortly before his death already paid for the liberation of Sir John Danby and of the Viscount Danby, who were imprisoned since the death of his nephew, Henry Savile, alluding to him in affectionate terms as "our dearest uncle" and "incomparable friend." Though Sir William Coventry never filled that place in the national administration to which his merit and exceptional ability clearly entitled him, his public life together with his correspondence are sufficient to distinguish him from amongst his contemporaries as a statesman of the first rank. Lord Halifax obviously derived from his honoured mentor those principles of government which, by means of his own brilliant intellectual gifts, originality and imaginative insight, gained further force and influence. Halifax devoted to him his interest in the navy and his grasp of the necessity of a powerful maritime force. He drew his antagonism to France, his religious tolerance, wide religious views but firm Protestantism, doubtless from the same source. Sir William was the original "Trimmer." Writing to his nephew Viscount Weymouth, while denying the authorship of The Character of a Trimmer, he says:—"I have not been ashamed to own myself to be a trimer . . . one who would sit upright and not overturn the boat by swaying too much to either side." He shared the Trimmer's dislike of party, urging Halifax in the exclusion contest "not to be thrust by the opposition of his enemies into another party, but that he keep upon a national bottom which at length will prevail." His prudence is expressed in his "perpetual unwillingness to do things which I cannot undo." "A singular independence of spirit, a breadth of mind which refused to be contracted by party formulas, a sanity which was proof against the contagion of national delirium, were equally characteristic of uncle and nephew." Sir William Coventry's conceptions of statesmanship, under the guiding hand of his nephew, largely inspired the future revolution settlement, and conceived to be an essential condition of English political growth and progress.

Besides the tract already mentioned Coventry was the author of A Letter to Dr Burnet giving an Account of Cardinal Poole's Secret Powers . . . (1685). The Character of a Trimmer, often ascribed to him, is now known to have been written by Lord Halifax. "Notes concerning the Poor," and an essay "concerning the decay of rents and the remedy," are among the Malet Papers (Hist. MSS. Comm. 3rd Rep. app. 320 (a) and Add. MSS. Brit. Mus. (cal. 1882-1887); an "Essay concerning France" (4th Rep. app. 229 (b)) and a "Discourse on the Management of the Navy" (320b) are among the MSS. of the marquess of Bath, also a catalogue of his library (323a)."

BIBLIOGRAPHY.—No adequate life of Sir William Coventry has been written; the most satisfactory appreciation of his character and abilities is to be found in the several passages relating to him in the Life of George Savile, Marquis of Halifax, by Miss A. C. Foxcroft (1868); see also Hist. MSS. Comm. 3 and 4 Rep. (Longleat), 5 Rep. (Malet Collection and see Index) now in the Brit. Mus. add. Cal. (1856-1887), some of his papers being also at Devonshire House; MSS. of Marquis of Ormond, iii. of J. M. Heathcote and Miscellaneous Collections; Clarendon's Life and Continuation (Oxford, 1857); Calendar of Clarendon Papers; Burnet's Hist. of the Dutch War (Oxford, 1854), Add. Misc. Cal. (170), chap. xi.; John Evelyn's Memoirs; Pepys's Diary and Pettysiana (ed. H. B. Wheatley, 1903); Calendar of State Papers, Domestic; Savile Correspondence (Camden Society, 1834, vol. liii.); A. Grey's Debates; Sir John Bramston's Autobiography (Camden Society, 1845); Wood's Athenae Oxonienses, iv. 190; Saturday Review (Oct. 4, 1873).

COVENTRY, a municipal, county and parliamentary borough of Warwickshire, England; 94 m. N.W. from London by the London & North Western railway. Pop. (1901) 69,078. The Coventry canal communicates with the Trent and Mersey and Birmingham canals, and the midland system generally. Coventry stands on a gentle eminence, with higher ground lying to the west, and is watered by the Sherbourne and the Radford Brook, feeders of the Avon, which unite within the town. Of its ancient fortifications two gates and some portions of the wall are still extant, and several of the older streets are picturesque from the number of half-timbered houses projecting over the footways. The most remarkable of the churches, of which the oldest are St Michael's, one of the finest examples of Perpendicular architecture in England, with a beautiful steeple rising to a height of 303 ft.; Holy Trinity church, a cruciform structure with a lofty steeple at the intersection; and St John's, or Bablake church, which is nearly a parallelogram on the ground plan, but cruciform in the clerestory with a central tower. Christ church dates only from 1832, but it is attached to the ancient spire of the Grey Friars' church. Of secular buildings the most interesting is St Mary's hall, erected by the united gilds in the early part of the 15th century. The principal chamber,
situated above a fine crypt, is 76 ft. long, 30 ft. wide and 34 ft. high; its roof is of carved oak, and in the north end there is a large window of old stained glass, with a curious piece of tapestry beneath nearly as old as the building. In the treasury is preserved a valuable collection of ancient muniments. A statue of Sir Thomas White, lord mayor of London (1532–1533), founder of St John’s College, Oxford, was erected in 1883. The cemetery, laid out by Sir Joseph Paxton, the architect and landscape gardener, and enlarged in 1887, is particularly beautiful. The educational institutions include a well-endowed free grammar school, founded in the reign of Elizabeth, in modern buildings (1885), a technical school, school of art, endowed charity schools, and a county reformatory for girls; and among the charitable foundations, which are numerous and valuable, Bond’s hospital for old men and Ford’s hospital for old women are remarkable as fine specimens of ancient timber work. Swanswell and Spenser Parks were opened in 1883, and a recreation ground in 1880.

Coventry was formerly noted for its woolens, and subsequently acquired such a reputation for its dyeing that the expression “as true as Coventry blue” became proverbial. Existing industries are the making of motor cars, cycles and their accessories, for which Coventry is one of the chief centres in Great Britain. Sewing machines are also produced. The potteries, weaving and dyeing art, metal working and watch making are carried on. An ancient fair is held in Whit-week. A county of itself till 1843, the town became a county borough in 1888. The corporation consists of a mayor, 10 aldermen and 30 councillors. The parliamentary borough returns one member. In 1884 a suffragan bishopric of Coventry was established under the see of Worchester, but no longer exists.

Area, 4,149 acres.

The village which afterwards became important as Coventry (Coventre, Covent) owed its existence to the foundation of a Benedictine monastery by Earl Leofric and his wife Godgyfu, the famous lady Godiva (q.v.), in 1043. The manor, which in 1066 belonged to the latter, descended to the earls of Chester and to Robert de Montalt, and from him passed to Isabella queen of Edward II. and the crown. Ranulf, earl of Chester, granted the earliest extant charter to the town in 1155, by which his burgesses were to hold him in free burgage as they held of his father, and to have their portmote. This, with further privileges, was confirmed by Henry II. in 1177, and by nearly every succeeding sovereign. In the reign of Edward III. Coventry was a corporation, mayor and bailiffs empowered to hold pleas and keep the town prison. Edward the Black Prince granted the mayor and bailiffs the right to hold the town in fee farm of £50 and to build a wall. In 1452 Henry VI. formed the city and surrounding hamlets into a county, and James I. incorporated Coventry in 1622. It first sent two representatives to parliament in 1295, but the returns were irregular. The prior’s market on Fridays was probably of Saxon origin; a second market was granted in 1348, while fairs, still held, were obtained in 1271 for the octave of Holy Trinity, and in 1348 and in 1442 for eight days from the Friday after Corpus Christi. As early as 1216 Coventry was important for its trade in wool, cloth and caps, its gilds later being particularly numerous and wealthy. In 1568 Flemish weavers introduced new methods, but the trade was destroyed in the wars of the 17th century. During the middle of the 16th century there was a flourishing manufacture of blue thread, but this decayed before 1581; in the 18th century the manufacture of ribbon was introduced.

The popular phrase “to send to Coventry” (i.e. to refuse to associate with a person) is of uncertain derivation. The New English Dictionary selects the period of the Civil War of the 17th century as that in which the origin of the phrase is probably to be found. Clarendon (History of the Great Rebellion, 1647) states that the citizens of Birmingham rose against certain small parties of the king’s supporters, and sent the prisoners they captured to Coventry, which was then strongly parliamentarian.

The title of the dictionary is derived from a sepulchre in the old church of St. Michael, Coventry (now at Stoneleigh Abbey, Warwickshire), which was opened in 1866. The word “cover” is also derived from the Latin “capere”, and the word is used in the same sense as “cap” in Latin, and in English as the name of a shelter or covering for a person or thing. The term “cover” is also used in the sense of a place for shelter, and is applied to various forms of temporary protection.

For a time Coventry lived at Tübingen, where he was created
D.D. In 1545 he was pastor and schoolmaster at Bergzabern in the duchy of Pfalz-Zweibrücken. In March 1548 he was at Frankfurt, when the new English Order of Communion reached him; he at once translated it into German and Latin and sent a copy to Calvin, whose wife befriended Coverdale at Strassburg. Calvin, however, does not seem to have approved of it so highly as Coverdale.

Coverdale was already on his way back to England, and in October 1548 he was staying at Windsor Castle, where Cranmer and some other divines, inaccurately called the Windsor Commission, were preparing the First Book of Common Prayer. His first appointment had been as almoner to Queen Catherine Parr, then wife of Lord Seymour; and he preached her funeral sermon in September 1548. He was also chaplain to the young king and took an active part in the reforming measures of his reign. He was one of the most effective preachers of the time. A sermon by him at St Paul’s on the second Sunday in Lent, 1549, was immediately followed by the pulling down of “the sacrament at the high altar.” A few weeks later he preached at the penance of some Anabaptists, and in January 1550 he was put on a commission to prosecute Anabaptists and all who infringed the Book of Common Prayer. In 1549 he wrote a dedication to Edward for a translation of the second volume of Erasmus’s Paraphrases; and in 1550 he translated Otto Wermueller’s Precious Pearl, for which Protector Somerset, who had derived spiritual comfort from the book while in the Tower, wrote a preface. He was much in request at funerals: he preached at Sir James Wilford’s in November 1550, and at Lord Wentworth’s before a great concourse in Westminster Abbey in March 1551.

Perhaps it was his gift of oratory which suggested his appointment as bishop of the refractory men of Devon and Cornwall. He had already, in August 1549, at some risk, gone down with Lord Russell to turn the hearts of the rebels by preaching and persuasion, and two years later he was appointed bishop of Exeter by letters patent, on the compulsory retirement of his predecessor, Veysey, who had reached an almost mythical age. He was an active prelate, and perhaps the vigorous Protestantism of the West in Elizabeth’s reign was partly due to his persuasive powers. He sat on the commission for the reform of the canon law, and was in constant attendance during the parliaments of 1552 and 1553. On Mary’s accession he was at once deprived on the score of his marriage, and Veysey in spite of his age was restored. Coverdale was called before the privy council on the 1st of September, and required to find sureties; but he was not further molested, and when Christian III. of Denmark at the instance of Coverdale’s brother-in-law, MacAlpine, interceded in his favour, he was in February 1555 permitted to leave for Denmark with two servants, and his baggage unsearched; one of these “servants” is said to have been his wife. He declined Christian’s offer of a living in Denmark, and preferred to preach at Welles to the numerous English refugees there, until he was invited by Duke Wolfgang to resume his labours at Bergzabern. He was at Geneva in December 1558, and is said to have participated in the preparation of the Genevan version of the Bible.

In 1559 Coverdale returned to England and resumed his preaching at St Paul’s and elsewhere. Clothed in a plain black gown, he assisted at Parker’s consecration, in spite of the facts that he had himself been deprived, and did not resume his bishopric, and that his original appointment had been by the uncanonical method of letters patent. Conscientious objections were probably responsible for his non-restoration to the see of Exeter, and his refusal of that of Llandaff in 1563. He objected to vestments, and in his living of St Magnus close to London Bridge, which he received in 1563, he took other liberties with the Act of Uniformity. His bishop, Grindal, was his friend, and his vagaries were overlooked until 1566, when he resigned his living rather than conform. He still preached occasionally, and always drew large audiences. He died in February 1568, and was buried on the 19th in St Bartholomew’s behind the Exchange. When this church was pulled down in 1840 to make room for the new Exchange, his remains were removed to St Magnus.

Coverdale’s works, most of them translations, numbered twenty-six in all: nearly all, with his letters, were published in a collected edition by the Parker Soc., 2 vols., 1846. An excellent account is given in the Dict. Nat. Bioj. of his life, with authorities, to which much has been added by R. W. Seton, R. W. Grindal, Bishop and Gasquet’s Edward VI. and the Book of Common Prayer; Acts of the Privy Council; Letters and Papers of Henry VIII.; Lit. Rem. of Edward VI. (Roxburghe Club); Whittingham’s Brief Discourse of Troubles at Frankfurt; Pocock’s Troubles connected with the Prayer Book (Cammed Soc.).

(A. F. P.)

COVERTURE (covert, a covering, an old French form of the modern couverture), a term in English law applied to the condition of a woman during marriage, when she is supposed to be under the cover, influence and protection of her husband, and so immune in certain cases from punishment for crime committed in the presence and on the presumed coercion of his husband. (See further Husband and Wife.)

COVILHÁ, a town of Portugal, in the district of Castello Branco, formerly included in the province of Beira; on the eastern slope of the Serra da Estrella, and on the Abrantes-Guarda railway. Pop. (1900) 15,469. Covilhá, which has been often compared with a collection of swallows’ nests clinging to the rugged granite mountain side, is shaped like an amphitheatre of closely crowded houses, overlooking the river Zêzere and its wild valley from a height of 2180 ft. Over 4000 operatives are employed in the manufacture of saragoça, a coarse brown cloth woven by the peasantry throughout Portugal. The village of Unhaes da Serra (1507), 6 m. W.S.W., is noted for its sulphurous springs and baths.

COVILHÁ (Covilhão, Covilha), PERO or PEDRO DE, Portuguese explorer and diplomatist (fl. 1487-1532), was a native of Covilhá in Beira. In early life he had gone to Castile and entered the service of Alphonso, duke of Seville; later, when war broke out between Castile and Portugal, he returned to his own country, and attached himself, first as a “groom,” then as a “squire,” to King Alphonso V. and his successor John II. On the 7th of May 1487, he was despatched, in company with Alphonso de Payva, on a mission of exploration in the Levant and adjoining regions of Asia and Africa, with the special object of learning where “cinnamon and other spices could be found,” as well as of discovering the land of Prester John, by “overland” routes. Bartholomew Diaz, at this very time, went out to find the Prester’s country, as well as the termination of the African continent and the ocean route to India, by sea. Covilhá and Payva were provided with a “letter of credence for all the countries of the world” and with a “map for navigating, taken from the map of the world” and compiled by Bishop Calcidilha, and doctors Rodrigo and Moyes. The first two of these were prominent members of the commission which advised the Portuguese government to reject the proposals of Columbus. The explorers started from Santarem and travelled by Barcelona to Naples, where their bills of exchange were paid by the sons of Cosimo de’ Medici; thence they passed to Rhodes, where they lodged with two other Portuguese, and so to Alexandria and Cairo, where they posed as merchants. In company with certain Spanish, they went from Fez and Tlemcen they then went by way of Tor to Susakin and Aden, where (as it was now monsoon time) they parted, Covilhá proceeding to India and Payva to Ethiopia—the two companions agreeing to meet again in Cairo. Covilhá thus arrived at Cannarego and Calicut, whence he retraced his course to Goa and Ormuz, the Red Sea and Cairo, making an excursion on his way down the East African coast to Sofala, which he was probably the first European to visit. At Cairo he heard of Payva’s death, and met with two Portuguese Jews—Rabbi Abraham of Beja, and Joseph, a shoe-maker of Lamego—who had been sent by King John with letters for Covilhá and Payva. By Joseph of Lamego Covilhá replied with an account of his Indian and African journeys, and of his observations on the cinnamon, pepper and clove trade at Calicut, together with advice as to the ocean way to India. This he truly represented as quite practicable: “to this they (of Portugal) could navigate by their coast and the seas of Guinea.” The first objective in the eastern ocean, he added, was Sofala or the
Island of the Moon, our Madagascar—" from each of these lands one can fetch the coast of Calicut." With this information Joseph returned to Portugal, while Covilhã, with Abraham of Beja, again visited Aden and Ormuz. At the latter he left the rabbit; and himself came back to Jidda, the port of the Arabian holy land, and penetrated (as he told Alvarez many years later) even to Mecca and Medina. Finally, by Mount Sinai, Tor and the Red Sea, he reached Zeila, whence he struck inland to the court of Prester John (i.e. Abyssinia). Here he was honourably received; lands and lordships were bestowed upon him; but he was not permitted to leave. When the Portuguese embassy under Rodrigo de Lima, including Father Francisco Alvarez, entered Abyssinia in 1520, Covilhã went with joy at the sight of his fellow-countrymen. It was then forty years since he had left Portugal, and after thirty since he had been a prisoner of state in "Ethiopia." Alvarez, who professed to know him well, and to have heard the story of his life, both "in confession and out of it," praises his powers of vivid description "as if things were present before him," and his extraordinary knowledge of "all spoken languages of Christians, Moors and Gentiles." His services as an interpreter were valuable to Rodrigo de Lima's embassy; but he never succeeded in escaping from Abyssinia.

Sea-Francisco Alvarez "Verdaguer y las islas de las terres do Presti Joam," esp. chs. 73, 89, 98, 102-103, 105 (pp. 177, 224, 254, 254, 265-270, 275, of the Hakluyt Society's English edition, The Portuguese Embassy to Abyssinia ... 1320-1727, London, 1881); an abridgment of this, with some inaccuracies, is given in Major's Prince Henry the Navigator (London, 1868), pp. 339-340.

Covin (from the Fr. couvine, or couvine, from Lat. convenire, to come together), an association of persons, so used in the Statute of Labourers of 1360, which, inter alia, declared void "all alliances and covines of masons and carpenters." The more common use of the term in English law was for a secret agreement between persons to cheat and defraud, but the word is now obsolete, and has been superseded by "collusion" or "conspiracy to cheat and defraud." 

Covington, a city and one of the two counties-seats of Kenton county, Kentucky, U.S.A., on the Ohio river opposite Cincinnati, with which it is connected by bridges; and at the mouth of the Licking river (also spanned by bridges), opposite Newport, Ky. Pop. (1890) 37,371; (1900) 42,908, of whom 5223 were foreign-born and 2478 were Negroes; (1910) 53,270. In 1900 it ranked second in the state, according to the population of Kenton county; and the city is served by the Chesapeake & Ohio, and the Louisville & Nashville railways, by interurban electric railways, and by steamboat lines to the Ohio river ports. It is built on a plain commanding good views and partly shut in by neighbouring hills. Its streets, mostly named from eminent Kentuckians, are paved chiefly with asphalt, macadam and brick. There are numerous fine residences and several attractive public buildings, including that of the United States government—modern Gothic in style—the court-house and city hall combined, and the public library. Covington is the seat of a Roman Catholic bishop, and its cathedral, in the flamboyant Gothic style, is one of the finest church buildings in the state. In the city are the Academy of Notre Dame and St. Joseph's high school for boys, both Roman Catholic. The principal charitable institutions are the hospital of Saint Elizabeth, a German orphan asylum, a Protestant children's home, a home for aged women and a Wayfarers' Rest. Covington is the trade centre of an extensive district engaged in agriculture and stock raising, and as such has been rated as the ninth town in the state in 1905 (value of factory products $6,009,715). Its products including tobacco, cotton goods, structural iron and steel, foundry and machine shop products, liquors and cordage. A settlement was established here in 1812, and three years later a town was laid out and named in honour of Gen. Leonard Covington (1765-1813), who was mortally wounded at Chrystler's Field during the War of 1812. In 1834 Covington was chartered as a city; and in 1908 it annexed Central Covington (pop. in 1900, 2153).

Coward, a term of contempt for one who, before danger, pain or trouble, shows fear, whether physical or moral. The derivation of the word has been obscured by a connexion in sense with the verb "caw," to instil fear into, which is derived from old Norse kvas, a word of similar meaning, and with the verb "cow," to crouch, which is also Scandinavian in origin.¹ The true derivation is from the French coe, an old form of queue, a tail, from Lat. cavia, hence courant or courard. The reference to "tail" is either to the expression "turn tail" in flight, or to the habit of animals dropping the tail between the legs when frightened; in heraldry, a lion in this position is a "lion coward." In the fable of Reynard the Fox the name of the hare is Coart, Kywert, Cuvaert or other variants.

COWBRIDGE, a market town and a municipal and contributory parliamentary borough of Glamorganshire, Wales, with a station on the Taff Vale railway branch from Llantrisant to Aberthaw on the coast, distant by rail 162½ miles from London, 12 m. W. of Cardiff, 7 m. S.E. of Bridgend, and 6 m. S. of Llantrisant station. The population in 1901 was 2020, a decrease of over 12% since 1891. Less than one-third of the number was Welsh-speaking. The town mainly consists of one long street running east and west, and in a wide valley through which runs the river Thaw (Welsh, Ddusan), here crossed by a stone bridge. 

Cowbridge is probably situated on the Roman road from Caerleon westwards, which seems to have kept nearly the course of the present main road. Roman coins have been discovered here. It has in fact been suggested, mainly on etymological grounds, that the town occupies the site of the Roman Bosium: the modern Welsh name, y Bontfaen ("stone bridge") is probably a corruption of the medieval, Pont y fôn, the precise equivalent of "Cowbridge," which is first found in documents of the second half of the 13th century as Covbruge and Cubbrig. Others place Bovium on a vicinal road, at Boverton near Llantwit Major, about 6 m. to the south near the coast, though the most likely site is near Ewenny, 5 m. to the west of Cowbridge. After the Norman conquest of Glamorgan, the town grew up as an appanage of the castle of St Quentinn, which occupies a commanding position half a mile south-west of the town. It was walled round before the 13th century. A tower is mentioned in 1487 when it was granted away by the burgesses. Leland in his itinerary (c. 1553) describes the town wall as three-quarters of a mile round and as having three gates. There was even then a considerable suburb on the west bank of the river and inside the walls. The south wall and gateway are still standing.

The town was a borough by prescription until 1682, when it received a charter of incorporation from Charles II. confirming its previous privileges. Under the Unreformed Corporations Act of 1835 the corporation was dissolved, but on the petition of the inhabitants a new charter was granted in March 1887. During the Tudor and Stuart periods Cowbridge was almost if not quite the chief town of Glamorgan, its importance being largely due to its central and accessible position in a rich agricultural district where the great number of the county gentry lived. The great sessions were held here alternately with Cardiff and Swansea from 1542 till their abolition in 1830, and the quarter sessions were held here once a year down to 1850. From 1536 to 1832 it was one of the eight contributory boroughs within the county which returned a member to parliament, but since 1832 it has been contributory with Cardiff and Llantrisant in returning a member. It has a separate commission of the peace. Sir Edward Stradling (1529-1609) established a grammar school here, but died before endowing it; it was refounded in 1685 by Sir Leoline Jenkins, who provided that it should be administered by Jesus College, Oxford, which body erected the present buildings in 1847. It has throughout its existence been one of the leading schools in Wales. An intermediate school for girls was established here by the county in 1806. The church of St Mary (formerly chapelony to Llanddewi) is of early English style and has a fine embattled tower, of the same military

¹ A connexion has also been imagined with cow (O.Eng. cu; common in Scandinavian languages, and of similar root to Skr. go, whence also Gr. bov, Lat. bov), the female bovine animal, on account of its timidity.
type as the towers of Llambilien and Eweny. There are three Nonconformist chapels. There are a town hall and market place. The town is now wholly dependent on agriculture, and has good markets and cattle fairs, that on the 4th of May being a charter fair.

COWDENBEATH, a police burgh, Fifeshire, Scotland, 53 m. N.E. of Dunfermline by the North British railway. Pop. (1891) 4240; (1901) 7908. The principal industry is coal-mining, and the public buildings include churches, schools and a hall. Meetings in connexion with the adoption and promulgation of the Covenant were held in the old parish church of Beath.

COWELL, JOHN (1554–1611), English jurist, was born at Earsborough, Devonshire. He was educated at Eton, and King’s College, Cambridge, ultimately becoming professor of civil law in that university, and master of Trinity Hall. In 1597 he compiled a law dictionary, The Interpreter, in which he exalted the king’s prerogative so much that he was prosecuted before the House of Commons by Sir Edward Coke, and saved from imprisonment only by the interposition of James I. His book was burnt by order of the House of Commons. Dr Cowell also wrote a work entitled Institutiones Juris Anglicani. He died at Oxford on the 11th of October 1611.

COWEN, FREDERIC HYMEN (1832–1906), English musical composer, was born at Kingston, Jamaica, on the 29th of January 1832. At four years old he was brought to England, where his father became treasurer to the opera at Mrs Majesty’s Theatre, and private secretary to the Earl of Dudley. His first teacher was Henry Russell, and his first published composition appeared when he was but six years old. He studied the piano with Benedict, and composition with Goss; in 1865 he was at Leipzig under Hauptmann, Moscheles, Reinecke and Plday. Returning home on the outbreak of the Austro-Prussian War, he appeared as a composer for the orchestra in an overture played at the Promenade Concerts at Covent Garden in September 1866. In the following autumn he went to Berlin, where he was under Kiel, at Stern’s conservatorium. He played many piano concertos in St James’s Hall in 1869, and from that time Cowen has been recognized as primarily a composer, his talents as a pianist being subordinate, although his public appearances were numerous for some time afterwards. His cantata, The Rose Maiden, was given in London in 1870, his second symphony by the Liverpool Philharmonic Society in 1872, and his first festival work, The Corsair, in 1876 at Birmingham. In that year his opera, Pauline, was given by the Carl Rosa Company with moderate success. In 1884 he conducted five concerts of the Philharmonic Society, and in 1888, on the resignation of Arthur Sullivan, became the regular conductor of the society, resigning the post in 1892. In the year of his appointment, 1888, he went to Melbourne as the conductor of the daily concerts given in connexion with the Exhibition there. In 1896 Cowen was appointed conductor of the Liverpool Philharmonic Society and of the Manchester orchestra, in addition to Sir Charles Hall. It was about this time that he became the conductor of the Philharmonic Society. His works include:—Operettas: Garibaldi (1860) and One Too Many (1874); operas: Pauline (1876), Thormir (1890), Signa (Milan, 1883), and Harold (1895); oratorios: The Deluge (1878), St Ursula (1881), Ruth (1887), Song of Thanksgiving (1888), The Transfiguration (1895); cantatas: The Rose Maiden (1870), The Corsair (1876), The Sleeping Beauty (1885), St John’s Eve (1886), The Water Lily (1893), Ode to the Passions (1898), besides short cantatas for female voices; a large number of songs, ranging from the popular “ballad” to more artistic lyrics, anthems, part-songs, duets, &c.; six symphonies, among which No 3, the “Scandinavian,” has had the greatest success; four overtures; suites, The Language of Flowers (1880), In the Olden Times (1883), In Fairyland (1890); four English dances (1896); a concerto for piano and orchestra, and a fantasia for the same played by M. Paderewski (1900); a quartet in C minor, and a trio in A minor, both early works in pianoforte pieces, &c. Cowen is never so happy as when treating of fantastic or fairy subjects; and whether in his cantatas for house voices, his charming Sleeping Beauty, his Water Lily or his pretty overture, The Butterfly’s Ball (1901), he succeeds wonderfully in finding graceful expression for the poetical idea. His dance music, such as is to be found in various orchestral suites, is refined, original and admirably instrumented; and if he is seldom as successful in portraying the graver aspects of emotion, the vogue of his semi-sacred songs has been widespread.

COWEN, JOSEPH (1831–1900), English politician and journalist, son of Sir Joseph Cowen, a prominent citizen and mine-owner of Newcastle-on-Tyne, was born in 1831, and was educated at Edinburgh University. In 1874 he was elected member of parliament for the borough on the death of his father, who had held the seat as a Liberal since 1865. Joseph Cowen was at that time a strong Radical on domestic questions, an advocate of co-operation, an admirer of Garibaldi, Mazzini and Kossuth, a sympathizer with Irish Nationalism, and one who in speech, dress and manner identified himself with the North-country mining class. Short in stature and uncouth in appearance, his individuality first shocked and then by its earnestness impressed the House of Commons; and his sturdy independence of party ties, combined with a gift of rough but genuine eloquence (of which his speech on the Royal Title Bill of 1876 was an example), rapidly made him one of the best-known public men in the country. He was, moreover, an Imperialist and a Colonial Federationist at a time when Liberalism was tied and bound to the Manchester traditions; and, to the constellation of the official wire-pullers, he vigorously supported Disraeli’s foreign policy, and in 1881 opposed the Gladstonian settlement with the Boers. His independence (which his detractors attributed in some degree to his alleged susceptibility to Tory compliments) brought him into collision both with the Liberal caucus and with the party organization in Newcastle itself, but Cowen’s personal popularity and his remarkable powers as an orator triumphed in his own birthplace, and he was again elected in 1885 in spite of Liberal opposition. Shortly afterwards, however, he retired to a life of leisure and was for some years occupied at the party intrigues of politics, and devoted himself to conducting his newspaper, the Newcastle Daily Chronicle, and to his private business as a mine-owner. In this capacity he exercised a wide influence on local opinion, and the revolt of the Newcastle electoriate in later years against doctrinaire Radicalism was largely due to his constant preaching of a broader outlook on national affairs. He continued behind the scenes to play a powerful part in forming North-country opinion until his death on the 18th of February 1900.

His letters were published by his daughter in 1909.

COWES, a seaport and watering-place in the Isle of Wight, England, 12 m. S.S.E. of Southampton. West Cowes is separated from East Cowes by the picturesque estuary of the river Medina, the two towns (each of which is an urban district) lying on opposite sides of its mouth at the apex of the northern coast of the island. Pop. (1901) West Cowes, 8652; East Cowes, 7551. Between them is the ferry over the Medina and is the headquarters of the Royal Yacht Squadron (founded in 1812); it is in regular steamship communication with Southampton and Portsmouth. West Cowes is served by the Isle of Wight Central railway. A steam ferry and a floating bridge across the Medina, here 600 yds. broad, unite the towns. Behind the harbour the houses rise picturesquely on gentle wooded slopes, and numerous villas adorn the vicinity. The towns owe their origin to two forts or castles, built on each side of the mouth of the Medina by Henry VIII. in 1540, for the defence of the coast; the eastern one has disappeared, but the west castle remains and is used as the club-house of the Yacht Squadron. The marine parade of West Cowes, and the public promenade called the Green, are close to the castle. The industrial population is chiefly employed in the shipbuilding yards, in the manufacture of ships’ fittings, and in engineering works. The harbour is under an elective body of commissioners. On the opposite side of the Medina a broad carriageway leads to East Cowes Castle, a handsome edifice built by John Nash, the favourite architect of George IV., in 1798, and immediately beyond it are the grounds surrounding
Osborne House (see Osborne), built in 1845 after the property had been purchased by Queen Victoria, the church of St Mildred, Whippingham, lying a mile to the south.

COWL (through Fr. coule, from Lat. cuculus or cuculla, a covering; the word is found in various forms in most European languages, cf. Ger. Kugel or Kigel, Dutch kael, Irish cochul or cochull; the ultimate origin may be the root kul, found in Lat. clam, secretly, and Gr. κανῦτευς, to hide, cover up), an outer garment worn by both sexes in the middle ages; a part of the monastic dress, hence the phrase "to take the cowl," signifying entry upon the religious life. The cuculus worn by the early Egyptian anchorites was a hood covering the head and neck. Later generations lengthened the garment until it reached to the heels, and St Benedict issued a rule restricting its length to two cubits. Chapter 55 of his Institute prescribes the following dress in temperate climates: a cowl and tunic, thick in winter and thin in summer, with a scapular for working hours and shoes and stockings, all of simple material and made in the通讯员. The hood and the frock were frequently confounded, but the council of Vienne defined the former as "a habit long and full without sleeves," and the latter as "a long habit with long and wide sleeves." While the term thus seems strictly to imply a hooded gown it is often applied to the hood alone. It is also used to describe a loose vestment worn over the frock in the winter season and during the night office.

The word "cowl" is also applied to a hood-shaped covering to a chimney or ventilating shaft, to help draw draughts, and to clear the up-current of foul air (see VENTILATION).

COWLEY, ABRAHAM (1618-1667), English poet, was born in the city of London late in 1618. His father, a wealthy citizen, who died shortly before his birth, was a stationer. His mother was wholly given to works of devotion, but it happened that there lay in her parlour a copy of The Faery Queen. This became the favourite reading of her son, and he had twice devoured it all before he was sent to school. As early as 1628, that is, in his tenth year, he composed his Tragicall History of Piramus and Thisbe, an episcopal romance written in a six-line stanza, of his own invention. It is not too much to say that this work is the most astonishing feat of imaginative precocity on record; it is marked by no great faults of immaturity, and possesses constructive merits of a very high order. Two years later the child wrote another and still more ambitious poem, Constantio and Philetus, being sent about the same time to Westminster school. Here he displayed the most extraordinary mental precocity and versatility, and wrote in his thirteenth year yet another poem, the Elegy on the Death of Dudley, Lord Carlton. These three poems of considerable size, and some smaller ones, were collected in 1633, and published in a volume entitled Poetical Blossoms, dedicated to the head master of the school, and prefaced by many laudatory verses by schoolfellows. The author at once became famous, although he had not, even yet, completed his fifteenth year. His next composition was a pastoral comedy, entitled Love's Riddle, a marvellous production for a boy of sixteen, airy, correct and harmonious in language, and rapid in movement. The style is not without resemblance to that of Randolph, whose earliest works, however, were at that time only just printed. In 1637 Cowley was elected into Trinity College, Cambridge, where he betook himself with enthusiasm to the study of all kinds of learning, and early distinguished himself as a ripe scholar. It was about this time that he composed his scriptural epic on the history of King David, one book of which still exists in the Latin original, the rest being superseded in favour of an English version in four books, called the Davidides, which he published a long time after. This has its most grave and important work is remarkable as having suggested to Milton several passages from it, afterwards made use of. THe epic, written in a very dreary and turgid manner, but in good rhymed heroic verse, deals with the adventures of King David from his boyhood to the smiting of Amalek by Saul, where it abruptly closes. In 1638 Love's Riddle and a Latin comedy, the Naufragium Joculare, were printed, and in 1641 the passage of Prince Charles through Cambridge gave occasion to the production of another dramatic work, The Guardian, which was acted before the royal visitor with much success. During the civil war this play was privately performed at Dublin, but it was not printed till 1650. It is bright and amusing, in the style common to the "sons" of Ben Jonson, the university wits who wrote more for the closet than the public stage.

The learned quiet of the young poet's life was broken up by the Civil War; he warmly espoused the royal side. He became a fellow of Trinity College, Cambridge, but was ejected by the Parliamentarians in 1643. He made his way to Oxford, where he enjoyed the friendship of Lord Falkland, and was tossed, in the tumult of affairs, into the personal confidence of the royal family itself. After the battle of Marston Moor he followed the queen to Paris, and the exile so commenced lasted twelve years. This period was spent almost entirely in the royal service, "bearing a share in the distresses of the royal family, or labouring in their affairs. To this purpose he performed several dangerous journeys into Jersey, Scotland, Flanders, Holland, or wherever else the king's troubles required his attendance. But the chief testimony of his fidelity was the laborious service he undertook in maintaining the constant correspondence between the late king and the queen his wife. In that weighty trust he betrayed himself with indefatigable integrity and unsuspected secrecy; for he deciphered and deciphered with his own hand the greatest part of all the letters that passed between their majesties, and managed a vast intelligence in many other parts, which for some years together took up all his days, and two or three nights every week. In spite of these labours he did not refrain from literary industry. During his exile he met with the works of Pindar, and determined to reproduce their lofty lyric passion in English. At the same time he occupied himself in writing a history of the Civil War, which he completed as far as the battle of Newbury, but unfortunately afterwards destroyed. In 1647 a collection of his love verses, entitled The Muses, was published, in which a year a volume of wretched satires, The Four Ages of England, was brought out under his name, with the composition of which he had nothing to do. In spite of the troubles of the times, so fatal to poetic fame, his reputation steadily increased, and when, on his return to England in 1656, he published a volume of his collected poetical works, he found himself without a rival in public esteem. This volume included the later works already mentioned, the Pindarique Odes, the Davideis, the Mistress, and some Miscellaneous. Among the latter are to be found Cowley's most vital pieces. This section of his works opens with the famous aspiration—

"What shall I do to be for ever known, 
And make the coming age my own?"

It contains elegies on Wotton, Vandyck, Falkland, William Harvey and Crashaw, the last two being among Cowley's finest poems, brilliant, sonorous and original; the amusing ballad of The Chronicle, giving a fictitious catalogue of his supposed amours; various gnomic pieces; and some charming paraphrases from Anacreon. The Pindarique Odes contain weighty lines and passages, buried in irregular and inharmonious masses of moral verbiage. Not more than one or two are good throughout, but a full posy of beauties may easily be culled from them. The long cadences of the Alexandrines with which most of the strophes close, continued to echo in English poetry from Dryden down to Gray, but the Odes themselves, which were found to be obscure by the poet's contemporaries, immediately fell into disuse. The Mistress was the most popular poetic reading of the age, and is now the least read of all Cowley's works. It was the last and most violent expression of the amatory affectation of the 17th century, an affectation which had been endurable in Donne and other early writers because it had been the vehicle of sincere emotion, but was undurable in Cowley because in him it was a mere half-baked, pretentiously aped imitation of literary calistenics. He appears to have been of a cold, or at least of a timid, disposition; in the face of these elaborately erotic volumes, we are told that to the end of his days he never summoned up courage to speak to love of a single woman in real life. The "Leonora" of The Chronicle is said to have been the
COWLEY, HANNAH—COWPER, 1ST EARL

only woman he ever loved, and she married the brother of his biographer, Sprat.

Soon after his return to England he was seized in mistake for another person, and only obtained his liberty on a bail of £1,000. In 1658 he revised and altered his play of The Guardian, and prepared it for the press under the title of The Cutter of Coleman Street, but it did not appear until 1663. Late in 1658 Oliver Cromwell died, and Cowley took advantage of the confusion of affairs to escape to Paris, where he remained until the Restoration brought him back in Charles's train. He published in 1663 Verses upon several occasions, in which The Complaint is included.

Wearied with the broils and fatigues of a political life, Cowley obtained permission to retire into the country; through his friend, Lord St Albans, he obtained a property near Chertsey, and here, devoting himself to the study of botany, and buried in his books, he lived in comparative solitude until his death. He took a great and practical interest in experimental science, and he was one of those who were most prominent in advocating the foundation of an academy for the protection of scientific enterprise. Cowley's pamphlet on The Advancement of Experimental Philosophy, 1661, led directly to the foundation of the Royal Society, to which body Cowley, in March 1667, at the suggestion of Evelyn, addressed an ode which is the latest and one of the strongest of his poems. He died in the Porch House, in Chertsey, on the 28th of July 1667. It is probable that Cowley died of consumption, while superintending his farm-labourers in the meadows late on a summer evening. On the 3rd of August Cowley was buried in Westminster Abbey beside the ashes of Chaucer and Spenser, where in 1675 the duke of Buckingham erected a monument to his memory. His Poëmata Latina, including six books "Plantarum," were printed in 1668.

Throughout their parallel lives the fame of Cowley completely eclipsed that of Milton, but posterity instantly and finally reversed the judgment of their contemporaries. The poetry of Cowley rapidly fell into a neglect as unjust as the earlier popularity had been. As a prose writer, especially as an essayist, he holds, and will not lose, a high position in literature; as a poet it is hardly possible that he can enjoy more than a very partial revival. The want of nature, the obvious and awkward art, the defective melody of his poems, destroy the interest that their ingenuity and occasional majesty would otherwise excite. He had lofty views of the mission of a poet and an inextinguishable ambition, but his chief claim to poetic life is the doury of sonorous lyric style which he passed down to Dryden and his successors of the 18th century. The collection of Cowley's poems, which he compiled in 1668, had a great success. He sent a copy to Sprat, afterwards bishop of Rochester, brought out a splendid edition in folio, to which he prefixed a graceful and elegant life of the poet. There were many reprints of this collection, which formed the standard edition till 1801, when it was superseded by A. B. Grosart's privately printed edition in two volumes, for the Chetwode Worthies library. The Essays have frequently been revised with approval. (E. G.)

COWLEY, HANNAH (1743-1809), English dramatist and poet, daughter of Philip Parkhouse, a bookseller at Tiverton, Devonshire, was born in 1743. When about twenty-five years old she married Mr Cowley, of the East India Company's service, who died in 1759. Some years after her marriage, being at the theatre with her husband, she expressed the opinion that she could write as good a piece as the one being performed, and within a fortnight she had written her first play, The Runaway. She sent it to Garrick, who produced it at Drury Lane in 1776. Between then and 1795 she wrote twelve more plays, all of which (with one exception) were produced at Drury Lane or Covent Garden; and The Belle's Stratagem (1782), with one or two others, still survives in the list of acting plays. Among other pieces were Albina, Countess Raimond, A Bold Stroke for a Husband, More Ways than One, and A School for Greybeards, or The Mourning Bride. Mrs Cowley was the author of a number of indifferent poems, mainly historical, and under the name of "Anna Matilda," which has since become proverbial, she carried on a sentimental correspondence in the World with Robert Merry. She died at Tiverton on the 11th of March 1809.

COWLEY, HENRY RICHARD CHARLES WELLESLEY, 1ST EAL (1804—1884), British diplomatist, was the eldest son of Henry Wellesley, 1st Baron Cowley (1773—1847), and Charlotte, daughter of Charles, 1st Earl Cadogan, and was consequently a nephew of the duke of Wellington and of the marquess Wellesley. Born on the 17th of June 1804, he entered the diplomatic service in 1824, receiving his first important appointment in 1848, when he became minister plenipotentiary to the Swiss cantons; and in the same year he was sent to Frankfort to watch the proceedings of the German parliament. This was followed by his appointment as envoy extraordinary to the new Germanic confederation, a position which he only held for a short time, as he was chosen in 1852 to succeed the 1st marquess of Normandy as the British ambassador in Paris. Baron Cowley, as Wellesley had been since his father's death in 1847, held this important post for fifteen years, and the story of his diplomatic life in Paris cannot be separated from the general history of England and France. As minister during the greater part of the reign of Napoleon III., he conducted the delicate negotiations between the two countries during the time of those eastern complications which preceded and followed the Crimean War, and also during the excitement and unrest produced by the attempt made in 1858 by Felice Orsini to assassinate the emperor of the French; his diplomatic skill was no less in evidence during the war between France and Austria, which was fought in Italy. In 1857 he had been created Earl Cowley and Viscount Dangan; in 1866 he was made a knight of the Garter; and having assisted Richard Cobden to conclude the commercial treaty between Great Britain and France in 1860, he retired in 1867 from a position which he had filled with distinction to himself and with benefit to his country.

COWLEY, FATHERS, the name commonly given to the members of the Society of Mission Priests of St John the Evangelist, an Anglican religious community, the headquarters of which are in England, at Cowley St John, close to Oxford. The society was founded in 1865 by the Rev. R. M. Benson "for the cultivation of a life dedicated to God according to the principles of poverty, chastity and obedience." The society, which is occupied both with educational and missionary work, has a house in London and branch houses at Bombay and Poona in India, at Cape Town and at St Cuthbert's, Kasraria, in South Africa; and at Boston in the United States of America. The costume of the Cowley Fathers consists of a black frock or cassock confined by a black cord and a long black cloak.

COWPENS, a town of Spartanburg county, South Carolina, U.S.A., in the N. part of the state. Pop. (1900) 692; (1910) 1101. It is served by the Southern railway. In colonial days cattle were rounded up and branded here—whence the name. Seven miles N. of the town is the field of the battle of Cowpens, fought on the 17th of January 1781, during the War of American Independence, between the Americans under Gen. Daniel Morgan and the British under Gen. Banastre Tarleton, the former being defeated. A monument was erected on the battlefield in 1850, but was much defaced during the Civil War. The town of Cowpens was founded in 1876, and was incorporated in 1880.

COWPER, WILLIAM COWPER, 1ST EAL. (c. 1665—1723), lord chancellor of England, was the son of Sir William Cowper, Bart., of Ratling Court, Kent, a Whig member of parliament of some mark in the two last Stuart reigns. Educated at St Albans school, Cowper was called to the bar in 1688; having promptly given his allegiance to the prince of Orange on his landing in England, Cowper was made recorder of Colchester in 1694, and in 1695 entered parliament as member for Hertford. He
Cowper, WILLIAM

enjoyed a large practice at the bar, and had the reputation of being one of the most effective parliamentary orators of his generation. He lost his seat in parliament in 1702 owing to the unpopularity caused by the trial of his brother Spencer on a charge of murder. In 1705 he was appointed lord keeper of the great seal, and took his seat on the woolsack without a peerage. In the following year he conducted the negotiations between the English and Scottish commissioners for arranging the union with Scotland. In November of the same year (1726) he succeeded to his father’s baronetc; and on the 14th of December he was raised to the peerage as Baron Cowper of Wingham, Kent.

When the union with Scotland came into operation in May 1707 the queen in council named Cowper lord high chancellor of Great Britain, he being the first to hold this office. He presided at the trial of Dr Sacheverell in 1710, but resigned the seat when Harley and Bolingbroke took office in the same year. On the death of Queen Anne, George I. appointed Cowper one of the lords justices for governing the country during the king’s absence, and a few weeks later he again became lord chancellor. A paper which he drew up for the guidance of the new king on constitutional matters, entitled *An Impartial History of Party*. He marks the advance of English opinion towards party government in the modern sense. It was published by Lord Campbell in his *Lives of the Lord Chancellors*. Cowper supported the impeachment of Lord Oxford for high treason in 1715, and in 1716 presided as lord high steward at the trials of the peers charged with complicity in the Jacobite rising, his sentences on whom have been censured as unnecessarily severe. He warmly supported the septennial bill in the same year. On the 18th of March 1718 he was created Viscount Fordwich and Earl Cowper, and a month later he resigned office on the plea of ill-health, but probably in reality because George I. accused him of espousing the prince of Wales’s side in his quarrel with the king. Taking the lead against his former colleagues, Cowper opposed the proposal brought forward in 1719 to limit the number of peers, and also the bill of pains and penalties against Atterbury in 1723. In his last years he was accused, but probably without reason, of active sympathy with the Jacobites. He died at his residence, Colne Green, built by himself on the site of the present mansion of Penshanger on the 10th of October 1723.

Cowper was not a great lawyer, but Burnet says that “he must have been a court of chancery with impartial justice and great dispatch”; the most eminent of his contemporaries agreed in extolling his oratory and his virtues. He was twice married—first, about 1686, to Judith, daughter and heiress of Sir Robert Booth, a London merchant; and secondly, in 1706, to Mary, daughter of John Clavering, of Chappelwell, Durham. Swift (Examiner, xvii., xxii.) alludes to an allegation that Cowper had been guilty of bigamy, a slander for which there appears to have been no solid foundation. His younger brother, Spencer Cowper (1669–1728), was tried for the murder of Sarah Stout in 1699, but was acquitted; the lady, who had fallen in love with Cowper, having in fact committed suicide on account of his inattention. He was one of the managers of the impeachment of Sacheverell; was attorney-general to the prince of Wales (1714), chief justice of Chester (1717), and judge of the common pleas (1727). He was grandfather of William, 3rd Earl Cowper, poet.

The 1st earl left two sons and two daughters by his second wife. The eldest son was William (1706–1764), who succeeded to the title, the assumed name of Clavering in addition to that of Cowper on the death of his maternal uncle. His wife was a daughter of the earl of Grantham, and grand-daughter of the earl of Ossory. The son of this marriage, George Nassau, 3rd Earl Cowper (1738–1789), inherited the estates of the earl of Grantham; and in 1778 he was created by the emperor Joseph II. a prince of the Holy Roman Empire. The 5th earl (1778–1837) married a daughter of Lord Melborne, the prime minister, by whom he had two sons; and his widow married as her second husband Lord Palmerston, who devised his property of Broadlands to her second son, William Francis Cowper-Temple (1811–1888), who was created Baron Mount Temple in 1850. The elder son, George Augustus Frederick (1806–1856), 6th Earl

Cowper, married Anne Florence, daughter of Thomas Philip, earl de Grey; and this lady at her father’s death became suo jure baroness Lucas of Cradwell. Francis Thomas de Grey, 7th Earl Cowper (1834–1905), in addition to the other family titles, became in 1871 10th Baron Dingwall in the peerage of Scotland, and 8th Baron Butte of Moore Park in the peerage of Ireland as heir-general of Thomas, earl of Ossory, son of the 1st duke of Ormonde; the attainer of 1715 affecting those titles having been reversed in July 1871. On the death of his mother he also inherited the barony of Lucas of Cradwell. On the death without issue in 1905 of the 7th earl, who was lord lieutenant of Ireland 1880–1882, the earldom and barony of Cowper, together with the viscountcy of Fordwich, became extinct; the barony of Butler fell into abeyance among his sisters and their heirs, and the baronies of Lucas and Dingwall devolved on his nephew, Auberon Thomas Herbert (b. 1876).

**COWPER, WILLIAM** (1731–1800), English poet, was born in the rectory (now rebuilt) of Great Berkhamstead, Hertfordshire, on the 26th of November (O.S. 15th) 1731, his father the Rev. John Cowper being rector of the parish as well as a chaplain to George II. On both the father’s and the mother’s side he was of ancient lineage. The father could trace his family back to the time of Edward IV., when the Cowpers were Sussex landowners, while his mother, Ann, daughter of Roger Donne of Ludham Hall, Norfolk, was of the same race as the poet Donne, and the family claimed to have Plantagenet blood in its veins. Of more human interest were Cowper’s immediate predecessors. His grandfather was that Spencer Cowper who, after being tried for his life on a charge of murder, lived to be a judge of the court of common pleas, while his elder brother became lord chancellor and Earl Cowper, a title which became extinct in 1905. Here is the poet’s genealogical tree.

John Cooper,¹ Alderman of London (d. 1699).

Sir William Cowper, Bart. (d. 1642).

John Cowper (died in prison 1643).

Sir William Cowper, 2nd Bart. (d. 1706).

The Rev. John Cowper was twice married. Cowper’s mother, to whom the memorable lines were written beginning “Oh that these lips had language,” was his first wife. She died in 1737 at the age of thirty-four, when the poet was but six years old, and she is buried in Berkhamstead church. Cowper’s stepmother is buried in Bath, and a tablet on the walls of the cathedral commemorates her memory. The father, who appears to have been a conscientious clergyman with no special interest in his sons, died in 1756 and was buried in the Cowper tomb at Penshanger. Only one other of his seven children grew to manhood—John, who was born in 1737.

The poet appears to have attended a dame’s school in earliest infancy, but on his mother’s death, when he was six years old, he was sent to boarding-school, to a Dr Pitman at Markyate, a

¹ Alderman Cooper thus spelt his name and all the family from that day to this, including the poet, have so pronounced it.
COWPER, WILLIAM

It was not until 1776 that the poet’s mind cleared again. In 1779 he made his first appearance as an author by the Oney Hymns, written in conjunction with Newton, Cowper’s verses being indicated by a “C.” Mrs Unwin suggested secular verse, and Cowper wrote much, and in 1782 when he was fifty-one years old there appeared Poems of William Cowper of the Inner Temple, Esq.: London, Printed for J. Johnson, No. 72 St Paul’s Churchyard. The volume contained “Table Talk,” “The Progress of Error,” “Truth,” “Expostulation” and much else that survives to be read in our day by virtue of the poet’s finer work. This finer work was the outcome of his friendship with Lady Austen, a widow who, on a visit to her sister, the wife of the vicar of the neighbouring village of Clifton, made the acquaintance of Cowper and Mrs Unwin. The three became great friends. Lady Austen determined to give up her house in London and to settle in Olney. She suggested The Task and inspired John Gilpin and The Royal George. But in 1784 the friendship was at an end, doubtless through Mrs Unwin’s jealousy of Lady Austen. Cowper’s second volume appeared in 1785:—The Task: A Poem in Six Books. By William Cowper of the Inner Temple, Esq.; To which are added by the same author An Epistle to Joseph Hill, Esq., Tirocinium or a Review of Schools, and the History of John Gilpin; London, Printed for J. Johnson, No. 72 St Paul’s Church Yard; 1785. His first book had been a failure, one critic even declaring that “Mr Cowper was certainly a good, pious man, but without one spark of poetic fire.” This second book was an instantaneous success, and indeed marks an epoch in literary history. But before its publication—in 1784—the poet had commenced the translation of Homer. In 1786 his life at Olney was cheered by Lady Hesketh taking up a temporary residence there. The cousins met after an interval of twenty-three years, and Lady Hesketh was to be Cowper’s good angel to the end, even though her letters disclose a considerable impatience with Mrs Unwin. At the end of 1786 a removal was made to Weston Underwood, the neighbouring village which Cowper had frequently visited as the guest of his Roman Catholic friends the Throckmorts. This was to be his home for yet another ten years. Here he completed his translation of Homer, materially assisted by Mr Throckmorton’s chaplain Dr Gregson. There are six more months of insanity to record in 1787. In 1790, a year before the Homer was published, commenced his friendship with his cousin John Johnson, known to all biographers of the poet as “Johnny of Norfolk.” Johnson also aspired to be a poet, and visited his cousin armed with a manuscript. Cowper discouraged the poetry, but loved the writer, and the two became great friends. New friends were wanted, for in 1792 Mrs Unwin had had a paralytic stroke, and henceforth she was a hopeless invalid. A new and valued friend of this period was Hayley, famous in his own day as a poet and in history for his association with Romney and Cowper. He was drawn to Cowper by the fact that both were contemplating an edition of “Milton,” Cowper having received a commission to edit, writing notes and translating the Latin and Italian poems. The work was never completed, and Cowper was in hospital in London, the work was over. In the following year a removal took place into Norfolk under the loving care of John Johnson. Johnson took Cowper and Mary Unwin to North Tuddenham, thence to Mundenley, then to Dunham Lodge, near Swaffham, and finally in October 1796 they moved to East Dereham. In December of that year Mrs Unwin died. Cowper lingered on, dying on the 29th of April 1800. The poet is buried near Mrs Unwin in East Dereham church.

Cowper is among the poets who are epoch-makers. He brought a new spirit into English verse, and redeemed it from the artificiality and the rhetoric of many of his predecessors. With him began the “enthusiasm of humanity” that was afterwards to become so marked in the poetry of Burns and Shelley, Wordsworth and Byron. With him began the deep sympathy with nature, and love of animal life, which was to characterize so much of later poetry.

Although Cowper cannot rank among the world’s greatest poets or even among the most distinguished of poets of his own country, his place is a very high one. He had what is a rare
quality among English poets, the gift of humour, which was very singularly absent from others who possessed many other of the higher qualities of the intellect. Certain of his poems, moreover,—for example, “To Mary,” “The Receipt of my Mother’s Portrait,” and the ballad “On the Loss of the Royal George,”—will, it may safely be affirmed, continue to be familiar to successive generations in a way that pertains to few things in literature. Added to this, one may note Cowper’s distinction as a letter-writer. He ranks among the half-dozen greatest letter-writers in the English language, and he was perhaps the only great letter-writer with whom the felicity was due to the power of what he has seen rather than what he has read.

BIBLIOGRAPHY.—The first important life of Cowper was by Hayley in 1803. In its complete form it appeared in 4 volumes in 1806 and was reprinted in 1809 and 1815. In 1835, 3 volumes were reprinted again by the Rev. T. S. Southey with the Correspondence in 8 volumes in 1835; Robert Southey’s much more valuable Life and Letters appeared also in 15 volumes in 1834–1837. The Private Correspondence, edited by John Johnson, appeared in 2 volumes in 1824 and again in 1835. The Complete Correspondence, edited by Thomas Wright, was published in 1904, but more correspondence appeared in Notes and Queries, July, August and September 1904, and in The Poems of William Cowper, edited by J. C. Bailey (1905). Edward Dowden used the Correspondence which he compiled as the basis of his Life of Cowper. The Complete Works. Essays by Leslie Stephen, Stopford Brooke, Whitwell Elwin, George Eliot and Walter Bagehot deserve attention. See also St. Beuve’s Causeries du Lundi (1868), vol. xi.; Letters of Lady Hesketh to John Johnstone (1868); J. F. Jameson, John Neave and Mary Unwin, by Caroline Geary (1900); and A Collection of the Poetic Works of William Cowper, by John Neave (1887).

COWRY.—COX, DAVID

COWRY, the popular name of the shells of the Cypraea, a family of mollusks. Upwards of 100 species are recognized, and they are widely distributed over the world—their habitat being the shallow water along the sea-shore. The best known is the money cowry or Cypraea moneta, a small shell about half an inch in length, white and straw-coloured without and blue within, which derives its distinctive name from the fact that in various countries it has been employed as a kind of currency. (See SHELL-MONEY.) In Africa among those tribes, such as the Niam-Niam, who do not recognize their monetary value, the shells are in demand as fashionable decorations, just as in Germany they were in use as an ornament for horses’ harness, and were worn or eaten to acquire several names of Cowry’s Works. Essays by Leslie Stephen, Stopford Brooke, Whitwell Elwin, George Eliot and Walter Bagehot deserve attention. See also St. Beuve’s Causeries du Lundi (1868), vol. xi.; Letters of Lady Hesketh to John Johnstone (1868); J. F. Jameson, John Neave and Mary Unwin, by Caroline Geary (1900); and A Collection of the Poetic Works of William Cowper, by John Neave (1887).

Cowry, David (1738–1859). English painter, was born on the 29th of April 1783, in a small house attached to the forge of his father, a hardworking master smith, in a mean suburb of Birmingham. Turning his hand to what he could get to do, Joseph Cox, the father, was both blacksmith and whitesmith, and when the war with France began took to the making of bayonets and horse

Shoes, on wholesale commission, and immediately the boy David was thought able to assist he was taken from the poor elementary school in the neighbourhood, and set to the anvils. The attempt to turn the boy to this kind of labour had, however, been made too early; it was too heavy for his strength, and he was sent to what was called by the cyclops of Birmingham a “toy trade,” making lacquered buckles, painted lockets, tin snuff-boxes and other “fancy” articles. Here David very soon acquired some power of painting miniatures, and his talents might have been misdirected had his master, Fielder by name, not released him from his apprenticeship by dying by his own hand; and David found an opening as colour-grinder and scene-painter’s fag in the theatre then leased, with several others, by the father of Macready, the tragedian.

This obscure step, not one of promotion at the time, was really the most important incident in the uneventful career of Cox. The boy, who had inherited a rather weakly body, and had been trained with care by a pious mother, while intellectually negative and unable to cope with any kind of learning whatever, had endless perseverance, great strength of application, and all through life remained genial, gentle, simple-minded and modest, his penetration and self-reliance being wholly professional, and his love of learning a subject. Not very quick, and with little versatility, he went step by step in one line of study from the time he began to get the smallest remuneration for his pictures to the age of seventy-five, when he painted large in oil very much the same class of subjects he had of old produced small in water-colours, with the same impressive and unaffectedly noble sentiment, only increased by the mastery of almost infinite practice. He was never led astray by fictitious splendour of any kind, except once indeed in 1825, when he imitated Turner, and produced a classic subject he called “Carthage, Aeneas, and Achates.” He never visited Venice or Egypt, or crossed the Channel except for a week or two in Belgium and Paris, and never even went to Scotland for painting purposes. Bettws-y-Coed and its neighbourhood was everything to him, and characteristics most truly English were beloved by him with a sort of filial instinct. So completely did he love the country, that even London, where it was his interest to live, had few attractions, and did not retain him long.

This residence in the metropolis which began in 1804 was, however, of the most essential educational advantage to him. The Water-Colour Society was established the year after he arrived, and was mainly supported by landscape-painters. He was not, of course, admitted at first into membership, not till 1813, before which time an attempt to establish a rival exhibition had been made. In Cox joined, the result being very serious to him, an entire failure entailing the seizure and forced sale of all the pictures. At that time the tightest economy was the rule with him, and to save the trifling cost of new strains or stretching boards, he covered up one picture by another. When these works were prepared for re-sale, fifty years afterwards, some of them yielded picture after picture, peeled off the boards like the waistcoats from the body of the gravedigger in Hamlet!

While lodging near Astley’s Circus he married his landlady’s daughter, and then took a modest cottage at Dulwich, where he gradually left off scene-painting and became teacher, giving lessons at ten shillings a lesson. This entailed walking to the pupils’ homes, and the gift of the paintings done before the pupils. These have since been frequently sold for large sums, but his own price, when lucky enough to sell his best works, was never over a shilling, and sometimes as low as a shilling. He was a friend of a number of artists of no small reputation. Sometimes, indeed, he sold them in quantities at two pounds a dozen to be resold to country teachers. By and by he resisted the leaving of the work done to the pupil, but with little advantage to himself, as he saw no end to the accumulation of his own productions, and actually tore them up, and threw them into areas, or pushed them into drains during his trudge homeward. A number of years after he pointed out a particular drain to a friend, and said, “Many a work of mine has gone down that way to the Thames!”

Shortly after he had turned thirty, his stay in London suddenly
ended. He was offered the enormous sum of £100 per annum, by a ladies' college in Hereford, and thither he went. This sum he supplemented by teaching in the Hereford grammar school for many years, at six guineas a year, and in other schools at better pay, but still, and up to his fortieth year, we find his prices for pictures from eight to twenty-five shillings. Cox has no history apart from his productions, and these particulars as to his remuneration possess an interest almost dramatic when we contrast them with the enormous sums realized by his later works, and with the "honours and observance, troops of friends," that accompanied old age with him, when settled down in his own home at Harborne, near his native town, where he died on the 7th of June 1850.

Cox's second short residence in London, dating from 1835 to 1840, marks the period of his highest powers. During those years, and for twelve years after, his productiveness kept pace with his mastery, and it would be difficult to overrate the impressiveness of effect, and high feeling, within the narrow range of subject displayed by many of these works. He was now surrounded by dealers, and wealth flowed in upon him. Still he remembered the same, a man with few wants and scarcely any enjoyments except those furnished by his brush and his colours. The home at Harborne was a pleasant one, but the approach to the front was useless as the door was kept fastened up, the only entrance being through the garden at the back, and the principal room appropriated as his studio he was content to reach by a narrow stair from the kitchen. Neither in it nor elsewhere was there any luxury or even taste visible:—no bric-à-brac, no objects of interest, few or no books, no pictures except landscapes by his friends. When in winter, after his wife's death, the fire went out, and the cold at last surprised him, he lifted his easel into the little dining-room and began again. A union of his friends was formed in 1855 to procure a portrait of him, which was painted by Sir J. Watson Gordon; and an exhibition of his works was opened in London in 1858 and again another in 1859. This was actually open when the news of his death arrived.

The number of David Cox's works, great and small, is enormous. He produced hundreds annually for perhaps forty-five years. Before his death and for ten years thereafter, their prices were remarkable, as witness the following obtained at auction—"Going to the Mill," £1575; "Old Mill at Bettwey-Coed," £1575; "Outskirts of a Wood, with Gipsies," £2395; "Peace and War," £3430.

See Hall, Biography of David Cox (1881). (W. B. Sc.)

COX, Sir George William (1827-1902), English divine and scholar, was born on the 10th of January 1827, at Benares, India, and was educated at Rugby and Trinity College, Oxford. In 1850 he was ordained, and in 1850 took a mastership at Cheltenham College, which he held for only a year. He had already contributed to the Edinburgh Review, and had published in 1850 Poems, Legendary and Historical (with E. A. Freeman), and in 1853 a Life of St Boniface. From 1861 he devoted himself entirely to literary work, chiefly in connexion with history and comparative mythology. Many of his works were avowedly popular in character, and the most important, the History of Greece, has been superseded and is now of little value. His studies in mythology were inspired by Max Muller, but his treatment of the subjects was his own. He was an extreme supporter of the solar and nebular theory as the explanation of myths. He also edited (with W. T. Treadwell) A Dictionary of Greek and Roman Literature and Art (1852). Sir George Colenso succeeded to the baronetcy in 1877 was a Broad Churchman, and a prominent supporter of Bishop Colenso in 1863-1866; and five years after Colenso's death he published (1888) his Life of the bishop. He was himself nominated to the see of Natal, but was refused consecration. In 1881 he was made vicar of Scrayingham, York, but resigned the living in 1897. In 1896 he was given a civil list pension. He died at Walmer on the 9th of February 1902.

Works. — Tales from Greek Mythology (1861); A Manual of Mythology (1867); Latin and Teutonic Christendom (1870); The Mythology of the Aryan Nations (1870, new ed., 1882); History of Greece (1874); General History of Greece (1876); History of the Establishment of British Rule in India, and An Introduction to the Science of Comparative Mythology (1881); Lives of Greek Statesmen (1885); Concise History of England (1897).

COX, Jacob Dolson (1828-1900), American general, political leader and educationalist, was born on the 27th of October 1828 in Montreal, Canada. His father, a shipbuilder of German descent (Koch), and his mother, a descendant of William Brewster, were natives of New York City, where the boy grew up, studying law in an office in 1842-1844, and working in a broker's office in 1844-1846, and where, under the influence of Charles G. Finney (1792-1875), whose daughter he afterwards married, he prepared himself for the ministry. He graduated at Oberlin College in 1851, having in the meantime given up his theological studies in rebellion at Finney's dogmatism. In 1851-1853 he was superintendent of schools at Warren, Ohio; in 1853 was admitted to the Ohio bar, being at that time an anti-slavery Whig; and in 1859 was elected to the state senate, in which with Garfield and James Monroe (1810-1883) he formed the "Radical Triumvirate," Cox himself presenting a petition to a personal liberty law and urging woman's rights, especially larger property rights to married women. Appointed by Governor Dennison one of three brigadiers-general of militia in 1860, he eagerly undertook the study of tactics, strategy and military history. He rendered great assistance in raising troops for the Union service in 1861, enlisted himself in spite of poor health and a family of six small children, and in April was commissioned a brigadier-general, U.S.V. He took part in the West Virginia campaign of 1861, served in the Kanawha region, in supreme command after Rosecrans's relief in the spring, until August 1862, when his troops were ordered to join Burnside's 9th Corps in Virginia. After the death at his side of General Reno in the battle of South Mountain, and during Antietam, Cox commanded the corps, and at the close of the campaign (6th Oct. 1862) he was appointed major-general, U.S.V., but the appointment was not confirmed. In April-December 1863 he was head of the department of Ohio. In 1864 he took part in the Atlanta campaign under Sherman, as a divisional and subsequently corps-commander; at the battle of Franklin he commanded the 23rd Corps, and he served at Nashville also. He led an expedition following Sherman into the Carolinas and fought two successful actions with Bragg at Kinston, N.C. He was governor of Ohio in 1866-1867, and as such advocated the colonization of the freedmen in a restricted area, and sympathized with President Johnson's programme of Reconstruction and worked for a compromise between Johnson and his opponents, although he finally deserted Johnson. In 1868 he was chairman of the Republican national convention which nominated Grant. He was secretary of the interior in 1869-1870; opposed the confirmation of the treaty for the annexation of Santo Domingo, negotiated by O. E. Babcock and urged by President Grant; introduced the merit system in his department, and resigned in October 1870 because of pressure put on him by politicians piqued at his prohibition of campaign levies on his clerks, and because of the interference of Grant in favour of William McGarrah's attempt by legal proceedings to obtain from Cox a patent to certain California mining laws. But took up legal practice in Cincinnati, became president in 1873, and until 1877 was receiver, of the Toledo & Wabash & Western. In 1877-1879 he was a representative in Congress. From 1881 to 1897 he was dean of the Cincinnati law school, and from 1885 to 1889 president of the University of Cincinnati. He died at Magnolia, Massachusetts, on the 4th of August 1900. A successful lawyer, and in his later years a prominent microscopist, who won a gold medal of honour for microphotography at the Antwerp Exposition of 1891, he is best known as one of the greatest "civilian" generals of the Civil War, and, with the possible exception of J. C. Ropes, the highest American authority of his time on military history, particularly the history of the American Civil War. He wrote Atlanta (New York, 1882) and The March to the Sea, Franklin and Nashville (New York, 1882), both in the series Campaigns of the Civil War: The Second Battle of Bull Run, as Connected
with the Fife John Porter Case (Cincinnati, 1882); and the valuable Military Reminiscences of the Civil War (2 vols., New York, 1900) published posthumously.

COX, KENYON—COX, S. H.

COX, RICHARD (1500?–1551), dean of Westminster and bishop of Ely, was born of obscure parentage at Whaddon, Buckinghamshire, in 1490 or 1500. He was educated at the Benedictine priory of St Leonard Snellsail near Whaddon, at Eton, and at King's College, Cambridge, where he graduated B.A. in 1524. At Walsingham's invitation he became a member of the cardinal's new foundation at Oxford, was incorporated B.A. in 1525, and created M.A. in 1526. In 1530 he was engaged in preparing the liturgical books for the members of the university to approve of the king's divorce. A premature expression of Luther's views is said to have caused his departure from Oxford and even his imprisonment, but the records are silent on these sufferings which do not harmonize with his appointment as master of the royal foundation at Eton. In 1533 he appears as author of an ode on the coronation of Anne Boleyn, in 1535 he graduated B.A. at Cambridge, proceeding D.D. in 1537, and in the same year subscribing the Institution of a Christian Man. In 1540 he was one of the fifteen divines to whom were referred crucial questions on the sacraments and the seat of authority in the Church; his answers (printed in Pococke's Burning, iii. 443–446) indicate a mind tending away from Catholicism, but susceptible to "the king's doctrine"; and, indeed, Cox was one of the divines by whom Henry said the "King's Book" had been drawn up when he wished to impress upon the Regent Arran that it was not exclusively his own doing. Moreover, he was present at the examination of Barnes, subscribed the divorce of Anne of Cleves, and in that year of reaction became archdeacon and prebendary of Ely and canon of Westminster. He was employed on other royal business in 1541, was nominated to the projected bishopric of Southwell, and was made king's chaplain in 1542. In 1543 he was employed to ferret out the "Prebendaries' Plot" against Cranmer, and became the archbishop's chancellor. In December he was appointed dean of Osney (afterwards Christ Church) Oxford, and in July was made almoner to Prince Edward, in whose education he took an active part. He was present at Dr Crome's recantation in 1546, denounced it as insincere and insufficient, and severely handled him before the privy council.

After Edward's accession, Cox's opinions took a more Protestant turn, and he became one of the most active agents of the Reformation. He was consulted on the compilation of the Communion office in 1548, and the first and second books of Common Prayer, and sat on the commission for the reform of the canon law. As chancellor of the university of Oxford (1547–1552) he promoted foreign divines such as Peter Martyr, and was a moving spirit of the two commissions which sought with some success to eradicate everything savouring of popery from the books, MSS., ornaments and endowments of the university, and earned Cox the sobriquet of its canceller rather than its chancellor. He received other rewards, a canonry of Windsor (1548), the rectory of Harrow (1547) and the deanery of Westminster (1549). He lost these prefermenton Mary's accession, and was for a fortnight in August 1553 confined to the Marshalsea. He was not of the stuff of which martyrs are made; he remained in obscurity until after the failure of Wyatt's rebellion, and then in May 1554 escaped in the same ship as the future archbishop Sandys, to Antwerp. Thence in March 1555 he made his way to Frankfort, where he played an important part in the first struggle between Anglicanism and Puritanism. The exiles had, under the influence of Knox and Whittingham, adopted Calvinistic doctrine and a form of service far more Puritanical than the Prayer-Book of 1552. Cox stood up for that service, and the exiles were divided into Knoxians and Coxians. Knox attacked Cox as a pluralist, Cox accused Knox of treason to the emperor Charles V. This proved more dangerous charge: Knox and his followers were expelled, and the Prayer-Book of 1555 was restored.

In 1559 Cox returned to England, and was elected bishop of Norwich, but the queen changed her mind and Cox's destination to Ely, where he remained twenty-one years. He was an honest, but narrow-minded ecclesiastic, who held what views he did hold intolerantly, and was always wanting more power to constrain those who differed from him (see his letter in Hatfield MSS. i. 308). While he refused to minister in the queen's chapel because of the crucifix and lights there, and was a bitter enemy to the Roman Catholics, he had little more patience with the Puritans. He was grasping, or at least tenacious of his rights in money matters, and was often brought into conflict with courtiers who coveted episcopal lands. The queen herself intervened, when he refused to grant Ely House to her favourite, Sir Christopher Hatton; but the well-known letter beginning "Proud Prelate" and threatening to unfrock him seems to be an impudent forgery which was printed in 1680, at Ely, in 1706. At last, in 1668, it was the church that forced a way. These and other trials led him to resign his see in 1680, and it is significant that it remained vacant for nineteen years. Cox died on the 22nd of July 1581: a monument erected to his memory twenty years later in Ely cathedral was defaced, owing, it was said, to his evil repute. Strype (Whitgift, i. 2) gives Cox's hot temper and marriage as reasons why he was not made archbishop in 1583 in preference to Whitgift, who had been his chaplain; but Cox had been dead two years in 1583. His first wife's name is unknown; she was the mother of his five children, of whom Joanna married the eldest son of Archbishop Parker. His second wife was the widow of William Turner (d. 1668), the botanist and dean of Wells.

Voluminous details about Cox's life are given in Strype's Works, Parker Soc. Publ., and Cooper's Athenae Cantab. i. 437–445. See also Letters and Papers of Henry VIII.; Acts of the Privy Council; Cal. Dom. State Papers; Cal. Hatfield MSS.; Lit. Rem. of Edward VI.; Whittingham's Troubles at Frankfort; Machyn's Diary; Pococke's Burning; Bennham's Ely; Willis's Cathedrals; Le Neve's Pass.; R. W. Dixon's Church History. (A. F. P.)

COX, SAMUEL (1826–1893), English nonconformist divine, was born in London on the 19th of April 1826. For some years he worked as an apprentice in the London docks, and then entered the Baptist College at Stepney. In 1851 he became pastor of a Baptist church at Southsea, removing in 1855 to Ryde, and in 1863 to Nottingham. He was president of the Baptist Association in 1873 and received the degree of D.D. from St Andrews in 1882. Cox had distinct gifts as a biblical expositor and was the founder and first editor of a monthly journal The Expositor (1875–1884). Among the best known of his numerous theological publications are Salvator Mundi (1877), A Commentary on the Book of Job (1886), The Larger Hope (1883).

COX, SAMUEL HARRISON (1793–1880), American Presbyterian divine, was born in Rahway, N. J., on 28th July 1793, of Quaker stock. He was pastor of the Presbyterian church at Mendham, N. J., in 1817–1821, and of two churches in New York from 1821 to 1834. He helped to found the University of the City of New York, and from 1834 to 1837 was professor of pastoral
COXIE—COXWELL

COXIE, WILLIAM (1747–1828), English historian, son of Dr William Coxie, physician to the royal household, was born in London on the 7th of March 1747. Educated at Marylebone grammar school and at Eton College, he proceeded to King's College, Cambridge, and was elected a fellow of this society in 1768. In 1771 he took holy orders, and afterwards visited many parts of Europe as tutor and travelling companion to various noblemen and gentlemen. In 1786 he was appointed vicar of Kingston-on-Thames, and in 1788 rector of Bemerton, Wiltshire. He also held the rectory of Stourton from 1801 to 1811 and that of Fovant from 1811 until his death. In 1791 he was made prebendary of Salisbury, and in 1804 archdeacon of Wiltshire. He married in 1803 Eleanora, daughter of William Sharp, consuls-general for Russia, and widow of Thomas Yelldam of St Peters burg. He died on the 8th of June 1828.

During a long residence at Bemerton Coxie was mainly occupied in literary work. His Memoirs of Sir Robert Walpole (London, 1798), Memoirs of Horatio, Lord Walpole (London, 1802), Memoirs of John, duke of Marlborough (London, 1818–1819), Private and Original Correspondence of Charles Talbot, duke of Shrewsbury (London, 1821), Memoirs of the Administration of Henry Pelham (London, 1829), are very valuable for the history of the 18th century. His History of the House of Austria (London, 1807, new ed. 1853 and 1873), and Memoirs of the Bourbon Kings of Spain (London, 1813), give evidence of careful and painstaking work on the part of the author. The style, however, as in all his works, is remarkably dull. His other works are mainly accounts of his travels: Sketches of the Natural, Political and Civil State of Switzerland (London, 1779), Account of the Russian Discoveries between Asia and America (London, 1780), Account of Prisons and Hospitals in Russia, Sweden and Denmark (London, 1781), Travels into Poland, Russia, Sweden and Denmark (London, 1784), Travels in Switzerland (London, 1789), Letter on Secret Tribunals of Westphalia (London, 1796), Historical Tour in Mompouthshire (London, 1801). He also edited Guy's Fables, and wrote a Life of John Gay (Salisbury, 1797), Anecdotes of G. F. Handel and J. C. Smith (London, 1798), and a few other works of minor importance.

Some of his books have been translated into French, and several have gone through two or more editions.

COXSIN (properly “cocksomn”, and pronounced cox’n, usually shortened to “cox”; from “cock”, a small boat, and swain, a servant), in the navy, a petty officer in charge of a ship’s boat and its crew, who steers; the coxswain of the captain’s gig takes a special rank among petty officers. In the National Lifeboat Institution of Great Britain the “coxswain” is a paid permanent official on each station, who has charge of the lifeboat and house, is responsible for its care, and steers and takes command when absent. The word is also used, generally, of any one who steers a boat.

COXWELL, HENRY TRACEY (1810–1900), English aeronaut, was born at Woolwich, Kent, on the 2nd of March 1810, the son of a naval officer. He was educated for the army, but became a dentist. From a boy he had been greatly interested in ballooning, them in its infancy, but his own first ascent was not until 1834. In 1848 he became a professional aeronaut, making numerous public ascents in the chief continental cities. Returning to London, he gave exhibitions from the Cremorne and subsequently from the Surrey Gardens. By 1861 he had made over 400 ascents. In 1862 in company with Dr James Glashier, he attained the greatest height on record, about 7 m. His companion became insensible, and he himself, unable to use his frost-bitten hands, opened the gas-valve with his teeth, and made an extremely rapid but safe descent. The result of this and other aerial voyages by Coxwell and Glashier was the making of some important contributions to the science of meteorology. Coxwell was most pertinacious in urging the practical utility of employing balloons in time of war. He says: “I had hammered away in The Times for little less than a decade before there was a real military trial of ballooning for military purposes at Aldershot.” His last ascent was made in 1885, and he died on the 5th of January 1900.

See his My Life and Balloon Experiences (1887).
COYOTE, the Indian name for a North American member of the dog family, also known as the prairie-wolf, and scientifically as *Canis latrans*. Ranging from Canada in the north to Guatemala in the south, and chiefly frequenting the open plains on both sides of the chain of the Rocky Mountains, the coyote, under all its various local phases, is a smaller animal than the true wolf, and may apparently be regarded as the New World representative of the jackals, or perhaps, like the Indian wolf (*C. pallipes*), as a type intermediate between wolves and jackals. In addition to its inferior size, the coyote is also shorter in the leg than the wolf, and carries a more luxuriant coat of hair. The average length is about 40 in., and the general tone of colour tawny mingled with black and white above and whitish below, the tail having a black tip and likewise a dark gland-patch near the root of the upper surface. There is, however, considerable local variation both in the matter of size and of colour from the typical coyote of Iowa, which measures about 50 in. in total length and is of a full rich tint. The coyote of the deserts of eastern California, Nevada and Utah is, for instance, a smaller and paler-coloured animal, whose length is usually about 42 in. On this and other local variations a number of nominal species have been found; but it is preferable to regard them in the light of geographical phases or races only. The members of *Canis latrans* of Nevada and Utah, *C. l. meansi* of Arizona and Sonora, and *C. l. frasser* of Oklahoma and the Arkansas River district.

It is to distinguish them from the grey, or timber, wolves that coyotes have received the name of "prairie-wolves"; the two titles indicating the nature of the respective habitats of the two species. Coyotes are creatures of slinking and stealthy habits, living in burrows in the plains, and hunting in packs at night, when they utter yapping cries and blood-curdling yells as they gallop. Hares ("jack-rabbits"!), chipmunks or ground-squirrels, and mice form a large portion of their food; but coyotes also kill the fawns of deer and prongbuck, as well as sage-hens and other kinds of game-birds. "In the flat lands," write Messrs. Witter Stone and W. E. Cram, in their *American Animals* (1902), "they dig burrows for themselves or else take possession of those already made by badgers and prairie-dogs. Here in the spring the half-dozen or more coyote pups are brought forth; and it is said that at this season the old ones systematically drive any large game they may be chasing as near to their burrow, where the young coyotes are waiting to be fed, as possible before killing it, if possible. Having thus dragged it any great distance, they leave it again after jack-rabbits two coyotes usually work together. When a jack-rabbit starts up before them, one of the coyotes bounds away in pursuit while the other squats on his haunches and waits his turn, knowing full well that the hare prefers to run in a circle, and will soon come round again, when the second wind takes up the chase and the other rests in his turn... When hunting antelope (prongbuck) and deer the coyotes spread out their pack into a wide circle, endeavouring to surround their game and keep it running inside their ring until exhausted. Sage-hens, grouse and small birds the coyote hunts successfully alone, quartering over the ground like a trained pointer until he succeeds in locating his bird, when he drops flat in the grass and creeps forward like a cat until close enough for the final spring."

When hard put to it for food, coyotes will, it is reported, eat hips, juniper-berries and other wild fruits. (R. L.)

COYPEL, the name of a French family of painters. Noel Coypel (1660-1734), also called, from the fact that he was much influenced by Poussin, *Coypel le Poussin*, was the son of an unsuccessful painter. Having been employed by Charles Errard to paint some of the pictures required for the Louvre, and having afterwards gained considerable fame by other pictures produced at the command of the king, in 1672 he was appointed director of the French Academy at Rome. After four years he returned to France; and not long after he became director of the Academy of Painting. The Martyrdom of St James in Notre Dame is perhaps his finest work. His son, Antoine Coypel (1661-1722), was still more celebrated than his father. Antoine studied under his father, with whom he spent four years at Rome. At the age of eighteen he was admitted into the Academy of Painting, of which he became professor and rector in 1707, and director in 1714. In 1716 he was appointed king's painter, and he was ennobled in the following year. Antoine Coypel received a careful literary education, the effects of which appear in his works; but the graceful imagination displayed by his pictures is marred by the fact that he was not superior to the artistic taste of his age. He was a clever etcher, and engraved several of his own works. His *Discours prononcés dans les conférences de l'Académie royale de Peinture,* &c.; appeared in 1741.

Antoine's half-brother, Noël Nicholas Coypel (1692-1734), was also an exceedingly popular artist; and his son, Charles Antoine (1694-1752), was painter to the king and director of the Academy of Painting. The latter published interesting academical lectures in *Le Mercure* and wrote several plays which were acted at court, but were never published.

COYPU, the native name of a large South American aquatic rodent mammal, known very generally among European residents in the country as nutria (the Spanish word for otter) and scientifically as *Myocastor (or Myopotamus) coypu*. Its large size, aquatic habits, partially webbed hind-toes, and the smooth, orange-coloured incisors, are sufficient to distinguish this rodent from the others belonging to the *Coypidae*. Coypu are abundant in the fresh waters of South America, even small ponds being often tenanted by one or more pairs. Should the water dry up, the coypu seek fresh homes. Although subsisting to a considerable extent on aquatic plants, these rodents frequently come ashore to feed, especially in the evening. Several young are produced at a birth, which are carried on their mother's back when swimming. The fur is of some commercial value, although rather stiff and harsh; its colour being reddish-brown. (See Rodentia.)

COYSEVOX, CHARLES ANTOINE (1640-1720), French sculptor, was born at Lyons on the 29th of September 1640, and belonged to a family which had emigrated from Spain. The name should be pronounced Coëzevo. He was only seventeen when he produced a statue of the Madonna of considerable merit; and having studied under Lernambert and trained himself by taking copies in marble from the Greek masterpieces (among others from the Venus de Medici and the Castor and Pollux), he was engaged by the bishop of Strassburg, Cardinal Fürstenberg, to adorn with statues his château at Saverne (Zabern). In 1666 he married Marguerite Quillet, and his first wife, who died a year after the marriage. In 1671, after four years spent on Saverne, which was subsequently destroyed by fire in 1780, he returned to Paris. In 1676 his bust of the painter Le Brun obtained admission for him to the Académie Royale. A year later he married Claude Bourdichet. In consequence of the influence exercised by Le Brun between the years 1677 and 1685, he was employed by Louis XIV. in producing much of the decoration and a large number of statues for Versailles; and he afterwards worked, between 1701 and 1709, with no less facility and success, for the palace at Marly, subsequently destroyed in the Revolution.

Among his works are the "Mercury and Fame," first at Marly and afterwards in the gardens of the Tuileries; "Neptune and Amphitrite," in the gardens at Marly; "Justice and Force," at Versailles; and statues, in which the likenesses are said to have been remarkably successful, of most of the celebrated men of his age, including Louis XIV. and Louis XV. At Versailles, Colbert (at Saint-Eustache), Marazin (in the church des Quatre-Nations), Cardinal de Guise (in the Louvre), Maria Theresa of Austria, Turenne, Vauban, Cardinals de Boulain and de Polignac, Fénélon, Racine, Bossuet (in the Louvre), the comte d'Harcoeur, Cardinal Fürstenberg and Charles Le Brun (in the Louvre). Coysevox died in Paris on the 10th of October 1720.

Besides the works given above he carved about a dozen memorials, including those to Colbert (at Saint-Eustache), to Cardinal Marazin (in the Louvre), and to the painter Le Brun (in the church of Saint Nicolas-du-Chardon).
Among the pupils of Coysevox were Nicolas and Guillaume Coustou.

See Henry Jouin, A. Coysevox, sa vie, son œuvre (1883); Jean du Seigneur, Revue universelle des arts, vol. i. (1855), pp. 32 et seq.

CRAB (Ger. Krabbe, Krebe), a name applied to the Crustacea of the order Brachyura, and to other forms, especially of the order Anomura, which resemble them more or less closely in appearance and habits.

The Brachyura, or true crabs, are distinguished from the long-tailed lobsters and shrimps which form the order Macrura, by the fact that the abdomen or tail is of small size and is carried folded up under the body. In most of them the body is transversely oval or triangular in outline and more or less flattened, and is covered by a hard shell, the carapace. There are five pairs of legs. The first pair end in nippers or chelae and are usually much more massive than the others which are used in walking or swimming. The eyes are set on movable stalks and can be withdrawn into sockets in the front part of the carapace. There are six pairs of jaws and foot-jaws (maxillipeds) enclosed within a "buccal cavern," the opening of which is covered by the broad and flattened third pair of foot-jaws. The abdomen is usually narrow and triangular in the males, but in the females it is broad and rounded and bears appendages to which the eggs are attached after spawning (fig. 1).

As in most Crustacea, the young of nearly all crabs, when newly hatched, are very different from their parents. The first larval stage is known as a Zoa, this name having been given to it when it was believed by naturalists to be a distinct and independent species of animal. The Zoa is a minute transparent organism, swimming at the surface of the sea. It has a rounded body, armed with long spines, and a long segmented tail. The eyes are large but not set on stalks, the legs are not yet developed, and the foot-jaws form swimming p a d d l e s. After casting its skin several times as it grows in size, the young crab passes into a stage known as the Megalopa (fig. 2), also formerly regarded as an independent animal, in which the body and limbs are more crab-like, but the abdomen is large and not filled up. After a further moult the animal assumes a form very similar to that of the adult. There are a few crabs, living on land or in fresh water, which do not pass through a metamorphosis but leave the egg as miniature adults.

Most crabs live in the sea, and even the land-crabs, which are abundant in tropical countries, nearly all visit the sea occasionally and pass through their early stages in it. Many shore-crabs living between tide-marks are more or less amphibious, and the river-crab of southern Europe or Lenten crab (Potamon edule, better known as Thelphusa fluviatilis) is an example of the freshwater crabs which are abundant in most of the warmer regions of the world. As a rule, crabs breathe by gills, which are lodged in a pair of cavities at the sides of the carapace, but in the true land-crabs the cavities become enlarged and modified so as to act as lungs for breathing air.

Walking or crawling is the usual mode of locomotion, and the peculiar sidelong gait familiar to most people in the common shore-crab, is characteristic of most members of the group. The crabs of the family Portunidae, and some others, swim with great dexterity by means of their flattened paddle-shaped feet.

Like many other Crustacea, crabs are often omnivorous and act as the scavengers of the sea, but many are predatory in their habits and some are content with a vegetable diet.

Though no crab, perhaps, is truly parasitic, some live in relations of "commensalism" with other animals. The best known examples of this are the little "mussel-crabs" (Pinotheridae) which live within the shells of mussels and other bivalve mollusca and probably share the food of their hosts. Some crabs live among corals, and one species at least gives rise to hollow swellings on the branches of a coral like the "galls" which are formed on plants by certain insects. Another crab (Melita tessellata) carries in each of its claws a living sea-anemone which it uses as an animated weapon of defence and an implement for the capture of prey. Many of the sluggish spider-crabs (Majoidea) have their shells covered by a forest of growing sea-weeds, zoophytes and sponges, which are "planted" there by the crab itself, and which afford it a very effective disguise.

Many of the larger crabs are sought for as food by man. The most important and valuable are the edible crab of British and European coasts (Cancer pagurus) and the blue crab of the Atlantic coast of the United States (Callinectes sapidus). Among the Anomura, the best known are the hermit-crustaceans, which live in the empty shells of Gastropod Mollusca, which they carry about with them as portable dwellings. In these, the abdomen is soft-skinned and spirally twisted so as to fit into the shells which they inhabit. The common hermit-crab of the British coasts (Pagurus or Eupagurus Bernhardus) is sometimes called the soldier-crab from its pugnacity. Small specimens are found between tide-marks inhabiting the shells of periwinkles and other small molluscs, but the full-grown specimens live in deeper water and are usually found in the shell of the whelk (Buccinum). As the crab grows it changes its dwelling from time to time, often having to fight with its fellows for the possession of an empty shell. Sometimes an annelid worm lives inside the shell along with the hermit and often the outside is covered with zoophytes. In some species, as in the British Eupagurus prideauxi, a sea-anemone is constantly fixed to the shell, profiting by the active locomotion of the crab and probably sharing the crumbs of its food, while it affords its host protection by its stinging powers.

In tropical countries the hermit-crabs of the family Coenobitidae live on land, often at considerable distances from the sea, to which, however, they return for the purpose of hatching out their spawn. The large robber-crab or cocoa-nut crab of the Indo-Pacific islands (Birgus latro), which belongs to this family, has given up the habit of carrying a portable dwelling, and the upper surface of its abdomen has become covered by shelly plates. The stories of its climbing palm-trees to get the fruit were long doubted, but it has been seen, and even photographed in the act.

CRABBE

CRABBE, GEORGE (1754–1822), English poet, was born at Aldeburgh in Suffolk on the 24th of December 1754. His family was partly of Norfolk, partly of Suffolk origin, and the name was doubtless originally derived from "crab." His grandfather, Robert Crabbe, was the first of the family to settle at Aldeburgh, where he held the appointment of collector of customs. He died in 1734, leaving one son, George, who practised many occupations, including that of a schoolmaster, in the adjoining village of Orford. Finally the poet's father obtained a small post in the customs of Aldeburgh, married Mary Lodwick, the widow of a publican, and had six children, of whom George was the eldest.

The sea has swept away the small cottage that was George Crabbe's birthplace, but one may still visit the quay at Slaughden, some half-mile from the town, where the father worked and the son was at a later date to work with him. At first attending a dame's school in Aldeburgh, when nine or ten years of age he was sent to a boarding-school at Bungay, and at twelve to a school at Stowmarket, where he remained two years. His father dreamt of the medical profession for his clever boy, and so in 1768 he went to Wickham Brook near Newmarket as an apothecary's assistant. In 1771 we find him assisting a surgeon at Woodbridge, and it was while here that he met Sarah Elmy. Crabbe was now only eighteen years of age, but he became "engaged" to this lady in 1777. It was not until 1785 that the pair were married. The nine years that followed were made up of painful struggle, through which, however, not only the affection but the purse of his betrothed assisted him. About the time of Crabbe's return from Woodbridge to Aldeburgh he published at Ipswich his first work, a poem entitled Inebriety (1775). He found his father fallen on evil days. There was no money to assist him to a partnership, and surgery for the moment seemed out of the question. For a few weeks Crabbe worked as a common labourer, rolling butter casks on Slaughden quay. Before the year was out, however, the young man bought on credit "the shatered furniture of an apothecary's shop and the drugs that stocked it." This was at Aldeburgh. A year later Crabbe installed a deputy in the surgery and paid his first visit to London. He lodged in Whitechapel, took lessons in midwifery and walked the hospitals. Returning to Aldeburgh after nine months— in 1777—he found his practice gone. Even as a doctor for the poor he was an utter failure, poetry having probably taken too firm a hold upon his mind. At times he suffered hunger, so utterly unable was he to earn a livelihood. After three years of this, in 1780 Crabbe paid his second visit to London, enabled thereto by the loan of five pounds from Dudley Lang, a local magistrate. He returned to London, and found on his return to Aldeburgh that "the Unity" smacks, for Crabbe a successful career. His poem The Candidate, issued soon after his arrival, helped not at all. For a time he almost starved, and was only saved, it is clear, by gifts of money from his sweetheart Sarah Elmy. He impartoned the great, and the publishers also. Everywhere he was refused, but at length a letter which reached Edmund Burke in March 1781 led to the careful consideration on the part of that great man of Crabbe's many manuscripts. Burke advised the publication of The Library, which appeared in 1781. He invited him to Beaconsfield, and made interest in the right quarters to secure Crabbe's entry into the church. He was ordained in December 1781 and was appointed curate to the rector of Aldeburgh.

Crabbe was not happy in his new post. The Aldeburgh folk could not reverence as priest a man they had known as a day labourer. Crabbe again appealed to Burke, who persuaded the duke of Rutland to make him his chaplain (1782), and Crabbe took up his residence in Belvoir Castle, accompanying his new patron to London, when Lord Chancellor Thurlow (who told him he was "as like Parson Adams as twelve to the dozen") gave him the two livings of Frome St Quentin and Evershot in Dorsetshire, worth ten a year. In August 1783 in Crabbe's poem The Village was published by Dodsley, and in December of this year he married Sarah Elmy. Crabbe continued his duties as ducal chaplain, being in the main a non-resident priest so far as his Dorsetshire parishes were concerned. In 1785 he published The Newspaper. Shortly after this he moved with his wife from Belvoir Castle to the parsonage of Stathern, where he took the duties of the non-resident vicar Thomas Parke, archdeacon of Stamford. Crabbe was thus at them for four years. In 1789, through the persuasion of the duchess of Rutland (now a widow, the duke having died in Dublin as lord-lieutenant of Ireland in 1787), Thurlow gave Crabbe the two livings of Muston in Leicestershire and West Allington in Lincolnshire. At Muston parsonage Crabbe resided for twelve years, divided by a long interval. He had been four years at Muston when his wife inherited certain interests in a property of her uncle's that placed her and her husband in possession of Ducking Hall, Parham, Suffolk. Here he took up his residence from 1793 to 1796, leaving curates in charge of his two livings. In 1796 the loss of their son Edmund led the Crabbes to remove from Parham to Great Glenham Hall, Suffolk, where they lived until 1801. In that year Crabbe went to live at Rendham, a village in the same neighbourhood. In 1805 he returned to Muston. In 1807 he broke a silence of more than twenty years by the publication of The Parish Register, in 1810 of The Borough, and in 1812 of Tales in Verse. In 1813 Crabbe's wife died, and in 1814 he was given the living of Trowbridge, Wiltshire, by the duke of Rutland, a son of his early patron, who, it is interesting to recall, wanted the living of Muston for a cousin of Lord Byron. From 1814 to his death in 1822 Crabbe resided at Trowbridge.

The last years were the most prosperous of his life. He was a constant visitor to London, and in friendship with all the literary celebrities of the time. "Crabbe seemed to grow young again," remarks his biographer, M. René Huchon. He certainly carried on a succession of mild flirtations, and one of his parishioners, Charlotte Ridout, would have married him. The elderly widow had proposed to her and had been accepted in 1814, but he drew out of the engagement in 1816. He proposed to yet another friend, Elizabeth Charter, somewhat later. In his visits to London Crabbe was the guest of Samuel Rogers, in St James's Place, and was a frequent visitor to Holland House, where he met his brother poets Moore and Campbell. In 1817 his Tales of the Hall were completed, and John Murray offered £3000 for the copyright, Crabbe's previous works being included. The offer after much negotiation was accepted, but Crabbe's popularity was now on the wane.

In 1822 Crabbe went to Edinburgh on a visit to Sir Walter Scott. The adventure, complicated as it was by the visit of George IV. about the same time, is most amusingly described in Lockhart's biography of Scott, although one episode—that of the broken wine-glass— is discreetly by Crabbe's biographer, M. René Huchon. Crabbe died at 5 Trowbridges on the 3rd of February 1822, and was buried in Trowbridge church, where an ornate monument was placed over his tomb in August 1823.

Never was any poet at the same time so great and continuous a favourite with the critics, and yet so conspicuously allowed to fall into oblivion by the public. All the poets of his earlier and his later years, Cowper, Scott, Byron, Shelley in particular, have been reprinted again and again. With Crabbe it was long quite otherwise. His works were collected into eight volumes, the first containing his life by his son, in 1832. The edition was intended to continue with some of his prose writings, but the reception of the eight volumes was not sufficiently encouraging. A reprint, however, in one volume was made in 1847, and it has been reprinted since 1844, 1867 and 1901. The exhaustion of the copyright, however, did no good for Crabbe's reputation, and it was not until the end of the century that sundry volumes of "selections" from his poems appeared; Edward FitzGerald, of Omar Khayyam fame, always a loyal admirer, made a "Selection," privately printed by Quaritch, in 1879. A "Selection" by Bernard Holland appeared in 1899, another by C. H. Herford in 1902 and a third by Deane in 1903. The Complete Works were published by the Cambridge University Press in three volumes, edited by A. W. Ward, in 1906.

Crabbe's poems have been praised by many competent pens, by Edward FitzGerald in his Letters, by Cardinal Newman in his Apologia, and by Sir Leslie Stephen in his Hours in a Library, most notably. His verses comforted the last hours of Charles.
James Fox and Sir Walter Scott, while Thomas Hardy has acknowledged their influence on the realism of his novels. But his works have ceased to command a wide public interest. He just failed of being the artist in words who is able to make the same appeal in all ages. Yet to-day his poems will well repay perusal. His stories are profoundly poignant and when once read are never forgotten. He is one of the great realists of English fiction, for even considered as a novelist he makes fascinating reading. He is more than this: for there is true poetry in Crabble, although his most distinctively lyric note was attained when he wrote under the influence of opium, to which he became much addicted in his later years.

Bibliography.—The Works of Crabb (8 vols., Murray, 1834; 1 vol., Murray, 1901), and the Works in the Cambridge Press Classics, edited by A. W. Ward (1903), have now been republished in the Everyman's Library by G. P. Putnam. The Life of the Rev. George Crabble, LL.B., by his son the Rev. George Crabble, A.M. (1834), has not been separately reprinted as it deserves to be. A recent biography is George Crabb and His Times, 1754-1812; A Critical and Biographical Study, by René Hachon, translated from the French by Frederick Clarke (1907). Brief biographies by T. H. Kebbel ("Great Writers" series) and by Canon Ainger ("English Men of Letters" series) also deserve attention.

CRACKER (from "crack," a common Teutonic word, cf. Ger. krachen, Dutch kraken, meaning to break with a sharp sound), that which "cracks"; it is, therefore, applied (1) to a firewood so constructed that it explodes with several reports and jumps in each explosion, when placed on the ground; (2) to a roll of sand or sand-paper with a cutting-edge, used by carpenters in sanding down furniture; (3) to a strip of cardboard, with a coating of a mixture which explodes with a "crack" on being pulled; (4) to a thin crisp biscuit (q.v.); in America the general name for a biscuit. In the southern states of America, "cracker" is a term of contempt for the "poor" or "mean whites," particularly of Georgia and Florida; the term is an old one and dates back to the Revolution, and is supposed to be derived from the "cracked corn" which formed the staple food of the class to whom the term refers.

CRACOW (Pol. Krakow; Ger. Krakau), a town and episcopal see of Austria, in Galicia, 212 m. W. by N. of Lemberg by rail. Pop. (1900) 91,310, of which 21,000 were Jews, 5000 Germans and the remainder Poles. Although in regard to its population it is only the second place in Galicia, Cracow is the most interesting town in the whole of Poland. No other Polish town possesses so many old and historic buildings, none of them contains so many national relics, or has been so closely associated with the development and destinies of Poland as Cracow. And the ancient capital is still the intellectual centre of the Polish nation. Cracow is situated on a small plain drained by the Vistula (which becomes navigable here) and occupies a position of great strategic importance. It consists of the old inner town and seven suburbs. The only relics of the fortifications of the old town, whose place is now occupied by shady promenades, is the Florian's Gate and the Rondell, a circular structure, built in 1498. Cracow has 39 churches—about half the number it formerly had—and 25 convents for monks and nuns. Of these the most important is the Stanislaus cathedral, in Gothic style, consecrated in 1359, and built on the Wawel, the rocky eminence to the S.W. of the old town. Here the kings of Poland were crowned, and this church is also the Pantheon of the Polish nation, the burial place of its kings and its great men. Here lie the remains of John Sobieski, of Thaddeus Kosciusko, of Joseph Pociatski and of Adam Mickiewicz. Here also are conserved the remains of St Stanislaus, the patron saint of the Poles, who, as bishop of Cracow, was slain before the altar by King Boleslaus in 1079. The cathedral is adorned with many valuable objects of art, paintings and sculptures, by such artists as Veit Stoss, Guido Reni, Peter Vischer, Thorwaldsen, etc. Part of the ancient Polish regalia is also kept here. The Gothic church of St Mary, founded in 1223, rebuilt in the 14th century, with several chapels added in the 15th and 16th centuries, was restored in 1889-1893, and decorated with paintings from the designs by Matejko. It contains a huge high altar, the masterpiece of Veit Stoss, who was a native of Cracow, executed in 1477-1489; a colossal stone crucifix, dating from the end of the 15th century, and several sumptuous tombs of noble families from the 16th and 17th centuries. The Dominican church, a Gothic building of the 13th century, but practically rebuilt after a fire in 1850; the Franciscan church, also of the 13th century, much modernized; the church of St Florian of the 12th century, rebuilt in 1768, which contains the late-Gothic altar by Veit Stoss, executed in 1518, during his last sojourn in Cracow; the church of St Peter, with a colossal dome, built in 1507, after the model of that of St Peter at Rome, and the beautiful Augustinian church in the suburb of Kazimierz, are all worth mentioning. Of the principal secular buildings, the royal castle (Zamek Królewski), a huge building, begun in the 13th century, and successively enlarged by Casimir the Great and by Sigismund I. Jagiello (1510-1533), is situated on the Wawel, and was until 1610 the residence of the Polish kings. It suffered much from fires and other disasters, and from 1846 onward was used as a barracks and a military hospital; it has now, however, been cleared out and restored. The Jagiellonian university, now housed in a magnificent Gothic building erected in 1881-1887, was attended in 1901 by 1253 students, and had 175 professors and lecturers. The language of instruction is Polish. It is the second oldest university in Europe—the oldest being that of Prague—and was famous during the 15th and 16th centuries. It was founded by Casimir the Great in 1364, and completed by Ladislaus Jagiello in 1400. Its rich library is housed in the old university buildings, erected in the 15th century, in the beautiful Gothic court of which a bronze statue of Copernicus was placed in 1900. The Polish Academy of Science, founded in 1872, is housed in the new university buildings. In the Ring-Platz, or the principal square, opposite the church of St Mary, is the Tuchhaus (cloth-hall, Pol. Sukienicke), a building erected in 1257, several times renovated and enlarged, most recently in 1879, which contains the Polish national museum of art. Behind it is a Gothic tower, the only relic of the old town hall, demolished in 1820. The Czartoryski museum contains a large collection of objects of art, a rich library and a precious collection of manuscripts, relating to the history of Poland.

Among the manufactures of the town are machinery, agricultural implements, chemicals, soap, tobacco, &c. But Cracow is more important as a trading than as an industrial centre. Its position on the Vistula and at the junction of several railways makes it the natural mart for the exchange of the products of Silesia, Hungary and Russian and Austrian Poland. Its trade in timber, salt, textiles, cattle, wine and agricultural produce of all kinds is very considerable. In the neighbourhood of Cracow there are the mines of coal and zinc, and the salt-lakes in the village of Krezesowice with sulphur baths. About 2½ m. N.W. lies the Kosciuszkko Hill, a mound of earth 700 ft. high, thrown up in 1820-1823 on the Borislawa hill (1093 ft.), in honour of Tadeus Kosciusko, the hero of Poland. On the opposite bank of the Vistula, united to Cracow by a bridge, lies the town of Podgorze (pop. 18,142); near it is the Krakus Hill, smaller than the Kosciuszkko Hill, and a thousand years older than it, erected in honour of Krakus, the founder of Cracow. About 8 m. S.E. of Cracow is situated Wieliczka (q.v.), with its famous salt mines.

History.—Tradition assigns the foundation of Cracow to the mythical Krak, a Polish prince who is said to have built a stronghold here about A.D. 700. Its early history is, however, entirely obscure. In the latter part of the 10th century it was annexed to the Bohemian principality, but was recaptured by Boleslaus Chrobry, who made it the seat of a bishopric, and it became the capital of one of the most important of the principalities into which Poland was divided from the 12th century onwards. The city was practically ruined during the first Tatar invasion in 1241, but the introduction of German colonists restored its prosperity, and in 1255 it received "Magdeburg rights," i.e. a civic constitution modelled on that of Magdeburg. In this year the Tuchhalle was built. The town, however, had yet to pass through many vicissitudes. It suffered again from Tatar invasions; in 1290 it was captured by Wenceslaus II. of Bohemia and was held by the Bohemians until in 1305, the Polish king
Ladislaus Lokietek recovered it from Wenceslaus III. Ladislaus made it his capital, and from this time until 1574 it remained the coronation and burial place of the Polish kings, even after the royal residence had been removed by Siegmund III. (1587–1632) to Warsaw. On the third partition of Poland in 1795 Austria took possession of Cracow, but in 1809 Napoleon wrested it from that power, and incorporated it with the duchy of Warsaw, which was placed under the rule of the king of Saxony. In the campaign of 1812 the emperor Alexander made himself master of this and the other territory which formed the duchy of Warsaw. At the general settlement of the affairs of Europe by the great powers in 1815, it was agreed that Cracow and the adjoining territory should be formed into a free state; and, by the Final Act of the congress signed at Vienna in 1815, "the town of Cracow, with its territory, is declared to be for ever a free, independent and strictly neutral city, under the protection of Russia, Austria and Prussia."

In February 1840, however, an insurrection broke out in Cracow, apparently a ramifications of a widely spread conspiracy throughout Poland. The senate and the other authorities of Cracow were unable to subdue the rebels or to maintain order, and, at their request, the city was occupied by a corps of Austrian troops for the protection of the inhabitants. The three powers, Russia, Austria and Prussia, made this a pretext for extinguishing this independent state; and as the outcome of a conference at Vienna (November 1840) the three courts, contrary to the assurance previously given, and in opposition to the expressed views of the British and French governments, decided to extinguish the state of Cracow and to incorporate it with the dominions of Austria.

**CRADDOCK, CHARLES EGBERT** (1850– ), the pen-name of MARY NOAILES MURFREE, American author, who was born near Murfreesboro, Tennessee, on the 24th of January 1850, the great-granddaughter of Col. Hardy Murfree. She was crippled in childhood by paralysis. She attended school in Nashville and Philadelphia. Spending her summers in the mountains of eastern Tennessee, she came to know the primitive people there with whose life her writings deal. She contributed to Appleton’s Journal, and, first in 1878, to The Atlantic Monthly. No one, apparently, suspected that the author of these stories was a woman, and her identity was not disclosed until 1885, a year after the publication of her first volume of short stories, In the Tennessee Mountains. She deals mainly with the narrow, stern life of the Tennessee mountaineers, who, left behind in the advance of civilization, live amid traditions and customs, and speak a dialect, peculiarly their own; and her work abounds in exquisite descriptions of scenery. Among her other books are: Where the Battle was Fought (1884), a novel dealing with the old aristocratic southern life; Down the Ravine (1885) and The Story of Keedon Bluffs (1887) for young people; The Prophet of the Great Smoky Mountains (1883), a novel; In the Clouds (1880), a novel; The Desert of Broomsedge Cave (1888), a novel; In the “Stranger-People’s” Country (1892); His Vanished Star (1894), a novel; The Mystery of Witch-Face Mountain and Other Stories (1895); The Adventures of the Tootbridge and Other Stories (1895); The Young Mountainmen (1897), short stories; The Jugger (1897); The Story of Old Fort Loudon (1899); The Buckskickers and Other Stories (1899); The Champion (1902); A Spectre of Power (1903); The Frontiersman (1904); The Storm Centre (1905); The Amulet (1906); The Winful (1907); and Fair Mississippian (1908).

**CRADLE** (of uncertain etymology, possibly connected with “crate” and “creel,” i.e. basket; the derivation from a Celtic word, with a sense of rocking, is sought by the New English Dictionary), a child’s bed of wood, wicker or iron, with enclosed sides, slung upon pivots or mounted on rockers. It is a very ancient piece of furniture, but the date when it first assumed its characteristic swinging or rocking form is by no means clear. A miniature in an illuminated Histoire de la belle Heloise in the Bibliothèque Nationale in Paris (end of the 14th or beginning of the 15th century) shows an infant sleeping in a tiny four-post bed slung upon rockers. In its oldest forms the cradle is an oblong oak box without a lid—originally the rockers appear to have been detachable—but, like all other household appliances, it has been subject to changes of fashion alike in shape and adornment. It has been panelled and carved; on Renaissance pillars, inlaid with marqueterie or mounted in gilded bronze. The original simple shape persisted for two or three centuries—even the hood made its appearance very early. In the 18th century, however, cradles were often very elaborate—indeed in France they had begun to be so much earlier, but the richly carved and upholstered examples were used chiefly for purposes of state, being in fact miniature lits de parade. In modern times they have become lighter and simpler, the old hood being very often replaced by a draped curtain dependent from a carved or shaped upright. About the middle of the 19th century iron cradles were introduced, along with iron bedsteads. A number of undoubted historic cradles have been preserved, together with many others with doubtful attributions. Two alleged cradles of Henry V. exist; one which claims to have been used by the unhappy earl of Derwentwater is in the Victoria and Albert Museum in London; the other is at Windsor Castle. That of Henry IV. of France, now in the Château de Pau, is mounted upon a large tortoise-shell. That of the king of Rome ("Napoleon II.") was designed by Prud’hon, and along with that of the comte de Chambord is preserved in the Garde Meuble. In England a cradle is now often called a “bassinet” (i.e. little basket), and the “cot” has to some extent taken its place. By analogy, the word “cradle” is also applied to various sorts of framework in engineering, and to a rocking-tool used in engraving.

**CRADock, a town of South Africa, capital of a division of the Cape province, in the upper valley of the Great Fish river, 181 m. by rail N. by E. of Port Elizabeth. Pop. (1904) 7762. It is one of the chief centres of the wool industry of the Cape, and does also a large trade in ostrich feathers, mohair, &c. The town enjoys a reputation as one of the best health resorts in the province. It stands at an altitude of 2856 ft.; the climate is very dry, the average annual rainfall being 14.50 in. The mean maximum temperature is 77°F. Three miles N. of the town are sulphur baths (temp. 100° F.) used for the treatment of rheumatism. In the neighbouring district survive a few herds of zebras, now protected by the game laws. The town dates from the beginning of the 19th century and is named after Sir John Craddock, governor of the Cape 1811–1813. The division has an area of 3048 sq. m. and a pop. (1904) of 13,803, of whom 41% are white.

**CRAFT** (a word common to Teutonic languages for strength, or power; cf. Ger. Kraft), a word confined in English only, of the Teutonic languages in which it occurs, to intellectual power, and used as a synonym of “art.” It then means skill or ingenuity, especially in the manual arts, hence its use in the expression “Arts and Crafts” (q.v.), and it is thus applied to the trade or profession in which such skill is displayed, to an association of workmen of a particular trade, a trade guild, and in particular to Freemasons, “the craft”; the word appears also in words such as “handicraft” or “craftsmanship.” Skill especially, outwitting the opponent, gives the composite sense of cunning in dealing with tricky, and it is this meaning which is implied in such combined words as “prieestcraft,” “witchcraft” and the like. A more particular use of the word is in the nautical sense of vessels of transport by water; this is probably a colloquially shortened form either of “vessels of a fisherman’s, lighterman’s &c., craft,” i.e. “art,” or of “vessels of a heavier or lighter craft,” i.e. burden or capacity; in both cases the qualifying words are dropped and the word comes to be used of vessels in general.

**CRAG** (a Celtic word, cf. Gael. creag, Manx creeg, and Welsh and modern Scots craig), a steep rock. The word appears in many place-names in the north of England and in Scotland, and is also connected with “carrick,” a word of similar meaning, also found in place-names. In geology, the term is applied to the strata in which a shelly sand deposit is found, and, in the expression “crag and tail,” to a formation of hills, in which one side is precipitous and lofty and the other slopes or “tails” gradually away, as in the Castle Rock in Edinburgh.
CRAGGS—CRAIG

CRAGGS, JAMES (1657–1721). English politician, was a son of Anthony Crags of Holbeck, Durham, and was baptized on the 10th of June 1657. After following various callings in London, Craggs, who was a person of considerable financial ability, entered the service of the duchess of Marlborough, and through her influence became in 1702 member of parliament for Grampound, retaining his seat until 1713. He was in business as an army clothier and held several official positions, becoming joint postmaster-general in 1715; and, making the most of his opportunities in all these capacities, he amassed a great deal of money. Craggs also increased his wealth by mixing in the affairs of the South Sea Company, but after his death an act of parliament confiscated all the property which he had acquired since December 1719. He left an enormous fortune when he died on the 16th of March 1721. It is possible that Craggs committed suicide.

His son, JAMES CRAGGS the younger (1686–1721), was born at Westminster on the 9th of April 1686. Part of his early life was spent abroad, where he made the acquaintance of George Louis, elector of Hanover, afterwards King George I. In 1713 he became member of parliament for Tregony, in 1717 secretary-at-war, and in the following year one of the principal secretary of state. Craggs was implicated in the South Sea Bubble, but not so deeply as his father, whom he predeceased, dying on the 16th of February 1721. Among Craggs’s friends were Pope, who wrote the epitaph on his monument in Westminster Abbey, Addison and Gay.

CRAIG, JOHN (1512?–1600), Scottish reformer, born about 1512, was the son of Craig of Craigston, Aberdeenshire, who was killed at Flodden in 1513. After an education at St Andrews, and acting as tutor to the children of Lord Darcy, the English warden of the North, he became a Dominican, but was soon in trouble as a heretic. In 1536 he made his way to England, but failing to obtain the prelament he desired at Cambridge, he went on to Italy, where the influence of Cardinal Pole, who was himself accused of heresy, secured him the post of master of the novices in the Dominican convent at Bologna. For some years he was busy travelling in the Levant in the interests of his order, but a purusal of Calvin’s Institutes revived his heretical tendencies, and he was condemned to be burnt. Like the English scholars and statesmen, the Thomists in Craig’s day, he was the hero of an act which broke out on the death of Paul IV. on the 18th of August 1555, when the mob burst open the prison of the Inquisition. After various adventures he reached Vienna, where he preached, and was protected by the semi-Lutheran archduke (afterwards the emperor) Maximilian II.

In 1560 he returned to Scotland, where in 1561 he was ordained minister of Holyrood, and in 1562 Knox’s colleague in the High Church. His defence of church property and privilege against the predatory instincts of the nobles and the pretensions of the state brought him into conflict with Lethington and others; but he seems to have condescended, if he was not privy to Riccio’s murder. At first he refused to publish the ban of marriage between Mary and Bothwell, though in the end he yielded with a protest that he “abhorred and detested the marriage.” He had been associated with Knox in various commissions for the organization of the church, but he wished to compromise between the two extreme parties. From 1571–1575 Craig was in the north, whether he had been sent to “illuminate whose dark places in Mar, Buchan and Aberdeen.” In 1570 he was appointed chaplain to the young James VI., and returned to Edinburgh. In 1572 the episcopacy was abolished as a result of the report of a commission on which Craig had sat; he also assisted at the composition of the Second Book of Discipline and the National Covenant of 1559, and in 1581 compiled “Ane Shorte and Generale Confession” called the “King’s Confession,” which was imposed on all parish ministers and graduates and became the basis of the Covenant of 1638. He approved of the Ruthven raid, and admonished James in terms which made him weep, but produced no alteration in his conduct, and before long Craig was denouncing the supremacy of Arran. But he was averse from the violence of Melville, and was willing to admit the royal supremacy “as far as the word of God allows.” James VI., like Henry VIII., accepted this compromise, and the oath in this form was taken by Craig, the royal chaplains and some others. In 1592 was published Craig’s Catechism. He died on the 17th of December 1600.

See T. G. Law’s Pref. to Craig’s Catechism (1885); Bain’s Cal. Scottish State Papers; Reg. P. C. Scotl.; Hew Scott’s Fasti Eccles. Scot.; Knox’s, Calderwood’s and Grub’s Eccles. Histories; McCabe’s Life of Melville; Hay Fleming’s Mary, Queen of Scots; Bain’s Scottish Memorials.

CRAIG, SIR THOMAS (c. 1538–1608), Scottish jurist and poet, was born about 1538. It is probable that he was the eldest son of William Craig of Craignairn, or Craigston, in Aberdeenshire, but beyond the fact that he was in some way related to the Craignairn family nothing regarding his birth is known with certainty. He was educated at St Andrews, where he took the B.A. degree in 1555. From St Andrews he went to France, to study the canon and the civil law. He returned to Scotland about 1561, and was admitted advocate in February 1563. In 1564 he was appointed justice-depute by the justice-general, Archibald, earl of Argyll; and, in this capacity he presided at many of the criminal trials of the period. In 1573 he was appointed sheriff-depute of Edinburgh, and in 1606 procurator for the church. He never became a lord of session, a circumstance that was unquestionably due to his choice of the better branches of knighthood which the king wished to confer on him in 1604, when he came to London as one of the Scottish commissioners regarding the union between the kingdoms—the only political object he seems to have cared about; but in accordance with James’s commands he has always been styled and reputed a knight. Craig was married to Helen, daughter of Heriot of Lumphoy in Midlothian, by whom he had four sons and three daughters. His eldest son, Sir Lewis Craig (1560–1622), was raised to the bench in 1604, and among his other descendants are several well-known names in the list of Scottish lawyers. He died on the 26th of February 1608.

Except his poems, the only one of Craig’s works which appeared during his lifetime was his Jus feudale (1603; ed. R. Burnet, 1655; Leipzig, 1716; ed. J. Baillie 1732). The object of this treatise was to assimilate the laws of England and Scotland, but, instead of this, it was an important factor in building up and solidifying the law of Scotland into a separate system. Other works were De unione regni Britanniae et De hominio disputatae. Translations of the last two have been published, and in 1910 an edition of the De Unione appeared, with translation and notes by C. S. Terry. Craig’s first poem, an Epithalamium in honour of the marriage of Mary queen of Scots and Darnley, appeared in 1565. Most of his poems have been reprinted in the Delitiae poetarum Scotiae. See P. F. Tytler, Life of Craig (1825); Life prefixed to Baillie’s edition of the Jus feudale.

CRAIGIE, PEARL MARY TERESA (1867–1906), Anglo-American novelist and dramatist, who wrote under the pen-name of “JOHN OLIVER HOBBS,” was born at Boston, U.S.A., on the 3rd of November 1867. She was the elder daughter of John Morgan Richards, and was educated in London and Paris. When she was nineteen she married Reginald Walpole Craigie, by whom she had one son, John Churchill Craigie: but the marriage proved an unhappy one, and was dissolved on her petition in July 1895. She was brought up as a Nonconformist, but in 1892 was received into the Roman Catholic Church, of which she remained a devout and serious member. A little book, “Boyhood, and Epimemories,” Some Emotions and a Moral, was published in 1891 in Mr Fisher Unwin’s “Pseudonym Library,” and was followed by The Sinner’s Comedy (1892), A Study in Temptations (1893), A Bundle of Life (1894), The Gods, Some Mortals, and Lord Wickenham, The Herb Moon (1896), a country love story, was followed by The School for Saints (1897), with a sequel, Robert Orange (1900). Mrs Craigie had already written a one-act “proverb,” Journeys end in Lovers Meeting, produced by Ellen Terry in 1894, and a three-act tragedy, “Osburn and Ursyne,” printed in the Anglo-Saxon Review (1896), when her successful piece, The Ambassador, was produced at the St James’s Theatre in 1898. A Repentace (one
act, 1859) and The Wisdom of the Wise (1900) were produced at the same theatre, and The Flute of Pan (1904) first at Manchester and then at the Shaftesbury theatre; she was also part author of The Bishop's Move (Garrick Theatre, 1902). Later books are The Serious Wooing (1901), Love and the Soul Hunters (1902), Tales about Temperance (1902), The Vineyard (1904). Mrs Craik died suddenly of heart failure in London on the 13th of August 1906.

CRAIL, DINAH MARIA (1826-1887), English novelist, better known by her maiden name of Mulock, and still better as "the author of John Halifax, Gentleman," was the daughter of Thomas Mulock, an eccentric religious enthusiast of Irish extraction, and was born on the 20th of April 1836 at Stoke-upon-Trent, in Staffordshire, where her father was the minister of a small congregation. She settled in London about 1846, determined to obtain a livelihood by her pen, and, beginning with fiction for children, advanced steadily until John Halifax, Gentleman (1847), placed her in the front rank of the women novelists of her day. A Life for a Life (1859), though inferior maintained a high position, but she afterwards wrote little of importance except some very charming tales for children. Her most remarkable novels, after those mentioned above, were The Ogilives (1849), Olive (1850), The Head of the Family (1851), Agatha's Husband (1853). There is much passion and power in these early works, and all that Mrs Craik wrote was characterized by high principle and deep feeling. Some of the short stories in Avitlon and other Tales also exhibit a fine imagination. She published some poems distinguished by genuine lyrical spirit, narratives of tours in Ireland and Cornwall, and A Woman's Thoughts about Women. She married Mr G. L. Craik, a partner in the house of Macmillan & Company, in 1864, and died at Shortlands, near Bromley, Kent, on the 12th of October 1889.

CRAIL, GEORGE LILLY (1750-1866), English man of letters, the son of a schoolmaster, was born at Kennoway, Fife-shire, in 1798. He studied at the university of St Andrews with the intention of entering the church, but, altering his plans, became the editor of a local newspaper, and went to London in 1824 to devote himself to literature. He became connected with a short-lived literary paper called the Verulam; in 1831 he published his Pursuit of Knowledge under Difficulties among the works of the Society for the Diffusion of Useful Knowledge; he contributed a considerable number of biographical and historical articles to the Penny Cyclopaedia; and he edited the Pictorial History of England, himself writing much of the work. In 1844 he published his History of Literature and Learning in England from the Norman Conquest to the Present Time, illustrated by extracts. Craik is best known for his abridged version of this work, The History of English Literature and the English Language (1861), which passed through several editions. In the next year appeared his Spencer and his Poetry, an abstract of Spenser's poems, with historical and biographical notes and frequent quotations; and in 1847 his Bacon, his Writings and his Philosophy, a work of a similar kind. The two last-mentioned works appeared among Knight's Weekly Volumes. Two years later Craik obtained the chair of history and English literature at Queen's College, Belfast, a position which he held till his death, which took place on the 25th of June 1866. He had married Miss Jeannette Dempster (d. 1856) in 1826, and his daughter, Georgiana Marion Craik (Mrs A. W. May), wrote over thirty novels, of which Lost and Won (1859) was the best. Besides the works already noticed, Craik published the History of British Commerce from the Earliest Times (1844), Romance of the Peasage (1846-1850) and The English of Shakespeare (1856).

CRAMBO (formerly KAREL), a royal and police borough of Fifeshire, Scotland, 2 m. from Fife Ness, the most easterly point of the coast, and 6 m. from the town of St Andrews by the North British railway, but 2 m. nearer by road. Pop. (1901) 1077. It is said to have been a town of some note as early as the 9th century; and its castle, of which there are hardly any remains, was the residence of David I. and other Scottish kings. It was constituted a royal burgh by a charter of Robert Bruce in 1306, and had its privileges confirmed by Robert II. in 1371, by Mary in 1553, and by Charles I. in 1635. Of its priory, dedicated to St Rufus, a few ruins still exist. The church of Maolrubba, the patron saint of Craib, is an edifice of great antiquity. Many of the ordinary houses are massive and quaint. The public buildings include a library and reading-room and town hall. The chief industries comprise fisheries, especially for crabs, shipping and brewing. It is growing in favour as a summer resort. It unites with St Andrews, the two Anstruther, Kilrenny, Pittenweem and Cupar in returning one member to parliament.

Balcomie Castle, about 2 m. to the N.E., dates from the 14th century. Here Mary of Guise landed in 1538, a few days before her marriage to James V. in St Andrews cathedral. In the 18th century it passed through the hands of various proprietors and was usually shorn of much of its original size and grandeur. The East Neuk is a term applied more particularly to the country round Fife Ness, and more generally to all of the peninsula east of an imaginary line drawn from St Andrews to Elie. For fully half the year the cottages of its villages are damp with the hark of the sooty smoke mists borne on the east wind from the North Sea.

Crailshiem, or Kraileshiem, a town of Germany, in the kingdom of Württemberg, on the Jagst, a tributary of the Neckar, at the junction of railways to Heilbronn and Fürt. Pop. (1900) 6251. There are two Evangelical churches and a Roman Catholic church, and a handsome town hall, with a tower 225 ft. high. The industrial establishments include extensive tanneries and machine workshops, and there is a brisk trade in cattle and agricultural produce.

Crailshiem was incorporated as a town in 1338, successfully withstood a siege by the forces of several Swabian imperial cities (1379-1380), a feat which is annually celebrated, passed later into the possession of the burghers of Nuremberg, and came in 1791 to Prussia, in 1806 to Bavaria and 1810 to Württemberg.

 Craiova, or Kraiova, the capital of the department of Doljș, Rumania, situated near the left bank of the river Jiu, and on the main Walachian railway (from Vercelova to Bucharest). Pop. (1900) 45,438. A branch railway to Calafat facilitates the export trade with Bulgaria. Craiova is the chief commercial town west of Bucharest; the surrounding uplands are very rich in grain, pasturage and vegetable products, and contain extensive forests. The town has rope and carriage factories, and close by is a large tannery, worked by convict labour, and supplying the army. The principal trade is in cattle, cereals, fish, linen, pottery, glue and leather. In the town, which is the head-quarters of the First Army Corps, there are military and commercial academies, an appeal court and a chamber of commerce, besides many churches, Greek Orthodox, Roman Catholic, and Protestant, with synagogues for the Jews.

Craiova, which occupied the site of the Roman Castra Nova, was formerly the capital of Little Walachia. Its ancient bans or military governors were, next to the princes, the chief dignitaries of Walachia, and the district is still styled the banat of Craiova. Among the holders of this office were Michael the Brave (1516-1601), and several members of the celebrated Bassarab family (g.e.). The bans had the right of coined money stamped with their own effigies, and hence arose the name of bani (centimes). The Rumanian franc, or leu ("lion"), so called from the image it bore, came likewise from Craiova. In 1397 Craiova was the scene of a victory won by Prince Mircove over Bayezid I. sultan of the Turks; and in October 1853, of an engagement between Turks and Russians.

CRAMBO, an old rhyming game which, according to Strutt (Sports and Pastimes), was played as early as the 14th century under the name of the ABC of Aristotle. In the days of the Stuarts it was very popular, and is frequently mentioned in the writings of the time. Thus Congreve's Love for Love, i. 1, contains the passage, "Of the Maid's to Crambo in an Evening, and the knack of Rhymes, that Crambo, or capping the rhyme, is now played by one player thinking of a word and telling the others what it rhymes with, the others not naming the actual word they guess but its meaning. Thus one says "I know a word that rhymes with bird." A second asks "Is it ridiculous?" "No, it is not absurd," "Is it a part of speech?" "No, it is not a word." This proceeds until the right word is guessed.
In *Dumb Crambo* the guessers, instead of naming the word, express its meaning by dumb show, a rhyme being given them as a clue.

**Cramer, Johann Baptist** (1771-1858), English musician, of German extraction, was born in Mannheim, on the 24th of February 1771. He was the son of Wilhelm Cramer (1743-1799), a famous London violinist and musical conductor, one of a numerous family who were identified with the progress of music during the 18th and 19th centuries. Johann Baptist was brought to London as a child, and it was in London that the greater part of his musical efforts was exercised. From 1782 to 1784 he studied the pianoforte under Muzio Clementi, and soon became known as a professional pianist both in London and on the continent; he enjoyed a world-wide reputation, and was particularly appreciated by Beethoven. He died in London on the 16th of April 1838. Apart from his pianoforte-playing Cramer is important as a composer, and as principal founder in 1824 of the London music-publishing house of Cramer & Co. He wrote a number of sonatas, &c., for pianoforte, and other compositions; but his *Studies* is the work by which he lives as a composer. These "studies" have appeared in numerous editions, from 1810 onwards, and became the staple pieces in the training of pianists.

**Cramer, John Antony** (1793-1848), English classical scholar and geographer, was born at Mittlodi in Switzerland. He was educated at Westminster and Christ Church, Oxford. He resided in Oxford till 1844, during which time he held many important offices, being public orator, principal of New Inn Hall (which he rebuilt at his own expense), and professor of modern history. In 1844 he was appointed to the deanship of Carlisle, which he held until his death at Scarborough on the 24th of August 1848. His works are of considerable importance: *A Dissertation on the Passage of Hannibal over the Alps*, published anonymously with H. L. Wickham (2nd ed., 1828), "a scholarly work of first-rate ability"; geographical and historical descriptions of *Ancient Italy* (1826), *Ancient Greece* (1828), *Asia Minor* (1832); *Travels of Nicander Nucius of Corycia* [Greek traveller of the 16th century] in *England* (1841); *Catena Graecorum Patrum in Novum Testamentum* (1838-1844); *Anecdota Graeca* (from the MSS. of the royal library in Paris, 1839-1841).

**Cramer, Karl von** (1818-1902), Bavarian politician, had a very remarkable career, rising gradually from a mere workman in a factory at Doss near Nuremberg to the post of manager, and finally becoming part proprietor of the establishment. Leaving business in 1870 he devoted his time entirely to politics. From 1848 he had been a member of the Bavarian second chamber, at first representing the district of Erlangen-Fürth, and afterwards Nuremberg, which city also sent him after the war of 1866 as its deputy to the German customs parliament, and from 1871 to 1874 to the first German Reichstag. He sat in these bodies as a member of the Progressive party (Fortschrittspartei), and in Bavaria was one of the leaders of the Liberal (Freisinnige) party. His eloquence had a great hold upon the masses. As a parliamentarian he was very clear-headed, and thoroughly understood how to lead a party. For many years he was the reporter of the finance committee of the chamber. In 1882, on account of his great services in connexion with the Bavarian National Exhibition of Nuremberg, the order of the crown of Bavaria was conferred upon him, carrying with it the honour of nobility. He died at Nuremberg on the 31st of December 1902.

**Cramp, Charles Henry** (1828- ), American shipbuilder, was born in Philadelphia, Pennsylvania, on the 9th of May 1828, of German descent, his family name having been Kramp. He was the eldest of eleven children of William Cramp (1807-1869), a pioneer American shipbuilder, who in 1830 established shipyards on the Delaware river near Philadelphia. The son was educated at the Philadelphia Central high school, after which he was employed in his father's shipyards and made himself master of every detail of ship construction. He showed especial aptitude as a naval architect and designer, and after becoming his father's partner in 1849 it was to that branch of the work that he devoted himself. His inventive capacity and resourcefulness, together with the complete success of his innovations in naval construction, soon gave him high rank as an authority on shipbuilding, and made his influence in that industry widely felt. In the Mexican War he designed war-boats for the landing of troops at Vera Cruz; during the Civil War he designed and built several ironclads for the United States navy, notably the "New Ironsides" in 1862, and the light-draught monitors used in the Carolina sounds; and after 1887 constructed wholly or in part from his own designs many of the most powerful ships in the "new" navy, including the cruisers "Columbia," "Minneapolis" and "Brooklyn," and the battleships "Indiana," "Iowa," "Massachusetts," "Alaska" and "Maine." In every progressive step in ocean shipbuilding, in the transformation from sail to steam, and from wood to iron and steel, Cramp had a prominent part. His fame as a shipbuilder extended to Europe, and he built warships for several foreign navies, among others the "Revtizan" and the "Variatz" for the Russian government. He also constructed a number of freight and passenger steamships for several trans-Atlantic lines.

**Cramp**, a painful spasmodic contraction of muscles, most frequently occurring in the limbs, but also apt to affect certain internal organs. This disorder belongs to the class of diseases known as local spasms, of which other varieties exist in such affections as spasmodic asthma and colic. The cause of these painful seizures resides in the nervous system, and operates either directly from the great nerve centres, or, as generally the case, indirectly by reflex action, as, for example, when attacks are brought on by some derangement of the digestive organs.

In its most common form, that of cramp in the limbs, this disorder comes on suddenly, often during sleep, the patient being aroused by an agonizing feeling of pain in the calf of the leg or back of the thigh, accompanied in many instances with a sensation of sickness or faintness from the intensity of the suffering. During the paroxysm the muscular fibres affected can often be felt gathered up into a hard knot. The attack in general lasts but a few seconds, and then suddenly departs, the spasmodic contraction of the muscles ceasing entirely, or, on the other hand, relief may come more gradually during a period of minutes or even hours. A liability to cramp is often associated with a rheumatic or gouty tendency, but occasional attacks are common enough apart from this, and are often induced by some peculiar posture which a limb has assumed during sleep. Exposure of the limbs to cold will also bring on cramp, and to this is probably to be ascribed its frequent occurrence in swimmers. Cramp of the extremities is also well known as one of the most distressing accompaniments of cholera. It is likewise of frequent occurrence in the process of parturition, just before delivery.

This painful disorder can be greatly relieved and often entirely removed by firmly grasping or briskly rubbing the affected part with the hand, or by anything which makes an impression on the nerves, such as warm applications. Even a sudden and vigorous movement of the limb will often succeed in terminating the attack.

What is termed cramp of the stomach, or gastralgia, usually occurs as a symptom in connexion with some form of gastric disorder, such as aggravated dyspepsia, or actual organic disease of the mucous membrane of the stomach.

The disease known as *Writer's Cramp*, or *Scriveners' Palsy*, is a spasm which affects certain muscles when engaged in the performance of acts, the result of education and long usage, and which does not occur when the same muscles are employed in acts of a different kind. This disorder owes its name to the relative frequency with which it is met in persons who write much, although it is by no means confined to them, but is liable to occur in individuals of almost any handicraft. It was termed by Dr. Duchenne Functional Spasm.

The symptoms are in the first instance a gradually increasing difficulty experienced in conducting the movements required for executing the work in hand. Taking, for example, the case of writers, there is a feeling that the pen cannot be moved with
CRAMP-RINGS—CRANACH

364

The only clue to Cranach's settlement previous to his Wittenberg appointment is afforded by the knowledge that he owned a house at Gotha, and that Barbara Brengler, his wife, was the daughter of a burgher of that city.

Of his skill as an artist we have sufficient evidence in a picture dated 1504. But as to the development of his manner prior to that date we are altogether in ignorance. In contrast with this obscurity is the light thrown upon Cranach after 1504. We find him active in several branches of his profession,—sometimes a mere house-painter, more frequently producing portraits and altar-pieces, a designer on wood, an engraver of copper-plates, and draughtsman for the dies of the electoral mint. Early in the days of his official employment he startled his master's courtiers by the realism with which he painted still life, game and antlers on the walls of the country palaces at Coburg and Lochau; his pictures of deer and wild boar were considered striking, and the duke fostered his passion for this form of art by taking him out to the hunting field, where he sketched "his grace" running the stag, or Duke John sticking a boar. Before 1508 he had painted several altar-pieces for the Schlosskirche at Wittenberg in competition with Dürrer, Burkmgair and others; the duke and his brother John were much in vogue. In 1518 and 1520 the sale of the best woodcuts and copper-plates were published. Great honour accrued to Cranach when he went in 1509 to the Netherlands, and took sitting from the emperor Maximilian and the boy who afterwards became Charles V. Till 1508 Cranach signed his works with the initials of his name. In that year the elector gave him the winged snake as a motto, and this motto or Kleinod, as it was called, superseded the initials on all his pictures after that date. Somewhat later the duke conferred on him the monopoly of the sale of medicines at Wittenberg, and a printer's patent with exclusive privileges as to copyright in Bibles. The presences of Cranach were used by Luther. His chemist's shop was open for centuries, and only perished by fire in 1871. Relations of friendship united the painter with the Reformers at a very early period; yet it is difficult to fix the time of his first acquaintance with Luther. The oldest notice of Cranach in the Reformer's correspondence dates from 1520. In a letter written from Worms in 1521, Luther calls him his gossip, warmly alluding to his "Gevatterin," the artist's wife. His first engraved portrait by Cranach was of his wife's mother, who died in 1520. Five years later the frow dropped the cowl, and Cranach was present as "one of the council" at the betrothal festival of Luther and Catherine Bora. The death at short intervals of the electors Frederick and John (1525 and 1532) brought no change in the prosperous situation of the painter; he remained a favourite with John Frederick I., under whose administration he twice (1537 and 1540) filled the office of burgomaster of Wittenberg. But 1547 witnessed a remarkable change in these relations. John Frederick was taken prisoner at the battle of Mühlberg, and Wittenberg was subjected to stress of siege. As Cranach wrote from his house at the corner of the market-place to the grand-master Albert of Brandenburg at Königsberg to tell him of John Frederick's capture, he showed his attachment by saying, "I cannot conceal from your Grace that we have been robbed of our dear prince, who from his youth upwards has been a true prince to us, but God will help him out of prison, for the Kaiser is bold enough to revive the Papacy, which God will certainly not allow; and as soon as the siege Charles bethought himself of Cranach, whom he remembered from his childhood and summoned to his camp at Piatritz. Cranach came, reminded his majesty of his early sailings as a boy, and begged on his knees for kind treatment to the elector. Three years afterwards, when all the dignitaries of the Empire met at Augsburg to receive commands from the emperor, and when Titian at Charles' bidding came to take the likeness of Philip of Spain, John Frederick asked Cranach to visit the Swabian capital; and here for a few months he was numbered amongst the household of the captive elector, whom he afterwards accompanied home in 1552. He died on the 16th of October 1553 at Weimar, where the house in which he lived still stands in the market-place.

The oldest extant picture of Cranach, the "Rest of the Virgin
CRANBERRY

365

during the Flight into Egypt," marked with the initials L.C., and the date of 1504, is by far the most graceful creation of his pencil. The scene is laid on the margin of a forest of pines, and discloses the habits of a painter familiar with the mountain scenery of Thuringia. There is more of gloom in landscapes of a later time; and this would point to a defect in the taste of Cranach, whose stag hunts are otherwise not unpleasing. Cranach's art in its prime was doubtless influenced by causes which but slightly affected the art of the Italians, but weighed with potent consequence on that of the Netherlands and Germany. The business of booksellers who sold woodcuts and engravings at fairs and markets in Germany naturally satisfied a craving which arose out of the paucity of wall-paintings in churches and secular edifices. Drawing for woodcuts and engraving of copper-plates became the occupation of artists of note, and the talents devoted in Italy to productions of the brush were here monopolized for designs on wood or on copper. We have thus to account for the comparative unproductiveness as painters of Dürrer and Holbein, and at the same time to explain the shallowness apparent in many of the later works of Cranach; but we attribute to the same cause also the tendency in Cranach to neglect effective composition and to confine himself to contrasts of flesh tint. Constant attention to mere contour and to black and white appears to have affected his sight, and caused those curious transitions of pallid light into inky grey which often characterize his studies of flesh; whilst the mere outlining of form in black became a natural substitute for modelling and chiaroscuro. There are, no doubt, some few pictures by Cranach in which the flesh-tints display brightness and enamelled surface, but they are quite exceptional. As a composer Cranach was not greatly gifted. His ideal of the human shape was low; but he showed some freshness in the delineation of incident, though he not unfrequently bordered on coarseness. His copper-plates and woodcuts are certainly the best outcome of his art; and the earlier they are in date the more conspicuous is their power. Striking evidence of this is the "St Christopher" of 1506, or the plate of "Elector Frederick praying before the Madonna" (1509). It is curious to watch the changes which mark the development of his instincts as an artist during the struggles of the Reformation. At first we find him painting Madonnas. His first woodcut (1509) represents the Virgin and three saints in prayer before a crucifix. Later on he composes the marriage of St Catherine, a series of martyrdoms, and scenes from the Passion. After 1517 he illustrates occasionally the old gospel themes, but he also gives expression to some of the thoughts of the Reformers. In a picture of 1518 at Leipzig, where a dying man offers "his soul to God, his body to earth, and his worldly goods to his relations," the soul rises to meet the Trinity in heaven, and salvation is clearly shown to depend on faith and not on good works. Again sin and grace become a familiar subject of pictorial delineation. Adam is observed sitting between John the Baptist and a prophet at the foot of a tree. To the left God produces the tables of the law, Adam and Eve partake of the forbidden fruit, the brazen serpent is reared aloft, and punishment supervenes in the shape of death and the realm of Satan. To the right, the Conception, Crucifixion and Resurrection symbolize redemption, and this is further improved on Adam by John the Baptist, who points to the sacrifice of the crucified Saviour. There are two examples of this composition in the galleries of Gotha and Prague, both of them dated 1549. One of the latest pictures with which the name of Cranach is connected is the altar-piece which Cranach's son completed in 1555, and which is now in the Stadtkirche (city church) at Weimar. It represents Christ in two forms, to the left trampling on Death and Satan, to the right crucified, with blood flowing from the lance wound. John the Baptist points to the suffering Christ, whilst the blood-stream falls on the head of Cranach, and Luther reads from his book the words, "The blood of Christ cleanseth from all sin." Cranach sometimes composed gospel subjects with feeling and dignity. "The Woman taken in Adultery" at Munich is a favourable specimen of his skill, and various repetitions of Christ receiving little children show the kindliness of his disposition. But he was not exclusively a religious painter. He was equally successful, and often comically naive, in mythological scenes, as when Cupid, who has stolen a honeycomb, complains to Venus that he has been stung by a bee (Weimar, 1530; Berlin, 1534), or where Hercules sits at the spinning-wheel mocked by Omphale and her maids. Harmou and pathos are combined at times with strong effect in pictures such as the "Jealousy" (Augsburg, 1527; Vienna, 1530), where women and children are huddled into telling groups as they watch the strife of men wildly fighting around them. Very realistic must have been a lost canvas of 1545, in which hares were catching and roasting sportsmen. In 1546, possibly under Italian influence, Cranach composed the "Fons Juventutis" of the Berlin Gallery, executed by his son, a picture in which hags are seen entering a Renaissance fountain, and are received as they issue from it with all the charms of youth by knights and pages.

Cranach's chief occupation was that of portrait-painting, and we are indebted to him chiefly for the preservation of the features of all the German Reformers and their princely adherents. But he sometimes condescended to depict such noted followers of the papacy as Albert, elector of Brandenburg, archbishop elector of Mainz, Anthony Cranvello and the duke of Alva. A dozen likenesses of Frederick III. and his brother John are found to bear the date of 1553. It is characteristic of Cranach's readiness, and a proof that he possessed ample material for mechanical reproduction, that he received payment at Wittenberg in 1553, for "sixty pairs of portraits of the elector and his brother" in one day. Amongst existing likenesses we should notice as the best that of Albert, elector of Mainz, in the Berlin museum, and that of John, elector of Saxony, at Dresden.

Cranach had three sons, all artists:—John Lucas, who died at Bologna in 1536; Hans Cranach, whose life is obscure; and Lucas, born in 1515, who died in 1586.

See Heller, Leben und Werke Lukas Cranachs (and ed., Bamberg, 1844); Chr. Schneidler, Lukas Cranachs des älteren Werke (3 vols., Leipzig, 1851-1871); Wurmecke, Cranach der ältere (Görlitz, 1879); M. B. Lindau, Lucas Cranach (1883); Lippmann, Lukas Cranach, Sammlung, &c. (Berlin, 1895), reproductions of his most notable woodcuts and engravings; Woermann, Verzeichnis der Dresdener Cranach-Ausstellung von 1899 (Dresden, 1899); Flechsig, Tafelbilder Cranachs des älteren und seiner Werkstatt (Leipzig, 1900); Muth, Lukas Cranach (Berlin, 1902); Michaelson, L. Cranach der Jüngere (1898); Cranz, iSgg. 1899; and many other works.

CRANBERRY, the fruit of plants of the genus Oxycoccus, (natural order Vacciniaceae), often considered part of the genus Vaccinium. O. palustris (or Vaccinium Oxycoccus), the common cranberry plant, is found in marshy land in northern and central Europe and North America. Its stems are wiry, creeping and of varying length; the leaves are evergreen, dark and shining above, glaucous below, revolute at the margin, ovate, lanceolate or elliptical in shape, and not more than half an inch long; the flowers, which appear in May or June, are small and stalked, and have a four-lobed, rose-tinted corolla, purplish filaments, and anther-cells forming two long tubes. The berries ripen in August and September; they are pear-shaped and about the size of currants, are crimson in colour and often spotted, and have an acid and astringent taste. The American species, O. macrocarpus, is found wild from Maine to the Carolinas. It attains growths of more than O. palustris and bears bigger and finer berries, which are of three principal sorts, the char, which is almost oblong, and the pear or bell-shaped, and vary in hue from light pink to dark purple, or may be mottled red and white. O. erythrococarpus is a species indigenous in the mountains from Virginia to Georgia, and is remarkable for the excellent flavour of its berry.

Air and moisture are the chief requisites for the thriving of the cranberry plant. It is cultivated in America on a soil of peat or vegetable mould, free from loam and clay, and cleared of turf, and having a surface layer of clean sand. The sand, which needs renewal every two or three years, is necessary for the vigorous existence of the plants, and serves both to keep the underlying soil cool and damp, and to check the growth of grass and weeds. The ground must be thoroughly drained, and should be provided with a supply of water and a dam for flooding the plants during
winter to protect them from frost, and occasionally at other seasons to destroy insect pests; but the use of spring water should be avoided. The flavour of the fruit is found to be improved by growing the plants in a soil enriched with well-rotted dung, and by supplying them with less moisture than they obtain in their natural habitats. Propagation is effected by means of cuttings, of which the wood should be wavy in texture, and the leaves of a greenish-brown colour. In America, where, in the vicinity of Cape Cod, Massachusetts, the cultivation of the cranberry commenced early in the last century, wide tracts of waste land have been utilized for that purpose—low, easily flooded, marshy ground, worth originally not more than from $10 to $20 an acre, having been made to yield annually $200 or $300 worth of the fruit per acre. The yield varies between 50 and 400 bushels an acre, but 100 bushels, or about 35 barrels, is estimated to be the average production when the plants have begun to bear well. The approximate cranberry crop of the United States from 1890 to 1899 varied from 410,000 to 1,000,000 bushels.

Cranberries should be gathered when ripe and dry, otherwise they do not keep well. The darkest-coloured berries are those which are most esteemed. The picking of the fruit begins in New Jersey in October, at the close of the blackberry and whortleberry season, and often lasts until the coming in of cold weather. From 3 to 4 bushels a day may be collected by good workers. New York, Philadelphia, Boston and Baltimore are the leading American markets for cranberries, whence they are exported to the West Indies, England and France in great quantities. England was formerly supplied by Lincolnshire and Norfolk with abundance of the common cranberry, which it now largely imports from Sweden and Russia. The fruit is much used for pies and tarts, and also for making an acid summer beverage. The cowberry, or red whortleberry, Vaccinium Vitis-Idaea, is sometimes sold for the cranberry. The Tasmanian and the Australian cranberries are the produce respectively of Astroloma humifusum and Lissasines suda, plants of the order Ericaceae. For literature of the subject see Ihe Proceedings of the American Cranberry Growers' Association (Trenton, N. J.). There is a good article on the American cranberry in L. H. Bailey's Cyclopedia of American Horticulture (1900).

CRANBROOK, GATHORNE GATHORNE-HARDY, 1st Earl of (1814-1906), British statesman, was born at Bradford on the 1st of October 1814, the son of John Hardy, and belonged to a Yorkshire family. Entering upon active political life in 1847, eleven years after his graduation at Oxford, and nine years after his call to the bar, he offered himself as a candidate for Bradford, but was unsuccessful. In 1856 he was returned for Leominster, and in 1865 he was returned for Bradford upon the Ouse. In 1866 he became president of the Poor Law Board in Lord Derby's new administration. When in 1867 Mr Walpole resigned, from dissatisfaction with Mr Disraeli's Reform Bill, Mr Hardy succeeded him at the home office. In 1874 he was secretary for war; and when in 1878 Lord Salisbury took the foreign office upon the resignation of Lord Derby, Viscount Cranbrook (as Mr Hardy became within a month afterwards) succeeded him at the India office. At the same time he had assumed the additional family surname of Gathorne, which had been that of his mother. In Lord Salisbury's administrations of 1885 and 1886 Lord Cranbrook was president of the council, and upon his retirement from public life concurrently with the resignation of the cabinet in 1892 he was raised to an earldom. He died on the 30th of October 1906, being succeeded as 2nd Earl by his son John Stewart Gathorne-Hardy, previously known as Lord Medway (b. 1859), who from 1869 to 1880 sat in parliament as a conserva
tive for Rye, and from 1884 to 1892 for a division.

See Gathorne Hardy, 1st Earl of Cranbrook, a memoir with extracts from his correspondence, edited by the Hon. E. Gathorne-Hardy (1910).

CRANBROOK, a market-town in the southern parliamentary division of Kent, England, 45 m. S.E. of London on a branch of the South-Eastern & Chatham railway from Paddock Wood. Pop. (1901) 3949. It lies on the Cranbrook, a feeder of the river Beult, in a pleasant district, hilly and well wooded. It has a fine church (mainly Perpendicular) dedicated to St Dunstan, which is remarkable for a baptistery, built in the early part of the 13th century, and some ancient stained glass. As the centre of the agricultural district of the Kentish Weald, it carries on an extensive trade in malt, hops and general goods; but its present condition is in striking contrast to the activity it displayed from the 14th to the 17th century, when it was one of the principal seats of the broadcloth manufacture. Remains of some of the old factories still exist. The town has a grammar school of Elizabethan foundation, which now ranks as one of the smaller public schools. In the neighbourhood are the ruins of the old mansion house of Sissinghurst, or Saxonhurst, built in the time of Edward VI.

CRANDALL, PRUDENCE (1803-1886), American school-teacher, was born, of Quaker parentage, at Hopkinton, Rhode Island, on the 3rd of September 1803. She was educated in the Friends' school at Providence, R. I., taught school at Plainfield, Conn., and in 1831 established a private academy for girls at Canterbury, Windham county, Connecticut. By admitting a negro girl she lost her white patrons, and in March 1833, on the advice of William Lloyd Garrison and Samuel J. May (1797–1863), she opened a school for negro children, "to which little money and little mention of colour." For this she was bitterly denounced, not only in Canterbury but throughout Connecticut, and was persecuted, boycotted and socially ostracized; measures were taken in the Canterbury town-meeting to break up the school, and finally in May 1833 the state legislature passed the notorious Connecticut "Black Law," prohibiting the establishment of schools for non-resident negroes in any city or township of Connecticut, without the consent of the local authorities. Miss Crandall, refusing to submit, was arrested, tried and convicted in the lower courts, whose verdict, however, was reversed on a technicality by the court of appeals in July 1834. Thereupon the local opposition to her redoubled, and she was finally in September 1834 forced to close her school. Soon afterward she married the Rev. Calvin Phillee. She died at Elk Falls, Kansas, on the 28th of January 1886. The Connecticut Black Law was repealed in 1838. Miss Crandall's attempt to educate negro girls at Canterbury attracted the attention of the whole country; and the episode is of considerable significance as showing the attitude of a New England community toward the negro at that time.

See J. C. Kimball's Connecticut Canterbury Tale (Hartford, Conn., 1889), and Samuel J. May's Recollections of Our Anti-Slavery Conflict (Boston, 1869).

CRANE, STEPHEN (1879-1900), American writer, was born at Newark, New Jersey, on the 1st of November 1879, and was educated at Lafayette College and Syracuse University. His first story, Maggie, a Girl of the Streets, was published in 1892, but its great success was made with The Red Badge of Courage (1896), a brilliant and highly realistic, though of course imaginative, description of the experiences of a private in the Civil War. He was also the author of various other stories, and acted as a war correspondent in the Greco-Turkish War (1897) and the Spanish American War (1898). His health became seriously affected in Cuba, and on his return he settled down in England. He died at Badenweiler, Germany, on the 5th of June 1900.

CRANE, WALTER (1845- ), English artist, second son of Thomas Crane, portrait painter and miniaturist, was born in London on the 15th of August 1845. The family soon removed to Torquay, where the boy gained his early artistic impressions, and, when he was twelve years old, to London. He early came under the influence of the Pre-Raphaelites, and was a diligent student of Ruskin. A set of coloured page designs to illustrate Tennyson's "Lady of Shalott" gained the approval of William James Linton, the wood-engraver, to whom Walter Crane was apprenticed for three years (1859-1862). As a wood-engraver he had abundant opportunity for the minute study of the contemporary artists whose work passed through his hands, of Rossetti, Millais, Tenniel and F. Sandy, and of the masters of the Italian Renaissance, but he was more influenced by the Elgin marbles in the British Museum. A further and important element in the development of his talent, was the study of
Japanese colour-prints, the methods of which he imitated in a series of toy-books, which started a new fashion. In 1862 a picture of his, “The Lady of Shalott,” was exhibited at the Royal Academy, but the Academy steadily refused his mature work; and after the opening of the Grosvenor Gallery in 1877 he ceased to send pictures to Burlington House. In 1884 he began to illustrate for Mr Edmund Evans, the colour printer, a series of sixpenny toy-books of nursery rhymes, displaying admirable fancy and beauty of design, though he was limited to the use of three colours. He was allowed more freedom in a delightful series begun in 1873, The Frog Prince, &c., which showed markedly the influence of Japanese art, and of a long visit to Italy following on his marriage in 1871. The Baby’s Opera was a book of English nursery songs planned in 1877 with Mr Evans, and a third series of children’s books with the collective title, A Romance of the Three R’s, provided a regular course of instruction in art for the nursery. In his early “Lady of Shalott” the artist had shown his preoccupation with unity of design in book illustration by printing in the words of the poem himself, in the view that this union of the calligrapher’s and the decorator’s art was one secret of the beauty of the old illuminated books. He followed this with work in an English version of The First of May: A Fairy Masque by his friend John R. Wise, text and decoration being in this case reproduced by photogravure. The “Goose Girl” illustration taken from his beautiful Household Stories from Grimm (1882) was reproduced in tapestry by William Morris, and is now in the South Kensington Museum. Flora’s Feast, A Masque of Flowers had lithographic reproductions of Mr Crane’s line drawings washed in with water colour; he also decorated in colour The Wonder Book of Nathaniel Hawthorne, and Margaret Deland’s Old Garden; in 1894 he collaborated with William Morris in the page decoration of The Story of the Glittering Plain, published at the Kelmscott press, which was executed in the style of 16th-century Italian and German woodcuts; but in purely decorative interest the finest of his works in book illustration is Spenser’s Faerie Queene (12 pts., 1894-1896) and the Shepherd’s Calendar. The poems which form the text of Queen Summer (1891), Renascence (1891), and The Sirens Three (1896) are by the artist himself.

In the early ‘eighties under Morris’s influence he was closely associated with the Socialist movement. He did as much as Morris himself to bring art into the daily life of all classes. With this object in view he devoted much attention to designs for textile stuffs, for wall-papers, and to house decoration; but he also used his art for the direct advancement of the Socialist cause. For a long time he provided the weekly cartoons for the Socialist organs, Justice and The Commonweal. Many of these were collected as Cartoons for the Cause. He devoted much time and energy to the work of the Art Workers’ Guild, and to the Arts and Crafts Exhibition Society, founded by him in 1888. His own easel pictures, chiefly allegorical in subject, among them “The Bridge of Life” (1884) and “The Mower” (1891), were exhibited regularly at the Grosvenor Gallery and later at the New Gallery. “Neptune’s Horses,” which, with many other of Mr Crane’s pictures, came into the possession of Herr Ernst Seeger of Berlin, was exhibited at the New Gallery in 1893, and with it were included “The Wolf” (1891) and a study of “The Winter”.

His varied work includes examples of plaster relief, tiles, stained glass, pottery, wall-paper and textile designs, in all of which he applied the principle that in purely decorative design “the artist works freest and best without direct reference to nature, and should have learned the forms he makes use of by heart.” An exhibition of his work of different kinds was held at the Fine Art Society’s galleries in Bond Street in 1891, and taken over to the United States in the same year by the artist himself. It was afterwards exhibited in the chief German, Austrian and Scandinavian towns, arousing great interest throughout the continent.

Mr Crane became an associate of the Water Colour Society in 1888; he was an examiner of the science and art department at South Kensington; director of design at the Manchester Municipal school (1894); art director of Reading College (1896); and in 1898 for a short time principal of the Royal College of Art. His lectures at Manchester were published with illustrated drawings as The Box of Design (1898) and Line and Form (1900). The Decorative Illustration of Books, Old and New (2nd ed., London and New York, 1900) is a further contribution to theory. A well-known portrait of Mr Crane by G. F. Watts, R.A., was exhibited at the New Gallery in 1893. There is a comprehensive and sumptuously illustrated book on The Art of Walter Crane, by F. G. Konody; a monograph (1902) by Otto von Schleinitz in the Kaiser’s Monographien series (Bielefeld and Leipzig); and an account of himself by the artist at the Easter number of 1898 of the Art Journal.

CRANE, WILLIAM HENRY (1845–1896), American actor, was born on the 30th of April 1845, in Leicester, Massachusetts, and made his first appearance at Utica, New York, in Donizetti’s Daughter of the Regiment in 1863. Later he had a great success as Le Blanc the Notary, in the burlesque Evangeline (1873). He made his first hit in the legitimate drama with Stuart Robson (1836–1903), in The Comedy of Errors and other Shakespearian plays, and in The Henrietta (1881) by Bronson Howard (1842–1908). This partnership lasted for twelve years, and subsequently Crane appeared in various eccentric character parts in America.

In 1904 he turned to more serious work and played Isidore Izard in Business is Business, an adaptation from Octave Mirbeau’s Les Affaires sont les affaires.

CRANE (in Dutch, Kraan; O. Ger. Kraan; cognate, as also the Lat. grus, and consequently the Fr. grue and Span. grulla, with the Gr. γραφός), the Grus communis or G. cinerea of ornithologists, one of the largest wading-birds, and formerly a native of England, where William Turner, in 1544, said that he had very often seen its young ("carum pipionis sacpsissime vivi"). Notwithstanding the protection afforded it by sundry acts of parliament, it has long since ceased from breeding in England. Sir T. Browne (ob. 1682) speaks of it as being found in the open parts of Norfolk in winter. In Ray’s time it was only known as occurring at the same season in large flocks in the fens of Lincolnshire and Cambridgeshire; and though mention is made of cranes’ eggs and young in the fen-laws passed at a court held at Revesby in 1760, this was most likely but the formal repetition of an older edict; for in 1768 Pennant wrote that after the strictest inquiry he found the inhabitants of those counties be wholly unacquainted with the bird. The crane, however, no doubt then appeared in Britain, as it does now, at uncertain intervals and in unwonted places, having strayed from the migrating bands whose movements have been remarked from almost the earliest ages. Indeed, the crane’s aerial journeys are of a very extended kind; and on its way from beyond the borders of the Tropic of Cancer to within the Arctic Circle, or on the return voyage, its flocks may be descried passing overhead at a marvellous height, or halting for rest and refreshment on the wide meadows that border some great river, while the seeming order with which its ranks are marshalled during flight has long attracted attention. The crane takes up its winter quarters under the burning sun of Central Africa and India, but early in spring returns northward. Not a few examples reach the chill polar soils of Lapland and Siberia, but some tarry in the south of Europe and breed in Spain, and, it is supposed, in Turkey. The greater number, however, occupy the intermediate zone and pass the summer in Russia, north Germany, and Scandinavia. Soon after their arrival in these countries the flocks break up into pairs, whose nuptial ceremonies are accompanied by loud and frequent trumpetings, and the respective breeding-places of each are chosen.

The nest is formed with little art on the ground in large open marshes, where the herbage is not very high—a tolerably dry spot being selected and used apparently year after year. Here the eggs, which are of a rich brown colour with dark spots, and always two in number, are laid. The young are able to run soon after they are hatched, and are at first clothed with tawny down. In the course of the summer they assume nearly the same grey plumage that their parents wear, except that the elongated plumes, which in the adults form a graceful covering of the hinder
CRANES

parts of the body, are comparatively undeveloped, and the clear black, white and red (the last being due to a patch of papillosse skin of that colour) of the head and neck are as yet indistinct. During this time they keep in the marshes, but as autumn approaches the different families unite by the rivers and lakes, and ultimately form the enormous bands which after much more trumpeting set out on their southward journey.

The crane's power of uttering its sonorous and peculiar trumpet-like notes is commonly ascribed to the formation of its trachea, which, on quitting the lower end of the neck passes backward between the branches of the furcula and is received into a hollow space formed by the bone walls of the carina or keel of the sternum. Herein it makes three turns, and then runs upwards and backwards to the lungs. The apparatus on the whole much resembles that found in the whooping swans (Cygnus mucicara, C. baculicollis, and others), though differing in some not unimportant details; but at the same time somewhat similar convolutions of the trachea occur in other birds which do not possess, so far as is known, the faculty of trumpeting. The crane emits its notes both during flight and while on the ground. In the latter case the neck and bill are uplifted and the mouth kept open during the utterance of the blast, which may be often heard from birds in confinement, especially at the beginning of the year.

As usually happens in similar cases, the name of the once familiar British species is now used in a general sense, and applied to all others which are allied to it. Though by former systematists placed near or even among the herons, there is no doubt that the cranes have only a superficial resemblance and no real affinity to the Ardeidae. In fact the Gruidae form a somewhat isolated group. Huxley included them together with the Rallidae in his Ornithomorphae; but a more extended view of their various characters would probably assign them rather as relatives of the Bustards—not that it must be thought that the two families have not been for a very long time distinct. Grus, indeed, is a very ancient form, its remains appearing in the Miocene of France and Greece, as well as in the Pliocene and Post-pliocene of North America. In France, too, during the “Reindeer Period” there existed a huge species—the G. primigenia of Alphonse Milne-Edwards—which has doubtless been long extinct. At the present time cranes inhabit all the great zoogeographical regions of the earth, except the Neotropical, and some sixteen or seventeen species are discriminated. In Europe, besides the G. communis already mentioned, the Numidian or demoiselle-crane (G. virgo) is distinguished from every other by its long white ear-tufts. This bird is also widely distributed throughout Asia and Africa, and is said to be the crane which is so often mentioned in the Bible. The eastern part of the Palaearctic Region is inhabited by four other species that do not frequent Europe (G. antigone, G. japonensis, G. monachus, and G. leucogeranus), of which the last is perhaps the finest of the family, with nearly the whole plumage of a snowy white. The Indian Region, besides being visited in winter by four of the species already named, has two that are peculiar to it (G. torquata and G. indica, both commonly confounded under the name of G. antigone). The Australian Region possesses a large species known to the colonists as the "native companion" (G. australis), while the Nearctic is tenanted by three species (G. americana, G. canadensis and G. fraterculus), to say nothing of the possibility of a fourth (G. schlegeli), a little-known and somewhat obscure bird, finding its habitat here. In the Ethiopian Region there are two species (G. paradisiaca and G. carunculata), which do not occur out of Africa, as well as three others forming the group known as "crooked cranes"—differing much from other members of the family, and justifiably placed in a separate genus, Balearica. One of these (B. pavonina) inhabits northern and western Africa, while another (B. regulorum) is confined to the eastern and southern parts of that continent. The third (B. ceciliae), from the White Nile, has been described by Dr P. Chalmers Mitchell (P.Z.S., 1904).

With regard to the literature of this species, a paper "On the Breeding of the Crane in Lapland" (Ibis, 1890, p. 101), by John Wolley, is one of the most pleasing contributions to natural history ever written, and an admirably succinct account of all the different species was communicated by Blyth to The Field in 1873 (vol. xii. p. 631. vol. xii. pp. 7, 61, 136, 189, 248, 384, 408, 418). A beautiful picture representing a flock of cranes resting by the Rhine during one of their annual migrations is to be found in Wolf's Zoological Sketches.

(A. N.)

CRANES (so called from the resemblance to the long neck of the bird, cf. Gr. γαράντος, Fr. grue), machines by means of which heavy bodies may be lifted, and also displaced horizontally, within certain defined limits. Strictly speaking, the name alludes to the arm or jib from which the load to be moved is suspended, but it is now used in a wider sense to include the whole mechanism by which a load is raised vertically and moved horizontally. Machines used for lifting only are not called cranes, but winches, lifts or hoists, while the term elevator or conveyer is commonly given to appliances which, continuously, not in separate loads, move materials like grain or coal in a vertical, horizontal or diagonal direction (see CONVEYORS). The use of cranes is of great antiquity, but it is only since the great industrial development of the 19th century, and the introduction of other motive powers than hand labour, that the crane has acquired the important and indispensable position it now occupies. In all places where finished goods are handled, or manufactured goods are made, cranes of various forms are in universal use.

Cranes may be divided into two main classes—revolving and non-revolving. In the first the load can be lifted vertically, and then moved round a central pivot, so as to be deposited at any convenient point within the range. The type of this class is the ordinary jib crane. In the second class there are, in addition to the lifting motion, two horizontal movements at right angles to one another. The type of this class is the overhead traveller. The two classes obviously represent respectively systems of polar and rectangular co-ordinates. Jib cranes can be subdivided into fixed cranes and portable cranes; in the former the central post or pivot is firmly fixed in a permanent position, while in the latter the whole crane is mounted on wheels, so that it may be transported from place to place.

The different kinds of motive power used to actuate cranes—manual, steam, hydraulic, electric—give a further classification. Hand cranes are extremely useful where the load is not excessive, and the quantities to be dealt with are not great; also where speed is not important, and first cost is an essential consideration. The net effective work of lifting that can be performed by a man turning a handle may be taken, for intermittent work, as being on an average about 5000 foot-logs per minute; this is equivalent to a ton lifted about 2½ ft. per minute, so that four men can by a crane raise a ton 9 ft. in a minute or 9 tons 1 ft. per minute. It is at once evident that hand power is only suitable for cranes of moderate power, or in cases where heavy loads have to be lifted only very occasionally. This point is dwelt upon, because the speed limitations of the hand-crane are often overlooked by engineers. Steam is an extremely useful motive power for all cranes that are not worked off a central power station. The steam crane has the immense advantage of being completely self-contained. It can be moved (by its own locomotive power, if desired) long distances without requiring any complicated means of conveying power to it; and it is rapid in work, fairly economical, and can be adapted to the most varying circumstances. Where, however, there are a number of cranes all belonging to the same installation, and these are placed so as to be conveniently worked from a central power station, and where the work is rapid, heavy and continuous, as is the case at large ports, docks and railway or other warehouses, experience has shown that it is best to produce the power in a generating station and distribute it to the cranes. Down to the closing decades of the 19th century hydraulic power was practically the only system available for working cranes from a power station. The hydraulic crane is rapid in action, very smooth and silent in working, easy to handle, and not excessive in cost or upkeep,—advantages which have secured its adoption in every part of the world. Electricity as a motive power for cranes is of more recent introduction. The electric
transmission of energy can be performed with an efficiency not reached by any other method, and the electric motor readily adapts itself to cranes. When they are worked from a power station the great advantage is gained that the same plant which drives them can be used for many other purposes, such as working machine tools and supplying current for lighting. For dock-side jib cranes the use of electric power is making rapid strides. For overhead travellers in workshops, and for most of the cranes which fall into our second class, electricity as a motive power has already displaced nearly every other method. Cranes driven by shifting, or by mechanical power, have been largely superseded by electric cranes, principally on account of the much greater economy of transmission. For many years the best workshop travellers were those driven by quick running ropes; these performed admirable service, but they have given place to the more modern electric traveller.

The principal motion in a crane is naturally the hoisting or lifting motion. This is effected by swinging the load to an eye or hook, and elevating the hook vertically. There are two typical methods: (1) A direct pull may be applied to the hook, either by screws, or by a cylinder fitted with piston and rod and actuated by direct hydraulic or other pressure, as shown diagrammatically in fig. 1. These methods are used in exceptional cases, but present the obvious difficulty of giving a very short range of lift. (2) The hook may be attached to a rope or chain, and the pulling cylinder connected with a system of pulleys around which the rope is led; by these means the lift can be very largely increased. Various arrangements are adopted; the one indicated in fig. 2 gives a lift of load four times the stroke of the cylinder. This second method forms the basis of the lifting gear in all hydraulic cranes. (3) The lifting rope or chain is led over pulley to a lifting barrel, upon which it is coiled as the barrel is rotated by the source of power (fig. 3). Several cranes are particularly well adapted to this method of lifting. For very heavy loads, the chain is a special pitch chain, formed of flat links pinned together, and the barrel is reduced to a wheel provided with teeth, or "sprockets," which engage in the links. In this case the chain is coiled, but simply passes over the lifting wheel, the free end hanging loose. All the methods in this third category require a rotating lifting barrel or shaft, and this is the important difference between them and the hydraulic cranes mentioned above. Cranes fitted with rotating hydraulic engines may be considered as coming under the third category.

When the loads are heavy the above mechanisms are supplemented by systems of purchase blocks suspended from the jib or the traveller crab; in crane vehicles of large capacity trains of rotating gear and interposed between the motor, or manual handle, and the barrel (fig. 3). When a load is lifted, work has to be done in overcoming the inertia of gravity and the friction of the mechanism: when it is lowered, energy is given out. To control the speed and absorb this energy, brakes have to be provided. The hydraulic crane has a great advantage in possessing an almost ideal brake, a "spilled drum" being acted upon by the oil passing through it, the speed of descent being regulated within very wide limits and with perfect safety. Barrel cranes are usually fitted with band brakes, consisting of a brake rim with a friction band placed round it, the band being tightened as required. In ordinary cases conduction and convection suffice to dissipate the heat generated by the brake, but when a great deal of lowering has to be rapidly performed, or heavy loads have to be lowered to a great depth, special arrangements have to be provided. An excellent brake for very large cranes is Matthew's hydraulic brake, in which water is passed from end to end of cylinders fitted with reciprocating pistons, cooling jackets being provided. In electric cranes a useful method is to arrange the connections so that the lifting motor acts as a dynamic, and, driven by the energy of the falling load, generates a current which is converted into heat by being passed through resistances. That the quantity of heat to be got rid of may become very considerable is seen when it is considered that the energy of a load of 60 tons descending through 50 ft. is equivalent to an amount of heat sufficient to raise nearly 6 gallons of water from 60° F. to boiling point. Crane brakes are usually under the direct control of the driver, and they are generally arranged in one of two ways. In the first, the pressure is applied to a band hand, or by springs. In the second, or "braking off" method, the brake is automatically applied by a spring or weight, and is released either mechanically or, in the case of electric cranes, by the pull of the motor, or by cutting off the current passing through the motor. When the motor starts the brake is released; when it stops, or the current ceases, the brake goes on. The first method is in general use for steam cranes; it gives a fair range of power in the brake, but is not automatic, as is the second.

In live-barrel cranes the lifting barrel is connected to the revolving shaft by a powerful friction clutch; this, when interlocked with the power drum of the crane, gives the engine a direct mechanical advantage, and makes the lifting motion very rapid. In working, as the barrel can be detached and lowering performed at a very high speed, without waiting for the lifting motor to come to rest in order to be reversed. This method of working is very satisfactory for electric cranes, and in certain cases for steam cranes. When the barrel is driven by a cylinder, the friction clutch is usually mounted in a similar manner by spur gear or by worm gear. The toothed wheels give a slight better efficiency, but the worm gear is somewhat smoother in its action and entirely silent; the noise of gearing can, however, be considered an objection to the use of worm gear, as is always done, and also by the use of pinions made of rawhide leather or other non-resonant material. When quick metal pinions are used they are arranged to run in closed oil-haths. Loads, however, must be further protected, as the barrels and freewheeling worm gear wheel is of very high efficiency if made very thick in pitch, with properly formed teeth perfectly lubricated, and with the end thrust of the worm taken on ball bearings. Much attention is paid to the general mechanical details of the lifting and other motions of cranes, and in important installations the gearing is now usually made of cast steel. In revolving cranes ease of slowing can be greatly increased by the use of a live ring of cast steel, instead of cast iron.

Electric motors for barrel cranes are not essentially different from those used for other purposes, but in proportioning the sizes of the intermittent output has to be taken into consideration. This fact has led to the use of the "ratio of load" or "idler" factor, which is usually termed "load factor.

Power required.

This latter is the ratio of the length of the working periods to the whole time; e.g., a motor rated for a quarter hour load factor means that the motor is capable of exerting its full normal horse-power for three minutes in succession, or equivalent to one-twelve hour, and out of every four, the pause being three minutes. The actual load factor to be chosen depends on the nature of the work and the kind of crane.

A dock-side crane unloading cargo with high lifts following one another in rapid succession of require a high load factor than a workshop traveller with a very short lift and only a very occasional maximum load; and a traveller with a very long long distance journey will require a higher load factor for the travelling motion than the lifting load. In practice, the load factor for electric crane motors varies from ¾ to 1. In steam cranes much the same principle obtains in proportioning the boiler; e.g., the engines of a 10-ton steam crane have cylinders capable of indicating about 60 tons at one time, whereas in an intermittent engine, in consequence of the intermittent working, sufficient steam can be supplied with a boiler whose heating surface is only ¼ to ¼ of that necessary for the above power, when developed continuously by a steam engine of the same size.

In well-designed, quick-running cranes the mechanical efficiency of the lifting gear may be taken as about 85%: a good electric jib crane will give an efficiency of 75%, i.e., when actually lifting at full speed, one-third of the electrical energy is converted into the mechanical energy of the lifting motion. The heat energy is in consequence of the intermittent working, sufficient steam can be supplied with a boiler whose heating surface is ¼ to ¼ of that necessary for the above power, when developed continuously by a steam engine of the same size.

The motor in most common use for electric cranes is the series wound, continuous current motor, which has many advantages. It has a very large starting torque, which enables it to overcome the inertia of getting the load into motion, and it lifts heavy loads at a slower speed and lighter loads at a quicker one, behaving, under the action of the controller in a somewhat similar manner to that in which the cylinders of the steam crane respond to the action of the stop-valve. Three-phase motors are also much used for
CRANES

Crane-driving, and it is probable that improvements in single and two-phase motors will eventually largely increase their use for this class of work.

Tests of the comparative efficiencies of hydraulic and electric cranes show that, although they do not vary to any very considerable extent with full load, yet the efficiency of the hydraulic crane falls away very much more rapidly than that of the electric crane when working on smaller loads. This drawback can be counteracted to a very great extent by furnishing the hydraulic crane with more than one cylinder, and thus compelling it, but the arrangement does not give the same economical range of load as an electric crane. In first cost the hydraulic crane has the advantage, but the power mains are much less expensive and more convenient to arrange in the electric crane.

The limit of speed of lift of hand cranes has already been mentioned; for steam jib cranes average practice is represented by the formula

\[ V = \frac{300 + 200T}{T} \]

where \( V \) is the speed of lift in feet per minute and \( T \) the load in tons. Where electric or hydraulic cranes are worked from a central station the speed is greater, and may be roughly represented by \( V = \frac{500 + 300T}{T} \); e.g. a 30-cwt. crane would lift with a speed of about 200 ft. per minute, and a 1-ton crane with a speed of about 8 ft. per minute, but these speeds vary with local circumstances.

The lifting speed of electric travelling cranes is generally less, because the lift is generally much shorter, and may in ordinary cases be taken as \( V = \frac{30 + 85T}{T} \). The cross-travelling speed of travelling cranes varies from 60 to 120 ft. per minute, and the longitudinal from 100 to 300 ft. per minute. The speed of these two motions depends much on the length of the span and of the longitudinal run, and on the nature of the work to be done; in certain cases, e.g. foundries, it is desirable to be able to lift, to certain occasions, at an extremely slow speed. In addition to the brakes on the lifting gear of cranes it is found necessary, especially in quick-running electric cranes, to provide a brake on the subsidiary motions, and also devices to stop the motor at the end of the lift or travel, so as to prevent over-running.

There are many other important points of crane construction too numerous to mention here, but it may be said generally that the advent of electricity has tended to increase speeds, and in consequence great attention is paid to all details that reduce friction and wear, such as roller and ball bearings and improved methods of lubrication; and, as in all other quick-running machinery, great stress has to be laid on accuracy of workmanship. The machinery, thus being of higher class, requires more protection, and what work that in the open are now fitted with elaborate crane-houses or cabins, furnished with weather-tight doors and windows, and more care is taken to provide proper platforms, hand-rails and ladders of adequate size for the working of the crane. A crane in which the crane revolves. The revolving part is made with two side frames of cast iron or steel plates, and to these the lifting gear is attached.

Typical Forms of Cranes.—Fig. 4 is a diagram of a fixed hand revolving jib crane, of moderate size, as used in railway goods yards and similar places. It consists of a heavy base, which is securely bolted to the foundation, and which carries the cranes, crane-post, or pillar, to which the crane revolves. The revolving part is made with two side frames of cast iron or steel plates, and to these the lifting gear is attached. The load is suspended from the crane jib; this jib is attached at the lower end to the side frames, and the upper end is supported by tie-rods, connected to the framework, the whole revolving together. This simple form of crane thus embodies the essential elements of foundation, post, framework, jib, tie-rods and gearing.

Fig. 5 shows another type of fixed crane, known as a derrick crane. Here the crane-post is extended into a long mast and is furnished with pivots at the top and bottom; the mast is supported by two "back tills," and these are connected to the socket of the bottom pivot by a cross-piece; this is a very good and comparatively cheap form of crane, where a long and variable radius is required, but it cannot slew through a complete circle. Derrick cranes are made of all powers, from the timber 1-ton hand derrick to the steel 150-ton derrick used in shipbuilding yards. The derrick crane introduces a problem for which many solutions have been sought, that of preventing the load from being lifted or lowered when the jib is pivoted up or down to alter the radius. To keep the load level, there are various devices for automatically coupling the jib-raising and the load-lowering motions.

Somewhat allied to the derrick are the sheer legs (fig. 6). Here the place of the jib is taken by two inclined legs joined together at the top and pivoted at the bottom; a third back leg is connected at the top to the other two, and at the bottom is coupled to a nut which runs on a long horizontal screw. This horizontal movement of the lower end of the back leg allows the whole arrangement to assume the position shown in fig. 7, so that a load can be taken out of a vessel and deposited on a quay wall. The same effect can be produced by shortening the back leg by a screw placed in the direction of its length. Sheer legs are generally built in very large sizes, and their use is practically confined to marine work.

Another type of fixed crane is the "fairbairn" crane, shown in fig. 8. Here the jib, superstructure and post are all united in one piece, which revolves in a foundation well, being supported at the bottom by a toe-step and near the ground level by horizontal rollers. This type of crane used to be in great favour, in consequence of the great clearance it gives under the jib, but it is expensive and requires very heavy foundations.

The so-called "hammer-headed" crane (fig. 9) consists of a steel braced tower, on which revolves a large horizontal double cantilever; the forward part of this cantilever or jib carries the lifting crab, and the jib is extended backwards in order to form a support for the machinery and counter-balance. Besides the motions of lifting and revolving, there is provided a so-called "racking" motion, by which the lifting crane, with the load suspended, can be moved in and out along the jib without altering the level of the load. Such horizontal movement of the load is a marked feature of later crane design; it first became prominent in the so-called "Titan" cranes, mentioned below (fig. 14). Hammer-headed cranes are generally constructed in large sizes, up to 200 tons.

Another type of fixed revolving crane is the foundry or smithy crane (fig. 10). It has the horizontal racking motion mentioned above, and revolves either on upper and lower pivots supported by the structure of the workshop, or on a fixed pillar secured to a heavy foundation. The type is often used in foundries, or to serve heavy hammers in a smithy, whence the name.

Portable cranes are of many kinds. Obviously, nearly every kind of crane can be made portable by mounting it on a carriage, fitted with wheels; it is even not unusual to make the Scottish derrick portable by using three trucks, one under the mast, and the others under the two back legs.

Fig. 11 represents a portable steam jib crane; it contains the same elements as the fixed crane (fig. 4), but the foundation bed is mounted on a truck which is carried on railway or road wheels. With portable cranes means must be provided to ensure the requisite stability against overturning; this is done by weighting the tail of the revolving part with heavy weights, and in steam cranes the
CRANES

371

boiler is so placed as also to form part of the counterbalance. Where
the rail-gauge is narrow and great weight is not desired, blocking
girders are provided across the under side of the truck; these
are arranged so that, by means of wedges or screws, they can be made
to increase the base. In connexion with the stability of portable
cranes, it may be mentioned that accidents more often arise from

overturning backwards than forwards. In the latter case the over-
turning tendency begins as soon as the load leaves the ground, but
cases as soon as the load again touches the ground and thus relieves
the crane of the extra weight, whereas overturning backwards is
caused either by the reaction of a chain breaking or by excessive
counterweight. When portable cranes are fitted with springs and
axle-boxes, drawgear and buffers, so that they can be
coupled to an ordinary railway train, they are called "break-
down" or "wrecking" cranes.

Dock-side jib cranes for
working general cargo are
always made portable, in
order to enable them to be
placed in correct position in
regard to the hatchways of
the vessels which they serve.
Fig. 12 shows an ordinary
hydraulic dock-side jib crane.
This type is usually fitted with
a very high jib, so as to lift
goods in and out of high-sided
vessels. The hydraulic lifting
cylinders are placed inside
the revolving steel mast or post,
and the cabin for the driver is
arranged high up in the front
of the post, so as to give a good
view of the work. The pressure is conveyed to the crane by means of
jointed "walking" pipes, or flexible hose, connected to hydrants
placed at regular intervals along the quay or wharf. Where the face of the
warehouse is sufficiently close to the water to permit of the crane
operating the hatches without requiring a jib of ex-
cessive radius, it is a very
convenient plan to place the
whole crane on the warehouse
roof.

Fig. 11.

Fig. 12.

A special form of jib crane, designed to meet a particular
purpose, is the "Titan" (fig. 14) largely used in the construction of
piers and breakwaters. It contains all the essential elements of the
hammer-headed crane, of which it may be considered to be the parent;
in fact, the only essential difference is that the Titan is portable
and the hammer-head crane fixed. The Titan was the first type of large
portable crane in which full use was made of a truly horizontal
movement of the load; for the purpose for which the type is de-
signed, viz. setting concrete blocks in courses, this motion is almost
a necessity.

As types of non-revolving cranes, fig. 15 shows an overhead
traveller worked by hand, and fig. 16 a somewhat similar machine
worked by electric power. The principal component
parts of a traveller are the main cross girders forming the
bridge, the two end carriages on which the bridge rests, the
running wheels which enable the end carriages to travel
on the longitudinal gantry girders or trestways, and the crab or jenny,
which carries the hoisting mechanism, and moves across the span on

rails placed on the bridge girders. There are numerous and important
variations of these two types, but the above contain the elements
out of which most cranes of the class are built.

One variation is illustrated in fig. 17, and is called a "Goliath"
or "Wellington." It is practically a traveller mounted on high
legs, so as to permit of its being travelled on rails placed on the
ground level, instead of on an elevated gantry. Of other variations
and combinations of types, fig. 18 shows a modern design of
a crane intended to command the
maximum of yard space, and
having some of the character-
istics both of the Goliath and
of the revolving jib crane, and
fig. 19 depicts a combination of
a traveller and a hanging jib crane.

When the cross traverse
motion of a traveller crab is
suppressed, and the longitudinal
motion of a small jib is increased
in importance we come to a
type of crane, the use of which
is rapidly increasing; it goes by the name of "transporter.
Trans-
porters can only move the load to any point on a vertical
surface (generally a plane surface); they have a lifting
tion and a movement of translation. They are of two
kinds: (1) Those in which the motive power and lifting
gear are self-contained on the crane; and (2) those in which the motive
power is placed in a fixed position. A transporter of the first class is
shown in fig. 20. From the
lower flange of a suspended
runway, made of a single I
section, run wheels, from the
axles of which the trans-
porter is suspended. The
latter consists of a frame-
work carrying the hoisting
barrel, with its driving motor
and gearing, and a travelling
motor, which is geared to the
running wheels in such a
manner as to be able to
propel the whole machine;

a seat is provided for the
operators of the controllers. A transporter of this kind,
when fitted with a grab, is a very efficient machine for taking coal
from barges and depositing it in a coal store.

In the other class of transporter the load is not usually moved
CRANIOMETRY

It consists essentially of a jib made of single J-sections, and supported by tie-rods (fig. 21), the load to be lifted being suspended from a small travelling carriage which runs on the lower flange. The lifting gear is located in an convenient fixed position. In order that only one motor may be used, and also that the load may be lifted by a single part of rope, various devices have been devised. The jib is usually inclined, so as to enable the travel to be performed by gravity in one direction, and the object of the transporter mechanism is to ensure that the load reversed. The jib of transporters are often made to slide forward, or lift up, so as to be out of the way when not in use. Transporters are largely used for dealing with general cargoes between vessels and warehouses, and also for coaling vessels; they have a great advantage in not interfering with the rigging of vessels.

CRANIOMETRY. The application of precise methods of measurement marks a definite phase in the development of the most branches of modern science, and thus craniometry, a comprehensive expression for all methods of measuring the skull (cranium), provides a striking landmark in the progress of anthropological studies. The origin of craniometry appears to be twofold. Certain artists made measurements of heads and skulls with a view to attaining greater accuracy in their representation of those parts of the human frame. Bernard de Palissy and A. Dürer may be mentioned as pioneers in such researches. Again, it is clearly shown in the literature of this subject, that anatomists were led to employ methods of measurement in their study of the human skull. The determining cause of this improvement in method is curious, for it appeared at the end of a famous anatomical controversy of the later middle ages, namely the dispute as to whether the Galenic anatomy was based on the study of the human body or upon those of apes. In the description of the dissection of a chimpanzee (in 1680) Tyson explains that the measurements he made of the skull of that animal were devised with a view to exhibiting the difference between this and the human skull.

The anatomists did not carry their researches very far. The anatomists on the contrary continued to make measurements, and in 1764 Daubenton published a noteworthy contribution to craniometry. Six years later, Pieter Camper, distinguished both as an artist and as an anatomist, published very interesting an account of his craniometrical methods, and these may be fairly claimed as having laid the foundation of all subsequent work. That work has been described above as anthropological, but as the studies thus defined are very varied in extent, it is necessary to consider the subdivisions into which they naturally fall.

In the first place (and omitting further reference to the contributions of artists), it has been explained that the measurements were first made with a view to elucidating the comparison of the skulls of men with those of other animals. This wide comparison constitutes the first subdivision of craniometric studies. And craniometric methods have rendered the results of comparison much more clear and comprehensible than was formerly the case. It is further remarkable that among the first measurements employed angular determinations occur, and indeed the name of Camper is chiefly perpetuated in anthropological literature by the "facial angle" invented by that artist-anatomist (fig. 1). It appears impossible to improve on the simple terms in which

FIG. 21

Fig. 21. - The skull and head of a young orang-utan, and of a negro, showing the lines including the facial angle (MGND) devised by Pieter Camper.

Camper describes the general results of the employment of this angle for comparative purposes, as will appear from the following brief extract from the translation of the original work: "The two extremities of the facial line are from 70 to 80 degrees from the nose to the Grecian antique, make it under 70, and you describe an orang or an ape: lessen it still more, and you have the head of a dog. Increase the minimum, and you form a fowl, a snipe for example, the facial line of which is nearly parallel with the horizon." (Camper's Works, p. 42, translated by Cogan, 1821.)

In the 19th century the names of notable contributors to the literature of craniometry quickly increase in number; while it is impossible to analyse each contribution, or even record a complete list of the names of the authors, it must be added that for the purposes of far-reaching comparisons of the lower animals with mankind, craniometric methods were used by P. P. Broca in France and by T. H. Huxley (figs. 2 and 3) in England, with such genius and success as have not yet been surpassed.

The second division of craniometric studies includes those in which the skulls of the higher and lower races of mankind are compared. And in this domain, the advent of accurate numerical methods of recording observations brought about great advances. In describing the facial angle, it will be seen that the modern European, the Greek of classical antiquity and the Negro are compared. Thus it is that Camper's name appears as that of a pioneer in this second main division of the subject. Broca and Huxley cultivated similar comparative racial fields of research, but to these names that of Anders Retzius of Stockholm must be added here. The chief claim of Retzius to distinction rests on the merits of his system of comparing various dimensions of the skull, and of a classification based on such comparisons. These indices will be further defined below. It is convenient to mention here that the first aim of all these investigators was to obtain from the skull reliable data having reference to the form and size of the brain once contained within it. Only in later days did the tendency to overlook this, the fundamental aim and end
of craniometry, make its appearance; such nevertheless was the case, much to the detriment of craniometric science, which for a time seems to have become purely empirical.

The third subdivision of craniometric researches is one in which the field of comparison is still further narrowed. For herein the various sub-racial types such as the dark and fair Europeans are brought together for the purposes of comparison or contrast. But although the range of research is thus narrowed and restricted, the guiding principles and the methods remain unchanged. In this department of craniometry, Anders Retzius has gained the foremost place among the pioneers of research.

One striking result was to exhibit a most marked contrast in respect of the breadth-index of the skull, between the Lapps and their Scandinavian neighbours, and thus a craniometric difference was added to the list of characters (such as stature, hair-colour and complexion) whereby these two types were already distinguished. Since the publication of Retzius's studies, the cephalic or breadth-index of the skull has retained a premier position among its almost innumerable successors, though it is of historical interest to note that, while Retzius had undoubtedly devised the method of comparing "breadth-indices," he always qualified the results of its use by reference to other data. These qualifications were overlooked by the immediate successors of Retzius, such as the disadvantage of craniometry. In addition to the researches on the skull, others dealing with the comparison of Finns and Swedes (by Retzius) as well as the investigation of the form of skull in Basques and Guanches (by Broca), possess historic interest.

Thus far little or nothing has been said with regard to instruments. Camper devised a four-sided open frame with cross-wires, through which skulls were viewed and by means of which accurate drawings could be projected on to paper. The methods of Retzius as here described require the aid of callipers of various sorts, and such instruments were quickly devised and applied to the special needs of the case. Such instruments are still in use, and the forms of simple craniometer are shown in the accompanying illustrations (figs. 5 and 6). For the more accurate comparison required in the study of various European types, delicate instruments for measuring angles were invented by Anthelme in Paris (1836) and John Grattan in Belfast (1853). These instruments enabled the observer to transmit to the plane surface of a sheet of drawing paper a correct tracing of the contour of the specimen under investigation. A further modification was devised by the talented Dr Busk in the year 1861, and since that date the number and forms of these instruments have been greatly multiplied. With reference to contributors to the advance of knowledge in this particular department of craniometry, there should be added the following names: those of Huxley, Sir W. H. Flower and Sir W. Turner in England, J. L. A. Quatrefages in France, J. C. G. Lucea and H. Welcker in Germany. Moreover, the methods have also been multiplied, so that in addition to angular and linear measurements, those of the capacity or cubical contents of the cranium and those of the curvature of its surface demand reference. The masterly work of Cleland claims special mention in this connexion. And finally while two dimensions are combined in the cephalic index of Retzius, the combination of three dimensions (in a formula called a modulus) distinguishes some recent work, although the employment of the modulus is

**Fig. 2.**—The sphenothmoidal, sphenomaxillary and foramino-basal angles are shown in the crania of:—A, a New Britain native (male); B, a gorilla (male); C, a dog. N.Pr.B., Sphenothmoidal angle; P.Pr.B., Sphenomaxillary angle; Pr.B.Op., Foramino-basal angle. The sphenothmoidal and sphenomaxillary angles were first employed by Huxley.

**Fig. 3.**—The sphenothmoidal, sphenomaxillary and foramino-basal angles are shown in the crania of:—A, a New Guinea native (male); B, a European woman. N.Pr.B., Sphenothmoidal angle; P.Pr.B., Sphenomaxillary angle; Pr.B.Op., Foramino-basal angle.

Retzius's name is, as already mentioned, associated not with any particular angle or angular measurement, but rather with a method of expressing as a formula two cranial dimensions which have been measured and which are to be compared. Thus for instance one skull may be so proportioned that its greatest width measures 75% of its greatest length (i.e. its width is to its length as three to four).

This ratio (of 75%) is termed the cephalic or breadth-index, which in such an instance would be described as equal to 75.

**Fig. 4.**—Top view of skulls. (A) Negro, index 70, dolichocephalic; (B) European, index 80, mesiccephalic; (C) Samoyed, index 85, brachycephalic.

A skull providing a breadth-index of 75 will naturally possess very different proportions from another which provides a corresponding index equal to 85. And in fact this particular index in human skulls varies from about 58 to 90 in undistorted examples (fig. 4). Such is the general scheme of Retzius's system of classification of skulls by means of indices, and one of his earliest applications of the method was to the inhabitants of Sweden.

**Fig. 5.**—Callipers used in Craniometry, Professor Martin's (P. Hermann, Zürich) model.

**Fig. 6.**—Flower's Craniometer as modified by Dr W. L. H. Duckworth.
CRANK

The fourth subdivision of craniometry is closely allied to that which has just been described, and it deals with the comparison of the prehistoric and the recent types of mankind. The methods are exactly similar to those employed in the comparison of living races; but in some particular instances where the prehistoric individual is represented only by a comparatively minute portion of the skull, some special modifications of the usual procedures have been necessitated. In this field the works of W. His and L. Rütimeyer on the prehistoric races of Switzerland, those of Ecker (South Germany), of Broca in France, of Thurnam and Davis in England, must be cited. G. Schwabe, Kramberger, Fig. 7.—The facial angle of the Frankfort Agreement is shown in the crania of:—A, a New Britain native (male) 62°; B, a gorilla (male) 50°; C, a dog 42°. This angle has now replaced the facial angle of Camper (cf. fig. 1).

W. J. Sollas and H. Klaatsch are the most recent contributors to this department of craniometry. Thus the complexity of craniometric studies has inevitably increased. In the hands of von Torok of Budapest, as in those of M. Benedikt of Vienna at an earlier date, the number of measurements regarded as necessary for the complete “diagnosis” of the skull has reached a colossal total. Of the trend and progress of craniometry at the present day, three particular developments are noteworthy. First come the attempts made at various times to co-ordinate the systems of measurements so as to ensure uniformity among all observers; of these attempts two will be mentioned, viz. that of the German anthropologists at Frankfort in 1882 (figs. 7 and 8), and that of the Anthropometric Committee of the British Association (1906) seem to require at least a record. In the second place, the application of the methods of statistical science in dealing with large numbers of craniometric data has been richly rewarded in Prof. Karl Pearson’s hands. Thirdly, and in connexion with such methods, there may be mentioned the extension of these systems of measurement, and of the methods of dealing with them on statistical principles, to the study of large numbers of the skulls of domestic and feral animals, such as white rats or the varieties of the horse. And lastly no account of craniometry would be complete without mention of the revolt, headed by the Italian anthropologist Sergi, against metrical methods of all kinds. It cannot, however, be alleged that the substitutes offered by the adherents of Sergi’s principles encourage others to forsake the more orthodox numerical methods.

Fig. 8.—The facial angle of the Frankfort Agreement is shown in the crania of:—A, a New Guinea native (male) 75°; B, a European (woman) 93°; C, a new-born infant (93°).

Association (1906) seem to require at least a record. In the second place, the application of the methods of statistical science in dealing with large numbers of craniometric data has been richly rewarded in Prof. Karl Pearson’s hands. Thirdly, and in connexion with such methods, there may be mentioned the extension of these systems of measurement, and of the methods of dealing with them on statistical principles, to the study of large numbers of the skulls of domestic and feral animals, such as white rats or the varieties of the horse. And lastly no account of craniometry would be complete without mention of the revolt, headed by the Italian anthropologist Sergi, against metrical methods of all kinds. It cannot, however, be alleged that the substitutes offered by the adherents of Sergi’s principles encourage others to forsake the more orthodox numerical methods.

CRANK, a word of somewhat obscure etymology, probably connected with a root meaning “crooked,” and appearing in the Ger. crank, ill, a figurative use of the original word; among other words in English containing the same original meaning are “cringe” and “crinkle.” In mechanics, a crank is a device by which reciprocating motion is converted into circular motion or vice versa, consisting of a crank-arm, one end of which is fastened rigidly at right angles to the rotating shaft or axis, while the other end bears a crank-pin, projecting from it at right angles and parallel to the shaft. When the reciprocating part of a machine, as the piston and piston-rod of a steam engine, is linked to this crank by a crank-rod or connecting rod, one end of which works on the crank-pin and the other on a pin in the end of the reciprocating part, the to-and-fro motion of the latter imparts a circular motion to the shaft and vice versa. The crank, instead of being made up as described above, may be formed by bending the shaft to the required shape, as sometimes in the handle of a winch. A bell-crank, so called because of its use in bell-hanging to change the direction of motion of the wires from horizontal to vertical or vice versa, consists of two arms rigidly connected at an angle, say of 90°, to each other and pivoted on a pin placed at the point of junction.

Crank is also the name given to a labour machine used in prisons as a means of punishment (see TREAD-MILL). Other uses of the word, connected with the primary meaning, are for a crooked path, a crevice or chink; and a freakish turn of thought or speech, as in Milton’s phrase “quips and cranks.” It is also used as a slang expression, American in origin, for a harmless
lunatic, or a faddist, whose enthusiasm for some one idea or hobby becomes a monomania. "Crank" or "crank-sided" is a nautical term used of a ship which by reason of her build or from want of balance is liable to overturn. This strict nautical sense is often confused with "crank" or "cranky," that is, rickety or shaky, probably derived direct from the German "krank, weak or ill."

CRANMER, THOMAS (1489–1556), archbishop of Canterbury, born at Aslacton or Aslockton in Nottinghamshire on the 2nd of July 1489, was the second son of Thomas Cranmer and of his wife Anne Hatfield. He received his early education, according to Morice his secretary, from "a marvellous severe and cruel schoolmaster," whose discipline must have been severe indeed to deserve this special mention in an age when no schoolmaster bore the rod in vain. The same authority tells us that he was initiated by his father in those field sports, such as hunting and hawking, which formed one of his recreations in after life. To early training he also owed the skillful horsemanship for which he was conspicuous. At the age of fourteen he was sent by his mother, who had in 1501 become a widow, to Cambridge. Little is known with certainty of his university career beyond the fact that he became a fellow of Jesus College in 1510 or 1511, that he had soon after to vacate his fellowship, owing to his marriage to "Black Joan," a relative of the landlady of the Dolphin Inn, and that he was reinstated in it on the death of his wife, which occurred in childbirth before the lapse of the year of grace allowed by the statutes. During the brief period of his married life he held the appointment of lecturer at Buckingham Hall, now Magdalene College. The fact of his marrying would seem to show that he did not at the time intend to enter the church; possibly the death of his wife caused him to qualify for holy orders. He was ordained in 1523, and soon after he took his doctor's degree in divinity. According to Strype, he was invited about this time to become a fellow of the college founded by Cardinal Wolsey at Oxford; but Dean Hook shows that there is some reason to doubt this. If the offer was made, it was declined, and Cranmer continued at Cambridge filling the offices of lecturer in divinity at his own college and of public examiner in divinity to the university. It is interesting, in view of his later efforts to spread the knowledge of the Bible among the laity, to know that in the capacity of examiner he insisted on a thorough acquaintance with the Holy Scriptures, and rejected several candidates who were deficient in this qualification.

It was a somewhat curious concurrence of circumstances that transferred Cranmer, almost at one step, from the quiet seclusion of the university to the din and bustle of the court. In August 1529 the plague known as the sweating sickness, which prevailed throughout the country, was specially severe at Cambridge, and all who had it in their power forsook the town for the country. Cranmer went with two of his pupils named Cressy, related to him through their mother, to their father's house at Waltham in Essex. The king (Henry VIII.) happened at the time to be visiting in the immediate neighbourhood, and two of his chief counsellors, Gardiner, secretary of state, afterwards bishop of Winchester, and Edward Fox, the lord high almoner, afterwards bishop of Hereford, were lodged at Cressy's house. Meeting with Cranmer, they were naturally led to discuss the king's mediated divorce from Catherine of Aragon. Cranmer suggested that if the canonists and the universities should decide that marriage with a deceased brother's widow was illegal, and if it were proved that Catherine had been married to Prince Arthur, her marriage to Henry could be declared null and void by the ordinary ecclesiastical courts. The necessity of an appeal to Rome was thus dispensed with, and this point was at once seen by the king, who, when Cranmer's opinion was reported to him, is said to have ordered him to be summoned in these terms: "I will speak to him. Let him be sent for out of hand. This man, I trow, has got the right sow by the ear."

At their first interview Cranmer was commanded by the king to lay aside all other pursuits and to devote himself to the question of the divorce. He was to draw up a written treatise, stating the course he proposed, and defending it by arguments from scripture, the fathers and the decrees of general councils. His material interests certainly did not suffer by compliance. He was commended to the hospitality of Anne Boleyn's father, the earl of Wiltshire, in whose house at Durham Place he resided for some time; the king appointed him archdeacon of Taunton and one of his chaplains; and he also held a parochial benefice, the name of which is unknown. When the treatise was finished Cranmer was called upon to defend its argument before the universities of Oxford and Cambridge, which he visited, accompanied by Fox and Gardiner. Immediately afterwards he was sent to plead the cause before a more powerful if not a higher tribunal. An embassy, with the earl of Wiltshire at its head, was despatched to Rome in 1530, that "the matter of the divorce should be disputed and ventilated," and Cranmer was an important member of it. He was received by the Pope with marked courtesy, and was appointed "Grand Penitentiary of England," but his argument, if he ever had the opportunity of stating it, did not lead to any practical decision of the question.

Cranmer returned in September 1530, but in January 1531 he received a second commission from the king appointing him "Concilarius Regii et ad Caesarem Orator." In the summer of 1531 Cranmer accordingly proceeded to Germany as sole ambassador to the emperor. He was sent in October to the city of Nuremberg, and there with a view to an alliance, and to obtain the removal of some restrictions on English trade. At Nuremberg he became acquainted with Osiander, whose somewhat isolated theological position he probably found to be in many points analogous to his own. Both were convinced that the old order must change; neither saw clearly what the new order should be to which it was to give place. They had frequent interviews, which had doubtless an important influence on Cranmer's opinions. But Osiander's house had another attraction of a different kind from theological sympathy. His niece Margaret won the heart of Cranmer, and in 1532 they were married. Hook finds in the fact of the marriage corroboration of Cranmer's statement that he never expected or desired the primacy; and it seems probable enough that, if he had foreseen how soon the primacy was to be forced upon him, he would have avoided a disqualification which it was difficult to conceal and dangerous to disclose.

Expected or not, the primacy was forced upon him within a week or two of his marriage. In August 1532 Archbishop Warham died, and the king almost immediately afterwards intimated to Cranmer, who had accompanied the emperor in his campaign against the Turks, his nomination to the vacant see. Cranmer's conduct was certainly consistent with his profession that he did not desire, as he had not expected, the dangerous promotion. He sent his wife to England, but delayed his own return in the vain hope that another appointment might be made. The papal bulls of confirmation were dated February and March 1533, and the consecration took place on the 30th March. One peculiarity of the ceremony had occasioned considerable discussion. It was the custom for the archbishop elect to take two oaths, the first of episcopal allegiance to the pope, and the second in recognition of the royal supremacy. The latter was so wide in its scope that it might fairly be held to supersede the former in so far as the two were inconsistent. Cranmer, however, was not satisfied with this. He had a special protest recorded, in which he formally declared that he swore allegiance to the pope only in so far as that was consistent with his supreme duty to the king. The morality of this course has been much canvassed, though it seems really to involve nothing more than an express declaration of what the two oaths implied. It was the course that would readily suggest itself to a man of timid nature who wished to secure himself against such a fate as Wolsey's. It showed weakness, but it added nothing to whatever immorality there might be in successively taking two incompatible oaths.

In the last as in the first step of Cranmer's promotion Henry had been acted upon by one and the same motive. The business of the divorce—or rather, of the legitimation of Anne Boleyn's expected issue—had now become very urgent, and in the new archbishop he had an agent who might be expected to forward it with the needful haste. The celerity and skill with which
Cranmer did the work intrusted to him must have fully satisfied his master. During the first week of April Convocation sat almost from day to day to determine questions of fact and law in relation to Catherine’s marriage with Henry, as affected by her previous marriage with his brother Arthur. Decisions favourable to the object of the king were given on these questions, though even the despotism of the most despotic of the Tudors failed to secure absolute unanimity. The next step was taken by Cranmer, who wrote a letter to the king, praying to be allowed to remove the anxiety of loyal subjects as to a possible case of disputed succession, by finally determining the validity of the marriage in his archiepiscopal court. There is evidence that the request was promptly by the king, and his consent was given as a matter of course. Queen Catherine was residing at Amphil in Bedfordshire, and to suit her convenience the court was held at the priory of Dunstable in the immediate neighbourhood. Declining to appear, she was declared contumacious, and on the 23rd of May the archbishop gave judgment declaring the marriage null and void from the first, and so leaving the king free to marry whom he pleased. The Act of Appeals had already prohibited any appeal from the archbishop’s court. Five days later he pronounced the marriage between Henry and Anne—which had been secretly celebrated about the 29th of January 1533—to be void, and on the 1st of June Cranmer, by the 10th of September Anne Godfather to her child, the future Queen Elizabeth.

The breach with Rome and the subjection of the Church in England to the royal supremacy had been practically achieved before Cranmer’s appointment as archbishop; and he had little to do with the other constitutional changes of Henry’s reign. But his position as chief minister of Henry’s ecclesiastical jurisdiction formed in him an element of public interest. His marriage with Anne Boleyn, and the birth of their children, was a bar to his marriage with Anne—a bar which had been removed by papal dispensation in 1537, but now the papal power to dispense in such cases had been repudiated, and the original objection revived. The sentence was grotesquely legal and unjust. With Anne’s condemnation by the House of Lords Cranmer had nothing to do. He interpolated the princess of the blood was dead in the family of Fisher, More and the monks of Christchurch. His share in the divorce of Anne of Cleves was of less importance than that of Gardiner, though he did preside over the Convocation in which nearly all the dignitaries of the church signed their approval of that measure. To his next and last interposition in the matrimonial affairs of the king no discredit attaches itself. When he was made cognizant of the charges against Catherine Howard, his duty to communicate them to the king was obvious, though painful.

Meanwhile Cranmer was actively carrying out the policy which had associated his name more closely, perhaps, than that of any other ecclesiastic with the Reformation in England. Its most important feature on the theological as distinct from the political side was the endeavour to promote the circulation of the Bible in the vernacular, by encouraging translation and procuring an order in 1538 that a copy of the Bible in English should be set up in every church in a convenient place for reading. Only second in importance to this was the re-adjustment of the creed and liturgy of the church, which formed Cranmer’s principal work during the latter half of his life. The principle which he espoused was that of a middle Protestantism, if it may be so called, which he did so much to impress on the formularies of the Church of England, was gradual, as a brief enumeration of the successive steps in that progress will show. In 1538 an embassy of German divines visited England with the design, among other things, of forming a common confession for the two countries. This proved impracticable, but the frequent conferences Cranmer had with the theologians composing the embassy had doubtless a great influence in modifying his views. Both in parliament and in Convocation he opposed the Six Articles of 1539, but he stood almost alone. During the period between 1540 and 1543 the archbishop was engaged at the head of a commission in the revision of the “Bishop’s Book” (1537) or Institutions of a Christian Man, and the preparation of the Necessarie Erudition (1543) known as the “King’s Book,” which was a modification of the former work in the direction of Roman Catholic doctrine. In June 1545 was issued his Litany, which was substantially the same as that now in use, and shows his mastery of a rhythmical English style.

The course taken by Cranmer in promoting the Reformation exposed him to the bitter hostility of the reactionary party or “men of the old learning,” of whom Gardiner and Bonner were leaders, and on various occasions—notably in 1543 and 1545—conspiracies were formed in the council or elsewhere to effect his overthrow. The king, however, remained true to him, and all the conspiracies signal failed. It illustrates a favourable trait in the archbishop’s character that he forgave all the conspirators. He was, as his secretary Morice testifies, “a man that delighted not in revenging.”

Cranmer was present with Henry VIII. when he died (1547). By the will of the king he was nominated one of a council of fifteen of ecclesiastics, and in the following year he acquiesced in the arrangement by which Somerset became lord protector. He officiated at the coronation of the boy king Edward VI., and is supposed to have instituted a sinister change in the order of the ceremony, by which the right of the monarch to reign was made to appear to depend upon inherance alone, without the concurrent consent of the people. But Edward’s title had been expressly sanctioned by act of parliament, so that there was no more room for election in his case than in that of George I., and the real motive of the changes was to shorten the weary ceremony for the frail child.

During this reign the work of the Reformation made rapid progress, the sympathies both of the Protector and of the young king being decidedly Protestant. Cranmer was therefore enabled without let or hindrance to complete the preparation of the church formularies, on which he had been for some time engaged. In 1547 appeared the Homilies prepared under his direction. Four of them are attributed to the archbishop himself—those on Salvation, Faith, Good Works and the Reading of Scripture. His translation of the German Catechism of Justus Jonas, known as Cranmer’s Catechism, appeared in the following year. Important, as showing his views on a cardinal doctrine, was the Defence of the True and Catholic Doctrine of the Sacrament, which he published in 1550. It was immediately answered from the side of the “old learning” by Gardiner. The first prayer-book of Edward VI. was finished in November 1548, and received legal sanction in March 1549, the second was completed and sanctioned in April 1552. The archbishop did much of the work of compilation personally. The forty-two articles of Edward VI. published in 1553 owe their form and style almost entirely to the hand of Cranmer. The last great undertaking in which he was employed was the revision of his codification of the canon law, which had been all but completed before the death of Henry. The task was one eminently well suited to his powers, and the execution of it was marked by great skill in definition and arrangement. It never received any authoritative sanction, Edward VI. dying before the proclamation establishing it could be made, and it remained unpublished until 1571, when a Latin translation by Dr Walter Haddon and Sir John Cheke appeared under the title Reformatio legum ecclesiasticarum. It laid down the lawfulness and necessity of persecution to the death of heresy in the most absolute terms; and Cranmer himself condemned Joan Bocher to the flames. But he naturally loathed persecution, and was as tolerant as any in that age.

Cranmer stood by the dying bed of Edward as he had stood by that of his father, and he there suffered himself to be persuaded to take a step against his own convictions. He had pledged himself to respect the testamentary disposition of Henry VIII. by which the succession devolved upon Mary, and now he violated his oath by signing Edward’s “device” of the crown to Lady Jane Grey.
On grounds of policy and morality alike the act was quite indefensible; but it is perhaps some palliation of his perjury that it was committed to satisfy the last urgent wish of a dying man, and that he alone remained true to the nine days’ queen when the others who had with him signed Edward’s device deserted her. On the accession of Mary he was summoned to the council—most of whom had signed the same device—reprimanded for his conduct, and ordered to confine himself to his palace at Lambeth until the queen’s pleasure was known. He refused to follow the advice of his friends and avoid the fate that was clearly impending over him by flight to the continent. Any chance of safety that lay in the friendliness of a strong party in the council was more than nullified by the bitter personal enmity of the queen, who could not forgive his share in her mother’s divorce and her own disgrace. On the 14th of September 1553 he was sent to the Tower, where Ridley and Latimer were also confined. The immediate occasion of his imprisonment was a strongly worded declaration he had written a few days previously against the mass, the celebration of which, he heard, had been re-established at Canterbury. He had not taken steps to publish this, but by some unknown channel a copy reached the council, and it could not be ignored. In November, with Lady Jane Grey, his wife, and two other Dudleys, Cranmer was condemned to treason. Renard thought he would be executed, but so true a Romanist as Mary could scarcely have an ecclesiastical put to death in consequence of a sentence by a secular court, and Cranmer was reserved for treatment as a heretic by the highest of clerical tribunals, which could not act until parliament had restored the papal jurisdiction. Accordingly in March 1554 he and his two illustrious fellow-prisoners, Ridley and Latimer, were removed to Oxford, where they were confined in the Bocardo or common prison. Ridley and Latimer were unflinching, and suffered bravely at the stake on the 16th of October 1555. Cranmer had been tried by a papal commission, over which Bishop Brooke, of Gloucester, presided, in September 1555. Brooke had no power to give sentence, but reported to Rome, where Cranmer was summoned, but not permitted, to attend. On the 25th of November he was pronounced contumacious by the pope and excommunicated, and a commission was sent to England to degrade him from his office of archbishop. This was done with the usual humiliating ceremonies in Christ Church, Oxford, on the 14th of February 1556, and he was then handed over to the secular power. About the same time Cranmer subscribed the first two of his “recantations.” His difficulty consisted in the fact that, like all Anglicans of the 16th century, he recognized no right of private judgment, but believed that the state, as represented by monarchy, parliament and Convocation, had an absolute right to determine the national faith and to impose it on every Englishman. All these authorities had now legally established Roman Catholicism as the national faith, and Cranmer had no logical ground on which to resist. His early “recantations” are merely recognitions of his lifelong conviction of the right of the state. But his dilemma on this point led him to further doubts, and he was eventually induced to revile his whole career and the Reformation. This is what the government wanted. Northumberland’s recantation had done much to discredit the Reformation, Cranmer’s, it was hoped, would complete the work. Hence the enormous effect of Cranmer’s recovery at the final scene. On the 21st of March he was taken to St Mary’s church, and asked to repeat his recantation in the hearing of the people as he had promised. To the surprise of all he declared with dignity and emphasis that what he had recently done troubled him more than anything he ever did or said in his whole life; that he renounced and refused all his recantations as things written with his hand, contrary to the truth which he thought in his heart; and that as his hand had offended, his hand should be first burned when he came to the fire. As he had said, his right hand was steadfastly exposed to the flames. The calm cheerfulness and resolution with which he met his fate show that he felt that he had cleared his conscience, and that his recantation of his recantations was a repentance that needed not to be repented of. It was a noble end to what, in spite of its besetting sin of infirmity of moral purpose, was a not ignoble life. The key to his character is well given in what Hooper said of him in a letter to Bullinger, that he was too fearful about what might happen to him.” This weakness was the worst which Cranmer’s character, but it was due in some measure to his painful death. Not seeing both sides of a question at the same time, a temperament fatal to martyrdom. As a theologian it is difficult to class him. As early as 1538 he had repudiated the doctrine of Transubstantiation; but by 1550 he had rejected also the Real Presence (Pref. to his Answer to Dr Richard Smith). But here he used the term “real” somewhat unguardedly, for in his Defence he asserts a real presence, but defines it as exclusively a spiritual presence; and he repudiates the idea that the bread and wine were “bare tokens.” His views on church polity were dominated by his implicit belief in the divine right of kings (not of course the divine hereditary right of kings) which the Angliscans felt it necessary to set up against the divine right of popes. He set practically no limits to the ecclesiastical authority of kings; they were as fully the representatives of the church as the state, and Cranmer hardly distinguished between the two. Church and state to him were one.

AUXILIARIES.—Letters and Papers of Henry VIII. vols. iv.-xx. Acts of the Privy Council, 1542-1556; Col. of State Papers, Dom. and Foreign; Foxe’s Acts and Monuments; Strype’s Memorials of Cranmer (1694); Anecdotes and Character of Archbishop Cranmer, by J. Morice, and by W. Strype; the English original of the Burnet biographies (Camden Society’s publications); Remains of Thomas Cranmer, by W.anvas (1833); Lives of Cranmer, by Gilpin (1784), Todd (1831), Le Bas, in Hook’s Lives of the Archbishops of Canterbury, vols. vi. and vii. (1868), by Canon Mason (1897.), A. D. Innes (1900) and A. F. Pollard (1904); Froude’s History; R. W. Dyer’s History; J. Gairdner’s History of the Church, 1485-1558; Bishop Cranmer’s Recantacions, ed. Gairdner (1885). R. E. Chester Waters’s Chesters of Chicheley (1887) contains a vast amount of genealogical information about Cranmer who appears to have been highly valued by some of his contemporaries. (F. P.)

CRANNOG (Celt. crann, a tree), the term applied in Scotland and Ireland to the stockaded islands so numerous in ancient times in the lochs of both countries. The existence of these lake-dwellings in Scotland was first made known by John Mackinlay, a fellow of the Society of Antiquaries of Scotland, in a letter sent to George Chalmers, the author of Caledonia, in 1813, describing two crannogs, or fortified islands in Bute. The crannog of Lagore, the first discovered in Ireland, was examined and described by Sir William Wilde in 1840. But it was not until after the discovery of the pile-villages of the Swiss lakes, in 1853, that drawn public attention to the subject of lake-dwellings, that the crannogs of Scotland and Ireland were systematically investigated.

The results of these investigations show that they have little in common with the Swiss lake-dwellings, except that they are placed in lakes. Few examples are known in England, although over a hundred and fifty have been examined in Ireland, and more than half that number in Scotland. As a rule they have been constructed on islets or shallows in the lochs, which have been adapted for occupation and fortified by churches or other lines of stockaded defences drawn round the margin. To enlarge the area, or raise the surface-level where that was necessary, layers of logs, brushwood, heather and ferns were piled on the shallow, and consolidated with gravel and stones. Over there was laid a layer of earth, a floor of logs or a pavement of flagstones. In rare instances the body of the work is entirely of stones, the stockaded defence and the huts within its enclosure being the only parts constructed of timber. Occasionally a bridge of logs, or a causeway of stones, formed a communication with the shore, but often the only means of getting to and from the island was by canoes hollowed out of a single tree. Remains of huts of logs, or of wattled work, are often found within the enclosure. Three crannogs in Dowalton Loch, Wigtownshire, examined by Lord Lovaine in 1863, were found to be constructed of layers of fern and birch and hazel branches, mixed with boulders and penetrated by oak piles, while above all there was a surface layer of stones and soil. The remains of the stockade round the margin were of vertical piles mortised into horizontal bars, and secured by pegs in the mortised holes. The crannog of...
CRANSAC—CRANTOR

Lochlee, near Tarbolton, Ayrshire, explored by Dr R. Munro in 1878, was 100 ft. in diameter, and had a double row of piles, bound by horizontal stretchers with square mortise-holes, enclosing an area 60 ft. in diameter. In the centre was a space 40 ft. square, bounded by the remains of a wooden wall and paved inside with split logs. A partition divided it into two equal parts, one of which had a doorway opening to the south, and close by it an extensive refuse-heap. In the middle of the other part was a stone-paved hearth, with remains of three former hearths underneath. The substructure was built up from the bottom of the loch, partly of brushwood but chiefly of logs and trunks of trees with the branches lopped off, placed in layers, each disposed transversely or obliquely across the one below it. A crannog in Loch-an-Dhugael, Balinakill, Argyllshire, described by the same explorer in 1863, revealed a substructure similar to that at Lochlee, with a double row of piles enclosing an area 45 to 50 ft. in diameter, within which was a circular construction 32 ft. in diameter, which had been supported by a large central post and about twenty uprights ranged round the circumference.

From their common feature of a substructure of brushwood and logs built up from the bottom, the crannogs have been classed as fasce-dwellings, to distinguish them from the typical pile-dwellings of the earlier periods in Switzerland, whose platforms are supported by piles driven into the bed of the lake. The crannog of Cloonfinlough in Connaught had a triple stockade of oak piles, connected by horizontal stretchers and enclosing an area 130 ft., in diameter, laid with trunks of oak trees. In the crannog of Lagore, county Meath, there were about 150 cartloads of bones, chiefly of oxen, deer, sheep and swine, the refuse of the food of the occupants. In the crannog of Lisnacrogher, county Antrim, iron swords, with sheaths of thin bronze ornamented with scrolls characteristic of the Late Celtic style, iron daggers, an iron spear-head 16½ in. in length, and pieces of what are called large caldrons of iron, were found. Among the few remains of lacustrine settlements in England and Wales, some are suggestive of the typical crannog structure. The most important of these is the Glastonbury lake village, excavated by Mr R. Bulleid and Mr St George Gray. It consists of more than sixty separate dwellings, grouped within a triangular palisaded defence, formed in the midst of a marsh now partially reclaimed. The dwellings were circular, from 18 to 35 ft. in diameter, the substructure formed of logs and brushwood mingled with stones and clay, and outlined by piles driven into the bottom of the shallow lake. The walls of the houses seem to have been made of wattle-work, supported by posts sometimes not more than a single foot apart. The floors are of clay, with a hearth of stones in the centre, often showing several renewals over the original. The relics discovered show unmistakably that the occupation must be dated within the Iron Age, but probably pre-Roman, as no evidence of contact with Roman civilization has been discovered. The stage of civilization indicated is nevertheless not a low one. Besides the implements and weapons of iron there are fibulæ and brooches of bronze, weaving combs and spindle-whorls, a bronze mirror and tweezers, knives as well as throwing-hoops, ornamented with Late Celtic patterns, a bowl of thin bronze decorated with bosses, the nave of a wooden wheel with holes for twelve spokes, and a dug-out canoe. Another site in Holderness, Yorkshire, examined by Mr Boynton in 1881, yielded evidence of fasce construction, with suggestions of occupation in the latter part of the Bronze Age. Similar indications are adduced by Professor Boyd Dawkins from the site on Barton Mare. On the other hand, the implements and weapons found in the Scottish and Irish crannogs are usually of iron, or, if objects of bronze and stone are found, they are commonly such as were in use in the Iron Age. Crannogs are frequently referred to in the Irish annals. Under the year 848 the Annals of the Four Masters record the burning of the island of Lough Ghabh (the crannog of Lagore), and the same stronghold is noticed as again destroyed by the Danes in 933. Under the year 1248 it is recorded that Turlough O'Connor made his escape from the crannog of Lough Leisi, and drowned his keepers. Many other entries occur in the succeeding centuries. In the register of the priory council of Scotland, April 14, 1608, it is ordered that “the hall housie of defence, strongholds, and cransachs in the Yllis (the western isles) pertaining to Angus M’Connel of Dunnavayg and Hector M’Clayne of Dowart sal be deliverit to His Majestie.” Judging from the historical evidence of their late continuance, and from the character of the relics found in them, the crannogs may be included among the latest prehistoric strongholds, reaching their greatest development in early historic times, and surviving through the middle ages. In Ireland, Sir William Wilde has assigned their range approximately to the period between the 6th and 16th centuries; while Dr Munro holds that the vast majority of them, both in Ireland and in Scotland, were not only inhabited, but constructed during the Iron Age, and that their period of greatest development was as far posterior to Roman civilization as that of the Swiss Pfahlbauten was anterior to it. (See Lake Dwellings.)

CRANSAC, a town of southern France, in the department of Aveyron, 28 m. N.W. of Rodez by rail. Pop. (1906) town, 4988; commune, 6933. The town is a coal-mining centre and has coal and mineral springs, known in the middle ages. There are iron-mines in the neighbourhood. Hills to the north of the town contain disused coal-mines which have been on fire for centuries. About 5 m. to the south is the Fine Renaissance château of Bournazel, built for the most part by Jean de Buissou, baron of Bournazel, about 1545. The barony of Bournazel became a marquisate in 1624.

CRANSTON, a city of Providence county, Rhode Island, U.S.A., adjoining the city of Providence on the S. Pop. (1890) 8000; (1900) 13,543; (1910) 21,107; area, 30 sq. m. It is served by the New York, New Haven & Hartford railway. The surface of the E. part is level, that of the W. part is somewhat rolling. Within the city are several villages, including Arlington, Auburn, Edgewood, Fiskeville and Oaklawn. The inhabitants of the country districts are engaged largely in the growing of hay, Indian corn, rye, oats and market-garden produce; in the several villages cotton and print goods, fuses for electrical machinery, and automatic fire-protection sprinklers are manufactured. The value of Cranston's factory product increased from $1,402,359 in 1900 to $2,105,960 in 1905, or 52%. The city has a farm of 667 acres in the S. part of the city; on this a the state prison, the Providence county jail, the state workhouse and the house of correction, the state almshouse, the state hospital for the insane, the Sockummsett school for boys, and the Oaknook (1865); Sir W. M’Clintock, Proceedings of the state reform school. The post-office address of all these state institutions is Howard. Cranston was settled as a part of Providence about 1640 by associates of Roger Williams, and in 1754 was incorporated as a separate township, but in 1868, in 1873 and in 1892 portions of it were reannexed to Providence. The township is said to have been named in honour of Samuel Cranston (1659–1727), governor of Rhode Island from 1698 until his death. It was incorporated as a city in 1910.

CRANTOR, a Greek philosopher of the Old Academy, was born, probably about the middle of the 4th century B.C., at Soli in Cilicia. He was a fellow-pupil of Polemo in the school of Xenocrates at Athens, and was the first commentator on Plato. He is said to have written some poems which he sealed up and deposited in the temple of Athens at Soli (Diog. Laertius iv. 5. 25). Of his celebrated work On Grief (Περὶ θυμοῦ), a letter of condolence to his friend Hippocrates on the death of his children, numerous extracts have been preserved in Plutarch's Consolatio ad Apollonium and in the De consolatione of Cicero,
who speaks of it (Acad. ii. 44. 135) in the highest terms (saeuleus et ad verbum ediscendus). Cranor paid especial attention to ethics, and arranged “good” things in the following order—

Cranworth, Robert Monsey Rolfe, Baron (1790–1868), lord chancellor of England, elder son of the Rev. E. Rolfe, was born at Cranworth, Norfolk, on the 18th December 1790. Educated at Bury St Edmunds, Winchester, and Trinity College, Cambridge, he was called to the bar at Lincoln’s Inn in 1816, and attached himself to the chancery courts. He represented Penryn and Falmouth in parliament from 1832 till his promotion to the bench as baron of the exchequer in 1839. In 1850 he was appointed a vice-chancellor and created Baron Cranworth, and in 1852 he became lord chancellor in Aberdeen’s ministry. He continued to hold the chancellorship in the administration of Palmerston until the latter’s resignation in 1857. He was not reappointed when Palmerston returned to office in 1859, but on the retirement of Lord Westbury in 1865 he accepted the great seal for a second time, and held it till the fall of the Russell administration in 1866. Cranworth died in London on the 26th of July 1868. Never a very zealous law reformer, Cranworth’s name is associated in the statute book with only one small measure on conveyancing. But as a judge he will continue to hold first rank. His judgments were marked by sound common sense and founded upon a firm grasp of the prejudices of his profession. Few men of his day enjoyed greater personal popularity than Cranworth. He left no issue and the title became extinct on his death.

CRAPE (an Anglicized version of the Fr. crape), a silk fabric of a greyish texture, having a peculiar crisp or creped appearance. It is woven of hard spun silk yarn “in the gum” or natural condition. There are two distinct varieties of the textile—soft, Canton or Oriental crape, and hard or creped crape. The wavy appearance of Canton crape results from the peculiar manner in which the weft is prepared, the yarn from two bobbins being twisted together in the reverse way. The fabric when woven is smooth and even, having no creped appearance, but when the gum is subsequently extracted by boiling it at once becomes soft, and the weft, losing its twist, gives the fabric the wavy structure which constitutes its distinguishing feature. Canton crepes are used, either white or coloured, for ladies’ scarves and shawls, bonnet trimmings, &c. The Chinese and Japanese excel in the manufacture of soft crepes. The crisp and elastic structure of hard crape is not produced either in the spinning or in the weaving, but is due to processes through which the gauze passes after it is woven. What the details of these processes are is known to only a few manufacturers, who so jealously guard their secret that, in some cases, the different stages in the manufacture are conducted in towns far removed from each other. Commercially they are distinguished as single, double, three-ply and four-ply crepes, according to the nature of the yarn used in their manufacture. They are almost exclusively dyed black and used in mourning dress, and among Roman Catholic communities for nun’s veils, &c. In Great Britain hard crepes are made at Braintree in Essex, Norwich, Yarmouth, Manchester and Glasgow. The crape formerly made at Norwich was made with a silk warp and worsted weft; and is said to have afterwards degenerated into bombazine. A very successful imitation of real crape is made in Manchester of cotton yarn, and sold under the name of Victoria crape.

CRASH, a technical textile term applied to a species of narrow towels, from 14 to 20 in. wide. The name is probably of Russian origin, the simplest and coarsest type of the cloth being known as “Russia crash.” The latter is made from grey flax or tow yarns, and sometimes from boiled yarns. The simple term “crash” is given to all these narrow cloths, but the above distinction is very convenient, as also are the following: grey, boiled, bleached, plain, twilled and fancy crash. A large variety obtains with and without fancy borders, while of late years cotton has been introduced as warp, as well as mixed and jute yarns for weft. After the cloth has passed through all the finishing operations, it is cut up into lengths of about 3 yds., the two ends sewn together and it is then ready to be placed over a suspended roller; for this reason it is often termed “roller rolling.”

Crashaw, Richard (1613–1650), English poet, styled “the divine,” was born in London about 1613. He was the son of a strongly anti-papistical divine, Dr. William Crashaw (1572–1626), who distinguished himself, even in those times, by the excessive acerbity of his writings against the Catholics. In spite of these opinions, however, he was attracted by Catholic devotion, for he translated several Latin hymns of the Jesuits. Richard Crashaw was originally put to school at Charterhouse, but in July 1631 he was admitted to Pembroke College, Cambridge, where he took the degree of B.A. in 1634. The publication of Herbert’s Temple in 1633 seems to have finally determined the bias of his genius in favour of religious poetry, and next year he published his first book, Epigrannatium sacrorum lib., a Latin version. In March 1636 he removed to Peterhouse, was made a fellow of that college in 1637, and proceeded M.A. in 1638. It was about this time that he made the acquaintance and secured the lasting friendship of Abraham Cowley. He was also on terms of intimacy with the Anglican monk Nicholas Ferrar, and frequently visited him at his religious house at Little Gidding. In 1641 he is said to have gone to Oxford, but only for a short time; for when in 1643 Cowley left Cambridge to seek a refuge at Oxford, Crashaw remained behind, and was forcibly ejected from his fellowship in 1644. In the confusion of the civil wars he escaped to France, where he finally embraced the Catholic religion, towards which he had long been tending.

During his exile his religious and secular poems were collected by an anonymous friend, and published under the title of Steps to the Temple and The Delights of the Muse, in one volume, in 1646. The first part includes the hymn to St Teresa and the version of Marini’s Sospetto d’Ierode. This same year Cowley found him in great destitution at Paris, and induced Queen Henrietta Maria to extend towards him what influence she still possessed. At her introduction he proceeded to Italy, where he became attendant to Cardinal Palotta at Rome. In 1648 he published two Latin hymns at Paris. He remained until 1649 in the service of the cardinal, to whom he had a great personal attachment; but his retinue contained persons whose violent and licentious behaviour was a source of ceaseless vexation to the sensitive English mystic. At last his denunciation of their excesses became so public that the animosity of those persons was excited against him, and in order to shield him from their revenge he was sent by the cardinal in 1650 to Loretto, where he was made a canon of the Holy House. In less than three weeks, however, he sickened of fever, and died on the 25th of August, not without grave suspicion of having been poisoned. He was buried in the Lady chapel at Loretto. A collection of his religious poems, entitled Carmen Deo nostro, was brought out in Paris in 1652, dedicated at the dead poet’s desire to the faithful friend of his sufferings, the countess of Denbigh. The book is illustrated by thirteen engravings after Crashaw’s own designs.

Crashaw excelled in all manner of graceful accomplishments; besides being an excellent Latinist and Hellenist, he had an intimate knowledge of Italian and Spanish; and his skill in music, painting and engraving was no less admired in his lifetime than his skill in poetry. Cowley embalmed his memory in an elegy that ranks among the very finest in our language, in which he, a Protestant, well expressed the feeling left on the minds of contemporaries by the character of the young Catholic poet:

*His faith, perhaps, in some nice tenets might
be wrong; his life, I’m sure, was in the right:
And I, myself, a Catholic will be,
So far at least, dear saint, to pray to thee!*

The poetry of Crashaw will be best appreciated by those who can with most success free themselves from the bondage of a traditional
CRASSULACEAE—CRASSUS

CRASSULACEAE, in botany, a natural order of dicotyledons, containing 13 genera and nearly 500 species; of cosmopolitan distribution, but most strongly developed in South Africa. The plants are herbs or small shrubs, generally with thick fleshy stems and leaves, adapted for life in dry, especially rocky places. The fleshy leaves are often reduced to a more or less cylindrical structure, as in the stonecrops (Sedum), or form closely crowded rosettes as in the house-leek (Sempervivum). Correlated with their life in dry situations, the bulk of the tissue is succulent, forming a water-store, which is protected from loss by evaporation by a thickly cuticularized epidermis covered with a waxy secretion which gives a glaucous appearance to the plant. The flowers are generally arranged in terminal or axillary clusters, and are markedly regular with the same number of parts in each series. This number is, however, very variable, and often not constant in one and the same species. The sepals and petals are free or more or less united, the stamens many or twice as many as the petals; the carpels, usually free, are equal to the petals in number, and form in the fruit follicles with two or more seeds.

Opposite each carpel is a small scale which functions as a nectary. Means of vegetative propagation are general. Many species spread by means of a creeping much-branched rootstock, or as in house-leek, by runners which perish after producing a terminal leaf-rosette. In other cases small portions of the stem or leaves give rise to new plants by budding, as in Bryophyllum, where buds develop at the edges of the leaf and form new plants.

The order is almost absent from Australia and Polynesia, and has but few representatives in South America; it is otherwise very generally distributed. The largest genus, Sedum, contains about 140 species in the temperate and colder parts of the northern hemisphere; eight occur wild in Britain, including S. Telephium (orpine) and S. acre (common stonecrop) (see fig.). The species are easily cultivated and will thrive in almost any soil. They are readily propagated by seeds, cuttings or divisions. Crassula has about 100 species, chiefly at the Cape. Cotyledon, a widely distributed genus with about 90 species, is represented in the British Isles by C. Umbilicus, pennywort, or navelwort, which takes its name from the succulent peltate leaves. It grows profusely on dry rocks and walls, especially on the western coasts, and bears a spike of drooping greenish cup-shaped flowers. The Echeveria of gardeners and florists, is closely related to this genus. Sempervivum has about 50 species in the mountains of central and southern Europe, in the Himalayas, Abyssinia, and the Canaries and Madeira; S. tectorum, common house-leek, is seen often growing on tops of walls and house-roofs. The hardy species will grow well in dry sandy soil, and are suitable for rockeries, old walls or edgings. They are readily propagated by offsets or by seed.

The order is closely allied to Saxifragaceae, from which it is distinguished by its fleshy habit and the larger number of carpels.

CRASSUS (literally "dense," "thick," "fat"), a family name in the Roman gens Licinia (plebeian). The most important of the name are the following:

1. Publius Licinius Crassus, surnamed Dives Macianus, Roman statesman, orator and jurist, consul, 131 B.C. He was the son of P. Mucius Scaevola (consul 175) and was adopted by a P. Licinius Crassus Dives. An intimate friend of Tiberius Gracchus, he was chosen after his death to take his place on the agrarian commission (see Gracchus). In 137 when Crassus was consul with L. Valerius Flaccus, Aristonicus, an illegitimate son of Eumenes II. of Pergamum, laid claim to the kingdom, which had been bequeathed by Attalus III. to Rome. Both consuls were anxious to obtain the command against him; Crassus was pontifex maximus, and Flaccus a flamen of Mars. Crassus declared that Flaccus could not neglect his sacred office, and imposed a conditional fine on him in the event of his leaving Rome. The popular assembly remitted the fine, but Flaccus was ordered to obey the pontifex maximus. Crassus accordingly proceeded to Asia, although in doing so he violated the rule which forbade the pontifex maximus to leave Italy. Nothing is known of his military operations. But in the following year, when he was making preparations to return, he was surprised near Leuciae. He was himself taken prisoner by a Thracian band, and provoked his captors, who were ignorant of his identity, to put him to death. Crassus does not seem to have possessed much military ability, but he was greatly distinguished for his knowledge of law and his accomplished oratory. He had acquired such a mastery of the Greek language that, when he presided over the courts in Asia, he was able to answer each suitor in ordinary Greek or any of the dialects in use.

Cicero, De oratore, i. 50; Philop. xi. 8; Plutarch, Tib. Gracchus, 21; Livy, Epit. 59; Val. Max. iii. 12. 7, 6; Vell. Pat. ii. 4; Justin xxxvi. 4; Orosius v. 10.

2. Lucius Licinius Crassus (140-91 B.C.), the orator, of unknown parentage. At the age of nineteen (or twenty-one) he made his reputation by a speech against C. Papirius Carbo, the friend of the Gracchi. The law passed by him and his colleague Q. Mucius Scaevola during their consulship (95), to prevent those passing as Roman citizens who had no right to the title, was one of the prime causes of the Social War (Cicero, Pro Balbo, xxii., De officis, iii. 11). During his censorship Crassus suppressed the newly founded schools of Latin rhetoricians (Aulus Gallius

Stonecrop (Sedum acre) slightly reduced. 1. Horizontal plan of arrangement of flower of stonecrop; 2. flower of Sedum rubens.
CRATER—CRATINUS

381

CRATES, the name of two Greek philosophers.
1. Crates, of Athens, successor of Polemo as leader of the Old Academy.
2. Crates, of Thebes, a Cynic philosopher of the latter half of the 4th century. He was the famous pupil of Diogenes, and the last great representative of Cynicism. It is said that he lost his ample fortune owing to the Macedonian invasion, but a more probable theory is that he, in accordance with his principles, directing the banker, to whom he entrusted it, to give it to his sons if they should prove fools, but to the poor if his sons should prove philosophers. He gave up his life to the attainment of virtue and the propagation of ascetic self-control. His habit of entering houses for this purpose, uninvited, earned him the nickname Θυρεανάρχης ("Door-opener"). His marriage with Hipparchia, daughter of a wealthy Thracian family, was in curious contrast to the prosaic character of his life. Attracted by the nobility of his character and undeterred by his poverty and ugliness, she insisted on becoming his wife in defiance of her father's commands. The date of his death is unknown, though he seems to have lived into the 3rd century. His writings were few. According to Diogenes Laërtius, he was the author of a number of letters on philosophical subjects; but those extant under the name of Crates (R. Hercher, Epistolographi Graeci, 1873) are, spurious, the work of later rhetoricians. Diogenes Laërtius credits him with a short poem, Παραχάωμα, and several philosophic tragedies. Plutarch's life of Crates is lost. The great importance of Crates' work is that he formed the link between Cynicism and the Stoics, Zeno of Citium being his pupil.

See C. Wachsmuth, De Cratete Cynico (1862); F. Mullach, Frag. Philosopherum Graecorum, ii. (1867); E. Wellmann, Die Allgemeine Enzyklopädie, § Diog. Laer. vii. 86-93, 96-98.

CRATINUS, of Mallus in Cilicia, a Greek grammarian and Stoic philosopher of the 2nd century B.C., leader of the literary school and head of the library of Pergamum. His principles were opposed to those of Aristarchus, the leader of the Alexandrian school. He was the chief representative of the allegorical theory of exegesis, and maintained that Homer intended to express scientific or philosophical truths in the form of poetry. About 170 B.C. he visited Rome as ambassador of Attalus II., king of Pergamum; and having broken his leg and been compelled to stay there for some time, he delivered lectures which gave the first impulse to the study of grammar and criticism among the Romans (Suetonius, De grammaticis, 2). His chief work was a critical and exegetical commentary on Homer.

See C. Wachsmuth, De Cratete Malloto (1860), containing an account of the life, pupils and writings of Crates; J. E. Sandys, Hist. of Class. Schol. i. 156 (ed. 2, 1906).

CRATES, Athenian comic poet, chief representative of the old, moral, or political school. Hardly anything is known of his life, and only fragments of his works have been preserved. But a good idea of their character can be gained from the opinions of his contemporaries, especially Aristophanes. His comedies were chiefly distinguished by their direct and vigorous political satire, a marked exception being the burlesque Οδοξεια, dealing with the story of Odysseus in the cave of Polyphemus, probably written while a law was in force forbidding all political references on the stage. They were also remarkable for the absence of the parabasis and chorus. Persius calls the author "the bold," and even Péricles at the height of his power did not escape his vehement attacks, as in the Nemesis and Archilochi, the last-named a lament for the loss of the recently deceased Cicom, with whose conservative sentiments Cratinus was in sympathy. The Panoptae was a satire on the sophists and omniscient speculative philosophers of the day. Of his last comedy the plot has come down to us. It was occasioned by the sneers of Aristophanes and others, who declared that he was no better than a doting drunkard. Roused by the taunt, Cratinus put forth all his strength, and in 435 B.C. produced the Panaepi,
or *Bottle*, which gained the first prize over the *Clouds* of Aristophanes. In this comedy, good-humouredly making fun of his own weakness, Cratippus represents the comic muse as the faithful wife of his youth. His guilty fondness for a rival—the bottle—has aroused her jealousy. She demands a divorce from the archon; but her husband's love is not dead and he returns penitent to her side. In Grenfell and Hunt's *Oxyrhynchus Papyri*, vol. iv. (1904), containing a further instalment of their edition of the Behnesa papyri discovered by them in 1866–1867, one of the greatest curiosities is a scrap of paper bearing the argument of a play by Cratippus,—the *Dionysalexandros* (i.e., Dionysus in the part of Paris), aimed against Pericles; and the epitome reveals something of its wit and point. The style of Cratippus has been likened to that of Aeschylus; and Aristophanes, in the *Knights*, compares him to a rushing torrent. He appears to have been fond of lofty diction and bold figures, and was most successful in the lyrical parts of his dramas, his choruses being the popular festal songs of his day. According to the statement of a doubtful authority, which is not borne out by Aristotle, Cratippus increased the number of actors in comedy to three. He wrote 27 comedies.

Fragments in Meincke, *Fragmenta Comicaorum Graecorum*, or Kock, *Comitiorum Atticorum fragmenta*. A younger Cratippus flourished in the time of Alexander the Great. It is considered that some of the comedies ascribed to the elder Cratippus were really the work of the younger.

**CRATIPPOS** (fl. c. 375 B.C.), Greek historian. There are only three or four references to him in ancient literature, and his importance is due to the fact that he has been identified by several scholars (e.g. Blasis) with the author of the historical fragment discovered by Grenfell and Hunt, and published by them in *Oxyrhynchus Papyri*, vol. iv. It may be regarded as a fairly certain inference from *a* passage in Plutarch (De *Glorio Atheneivm*, p. 345 E, ed. Bernardakis, ii. p. 455) that he was an Athenian writer, intermediate in date between Thucydides and Xenophon, and that his work continued the narrative of Thucydides, from the point at which the latter historian stopped (410 B.C.) down to the battle of Cnidus (394 B.C.).

The fragments are published in C. Müller's *Fragmenta Historicon Graecorum*. For authorities see under *Theopompus*.

**CRATIPPOS**, of Mitylene (1st century B.C.), Periapatetic philosopher, contemporary with Cicero, whose son he taught at Athens, and by whom he is praised in the *De officiis* as the greatest of his school. He was the friend of Pompey also and shared his flight after the battle of Pharsalia, for the purpose, it is said, of convincing him of the justice of providence. Brutus, while at Athens after the assassination of Caesar, attended his lectures. The freedom of Rome was conferred upon him by Caesar, at the request of Cicero. The only work attributed to him is a treatise on divination, but his reputation may be gauged by the fact that in 44 B.C. the Athenians invited him to succeed Andronicus of Rhodes as scholar. He seems to have held that, while motion, sense and appetite cannot exist apart from the body, thought reaches its greatest power when most free from bodily influence, and that divination is due to the direct action of the divine mind on that faculty of the human soul which is not dependent on the body.

Cicero, *De divinatione*, i. 3, 32, 50, li. 48, 52; *De officiis*, i. 1, iii. 2; Plutarch, *Ciceron*, 24.

**CRAU** (from a Celtic root meaning “stone”), a region of southern France, gained in the department of Bouches-du-Rhône, and bounded W. by the canal from Arles to Port-du-Bouc and the Rhone, N. by the chain of the Alpes separating it from an analogous region, the Petite Crau, E. by the hills around Salon and Istres, S. by the gulf of Fos, an inlet of the Mediterranean Sea. Covering an area of about 200 sq. m., the Crau is a low-lying, waterless plain, owing its formation to a sudden inundation, according to some authorities, of the Rhone and the Durance, according to others of the Durance alone. Its surface is formed chiefly of stones varying in size from an egg to a man's head; these, mixed with a proportion of fine soil, overlies a subsoil formed of stones cemented into a hard mass by deposits of calcareous sand, beneath which lies a bed of loose stones, once the

*CRATIPPOS—CRAUFURD*

Naturally sterile and poor in lime, the Crau is adapted for agriculture by the process of warping, carried out by means of the Canal de Craponne (a part of which dates from the middle of the 16th century; about one-quarter of the region in the north and east has thus been covered by the rich deposits of the waters of the Durance. The soil also responds in places to deep cultivation and the application of artificial manures. By these aids, uncultivated land, which before supplied only rough and scanty pasture for a few sheep, has been fitted for the growth of the vine, olive and other fruits; where irrigation is practicable, watermeadows have been formed. The dryness of the climate is unfavourable to the production of cereals.

**CRAU** *CRAU**, (1787–1808), French sculptor, was born and died at Valenciennes, where a special museum for his works was erected in his honour. Though little known to the world at large during his long life, he ranks among the best modern sculptors of France. At Paris his "Colony " monument is in the rue de Rivoli; his " Victory " in the Place des Arts et Métiers; and "Twilight" in the Avenue de l’Observatoire. Among his finest works is his "Combat du Centaure," on which he was engaged for three years, the figure of the Lapith having been modelled after the athlete, Eugene Sandow. An exhibition of his works was held in the École des Beaux-Arts.

**CRAUFURD, QUINTIN** (1743–1810), British author, was born at Kilwinock on the 22nd of September 1743. In early life he went to India, where he entered the service of the East India Company. Returning to Europe before the age of forty with a handsome fortune, he settled in Paris, where he gave himself to the cultivation of literature and art, and formed a good library and collection of paintings, coins and other objects of antiquarian interest. Craufurd was on intimate terms with the French court, especially with Marie Antoinette, and was one of those who ranged the flight to Varennes. He escaped to Brussels, but in 1792 he returned to Paris in the hope of rescuing the royal prisoners. He lived among the French émigrés until the peace of Amiens made it possible to return to Paris. Through Talleyrand's influence he was able to remain in Paris after the war was resumed, and he died there on the 23rd of November 1819.

**CRAUFURD, ROBERT** (1764–1812), British major-general, was born at Newark, Ayrshire, on the 5th of May 1764, and entered the 25th Foot in 1779. As captain in the 7th regiment he first saw active service against Tipppo Sahib in 1790–92. The next year he was employed, under his brother Charles, with the Austrian armies operating against the French. Returning to England in 1797, he soon saw further service, as a lieutenant-colonel, on Lake's staff in the Irish rebellion. A year later he was British commissioner on Suvarov's staff when the Russians invaded Switzerland, and at the end of 1799 was in the Helder expedition. From 1801 to 1803 Lieutenant-Colonel Craufurd sat in parliament for East Retford, but in 1807 he resumed active service with Whitehead in the unfortunate Buenos Aires expedition. He was almost the only one of the senior officers who added to his reputation in this affair, and in 1808 he received a brigade under Sir John Moore. His regiments were heavily engaged in the earlier part of the Peninsular war, but were not present at Corunna, having been detached to Vigo. When they returned to England. Later in 1809, once more in the Peninsula, Brigadier-General Craufurd was three marches or more in rear of Wellesley's army when a report came in that a great battle was in progress. The march which followed is one almost unparalleled in military annals. The three battalions of the "Light Brigade" (43rd, 52nd and 95th) started in full marching order, and arrived at the front on the day after the battle of Talavera, having covered 62 m. in twenty-six hours. Beginning their career with this famous march, these regiments and their
CHIEF, under whom served such men as Charles and William Napier, Shaw and Colborne, soon became celebrated as one of the best corps of troops in Europe, and every engagement added to their laurels. Craufurd's operations on the Coa and Agueda in 1810 were daring to the point of rashness, but he knew the quality of the men he led better than his critics did, and though Wellington censured him for his conduct, he at the same time increased his force to a division by the addition of two picked regiments of Portuguese Caçadores. The conduct of the renowned "Light Division" at Busaco is described by Napier in one of his most vivid passages. The winter of 1810–1811 Craufurd spent in England, and his division was commanded in the interim by another officer, who did not display much ability. He reappeared on the field of the battle of Fuentes d'Onoro amidst the cheers of his men, and nothing could show his genius for war better than his conduct on this day, in covering the strange readjustment of his line which Wellington was compelled to make in the face of the enemy. A little later he obtained major-general's rank and on the 10th of January 1812, as he stood on the glacis of Ciudad Rodrigo, directing the stormers of the Light Division, he fell mortally wounded. His body was carried out of action by his staff officer, Lieutenant Shaw of the 43rd (see Shaw Kennedy), and, after lingering four days, he died. He was buried in the breach of the fortress where he had met his death, and a monument in St Paul's cathedral commemorates Craufurd and Mackinnon, the two generals killed at the storming of Ciudad Rodrigo. The exploits of Craufurd and the Light Division are amongst the most cherished traditions of the British and Portuguese armies. One of the quickest and most brilliant, if not the very first, of Wellington's generals, he had a fiery temper, which rendered him a difficult man to deal with, but to the day of his death he possessed the confidence and affection of his men in an extraordinary degree.

His elder brother, Lieutenant-General Sir Charles Craufurd (1761–1821), entered the 1st Dragoon Guards in 1778. Made captain in the Queen's Bays in 1785, he became the equerry and intimate friend of the duke of York. He studied in Germany for some time, and, with his brother Robert's assistance, translated Tielck's book on the Seven Years' War (7th Remarkable Events of the War between Prussia, Austria and Russia, from 1756 to 1763). As aide-de-camp he accompanied the duke of York to the French War in 1793, and was at once sent as commissioner to the Austrian headquarters, with which he was present at Neerwinden, Caesar's Camp, Famars, Landrecies, &c. Major in 1793, and lieutenant-colonel in 1794, he returned to the English army in the latter year, and on one occasion distinguished himself at the head of two squadrons, taking 3 guns and 1000 prisoners. When the British army left the continent, Craufurd was again attached to the Austrian army, and was present at the actions on the Lahn, the combat of Neumarkt, and the battle of Amberg. At the last battle a severe wound rendered him incapable of further service, and cut short a promising career. He succeeded his brother Robert as member of parliament for East Retford (1806–1812). He died in 1821, having become a lieutenant-general and a G.C.B.

CRAVAT (from the Fr. cravate, a corruption of "Croat"), the name given by the French in the reign of Louis XIV. to the scarf worn by the Croatian soldiers enlisted in the royal Croatian regiment. Made of linen or muslin with broad edges of lace, it became fashionable, and the name was applied both in England and France to various forms of neckerchief worn at different times, from the loosely tied lace cravat with long flowing ends, called a "Steinkirk" from the battle of 1609 of that name, to the elaborately folded and lightly starched linen or cambric neckcloth worn during the period of Beau Brummell.

CRAVEN, PAULINE MARIE ARMANDE AGLAÉ (1808–1891), French author, the daughter of an emigré Breton nobleman, was born in London on the 12th of April 1808. Her father, the comte Auguste de la Ferronays, was a close friend of the duc de Berri, whom he accompanied on his return to France in 1814. He and his wife were attached to the court of Charles X. at the Tuileries, but a momentary quarrel with the duc de Berri made retirement imperative to the court's sense of honour. He was appointed ambassador at St Petersburg, and in 1827 became foreign minister in Paris. Pauline was thus brought up in brilliant surroundings, but her strongest impressions were those which she derived from the group of Catholic thinkers gathered round Lamennais, and her ardent piety furnishes the key of her life. In 1828 her father was sent to Rome, and Pauline, at the suggestion of Alexis Rio, the art critic, made her first literary essay with a description of the emotions she experienced on a visit to the catacombs. At the revolution of July, M. de la Ferronays resigned his position, and retired with his family to Naples. Here Pauline met her future husband, Augustus Craven, who was then attached to the British embassy. His father, Keppel Richard Craven, the well-known supporter of Queen Caroline, objected to his son's marriage with a Catholic; but his scruples were overcome, and immediately after the marriage (1834) Augustus Craven was received into the Roman Catholic Church. Mrs Craven, whose family life as revealed in the Récit d'une seur was especially tender and intimate, suffered several severe bereavements in the years following her marriage. In 1841, when the death of Keppel Craven made his son practically indigent, he entered his diplomatic career, in which he had not been conspicuously successful. He stood unsuccessfully for election to parliament for Dublin in 1852, and from that time retired into private life. They went to live at Naples in 1853, and Mrs Craven began to write the history of the family life of the la Ferronays between 1830 and 1836, its incidents being grouped round the love story of her brother Albert and his wife Alexandre. This book, the Récit d'une seur (1866, Eng. trans. 1868), was enthusiastically received and was awarded a prize by the French Academy. Straitened circumstances made it desirable for Mrs Craven to earn money by her pen. Anne Sevrin appeared in 1868, Fleurançe in 1871, Le Mot d'émigre in 1874, Le Vabriant (Eng. trans., Lucia) in 1886. Among her miscellaneous works may be mentioned La Sœur Natale Narsichkin (1876), Deux Incidents de la question catholique en Angleterre (1873), Lady Georgiana Fullerton, sa vie et ses œuvres (1888). Mrs Craven's charming personality won many friends. She was a frequent guest with Lord Palmerston, Lord Ellesmere and Lord Granville. She died in Paris on the 1st of April 1891. Her husband, who died in 1884, translated the correspondence of Lord Palmerston and of the Prince Consort into French.

See Memoir of Mrs Augustus Craven (1894), by her friend Mrs Mary Catherine Bishop; also Paolina Craven, by T.F. Ravaschieri Fieschi (1892). There is a biography of Mrs Craven's father, "Emigration," in Ettiene Lamy's "Temoins des jours passés" (1907).

CRAVEN, WILLIAM CRAVEN, EARL OF (1608–1677), eldest son of Sir William Craven, lord mayor of London, and of Elizabeth, daughter of Alderman William Whitemore, was born in June 1608, matriculated at Trinity College, Oxford, in 1623, and joined the society of the Middle Temple in 1624. He had already inherited his father's vast fortune by the latter's death in 1628, and before he came of age he had distinguished himself in the military service of the princes of Orange. Returning home he was knighted and created Baron Craven of Hampstead Marshall in Berkshire in 1627. He early showed enthusiasm for the cause of the unhappy French king and queen of Bohemia, driven from their domains, and in 1650, with Frederick in a military expedition to recover the Palatinate, a "remarkable event," he married Philippa von Hochenau, whose praise he gained by being the first, though wounded, to mount the breach at the capture of Kreuznach on the 22nd of February. The Swedish king, however, refused to allow the elector an independent command for the defence of the Palatinate, and Craven returned to England. In May 1653 he was placed on the council of Wales. In 1657 he took part in a second expedition in aid of the palatine family on the Lower Rhine, with the young elector Charles Louis and his brother Rupert, and offered as a contribution the sum of £30,000, but their forces were defeated near Wessel and Craven wounded and taken prisoner together with Rupert. He purchased his freedom in 1659, and then joined the small court of the exiled queen.
CRAWFORD, EARLS OF

Elizabeth at the Hague and at Rhenen, supplying her generously with funds on the cessation of her English pension owing to the outbreak of the Civil War. He contributed also afterwards, in aid of Charles I., and, after his execution, of Charles II., the amount bestowed upon the latter being alone computed at £50,000, notwithstanding that since 1651 the greater part of his estates had been confiscated by the parliament and his house at Caversham reduced to ruins. At the Restoration he accompanied Charles to England, regained his estates, and was rewarded with offices and honours. He was made colonel of several regiments including the Coldstream, and in 1667 lieutenant-general, and also high steward of Cambridge University. In 1666 he became a privy councillor, but was not included later in 1679 in Sir William Temple's remodelled council. In 1668 he became a governor of the Charterhouse, was appointed lord-lieutenant of Middlesex, and master of the Trinity House in 1676; and in 1673 a commissioner for Tangier. He was one of the lords proprietors of Carolina and a member of the Fishery Committee.

In March 1664 he was created viscount and earl of Craven. Meanwhile his devotion to the interests of the queen of Bohemia was unceasing, and on her return to England he offered her hospitality at his house in Drury Lane, where she remained till February 1667. At his request (c. 1663) Pepys was appointed to bequeath to Crawford his papers and her valuable collection of portraits, but there is no foundation for the belief entertained later that she had married him. In 1668 he became the guardian of Ruperta, the natural daughter of his old comrade in arms, Prince Rupert. He was again made a privy councillor and lieutenant-general of the forces by James on his accession, and at the age of eighty was in command of the Coldstreams at Whitehall on the 17th of December 1668 when the Dutch troops arrived. He refused to withdraw them at the bidding of Count Solms, the Dutch commander, but obeyed later James's own orders to retire. His public career now closed and he filled no office after the revolution. Although his claims upon the gratitude of the Stuart royal family were immense, Craven had never been considered a possible candidate for high political place. His ability was probably small, and he is spoken of with little respect in the Verney Papers and by the electress Sophia in her Memoirs. The latter retains some foolish observations made by Craven, and Pepys was disgusted at his coarse and stupid jests at the Fishery Board, with which they were unacquainted. His military prowess, however, his generosity and his public spirit are undoubted. He showed great activity during the plague and fire of London. He was a patron of letters and a member of the Royal Society. He inherited Combe Abbey near Coventry from his father, and purchased Hampstead Marshall in Berkshire, where he built a house on the model of Heidelberg Castle.

He died unmarried on the 9th of April 1697, when the earldom became extinct, the barony passing by special remainder to his cousin William, 2nd Baron Craven; the present earl of Craven (the earldom being revived in 1801) is descended from John, a younger brother of the latter. The first Lord Craven's brother John, who was created Baron Craven of Ryton in Shropshire and who died in 1648, was the founder of the Craven scholarships at Oxford and Cambridge universities, of which the first was awarded in 1649.

CRAWFORD, EARLS OF. The house of Lindsay, of which the earl of Crawford is the head, traces its descent back to the barons of Crawford who flourished in the 13th century, and has included a number of men who have played leading parts in the history of Scotland. It is said that "though other families in Scotland may have been of more historic, none can in genealogical importance equal that of Lindsay," and the Lindsays claim that "the predecessors of the 1st earl of Crawford were barons at the period of the earliest parliamentary records, and that, in fact, they were never enrolled in the modern sense of the term, but were among the pares, of which kings are primi, from the commencement of recorded history." Again we are told, "the earldom of Crawford, therefore, like those of Douglas, of Moray, Ross, March and others of the earlier times of feudalism, formed a petty principality, an imperium in imperio." Moreover, the earls "had also a concilium, or petty parliament, consisting of the great vassals of the earldom, with whose advice they acted on great and important occasions."

Sir James Lindsay (d. 1396), 9th lord of Crawford in Lanarkshire, was the only son of Sir James Lindsay, the 8th lord (d. c. 1357), and was related to King Robert II.; he was descended from Sir Alexander Lindsay of Luffness (d. 1309), who obtained the barony of Lindsay and the earldom of Crawford from King David, who was high chamberlain of Scotland. The 9th lord fought at Otterburn, and Froissart tells of his wanderings after the fight. He was succeeded by his cousin, Sir David Lindsay (c. 1360-1407), son of Sir Alexander Lindsay of Glenesk (d. 1382), and in 1398 Sir David, who married a daughter of Robert II., was made earl of Crawford.

The most important of the early earls of Crawford are the 4th and the 5th earls. Alexander Lindsay, the 4th earl (d. 1454), called the "tiger earl," was, like his father David the 3rd earl, who was killed in 1446, one of the most powerful of the Scottish nobles; for some time he was in arms against King James II., but he submitted in 1452. His son David, the 5th earl (c. 1440-1495), was lord high admiral and lord chamberlain; he went frequently as an ambassador to England and was created duke of Montrose in 1488, but the title did not descend to his son. Montrose fought for James III. at the battle of Sauchieburn, and his son John, the 6th earl (d. 1533), was slain at Flodden. David Lindsay, 8th earl of Crawford (d. 1542), son of Alexander, the 7th earl (d. 1571), had a son Alexander, master of Crawford (d. 1542), called the "wicked master," who quarrelled with his father and tried to kill him. Consequently he was sentenced to death, and the 8th earl conveyed the earldom to his kinsman, David Lindsay of Edzell (d. 1558), a descendant of the 3rd earl of Crawford, thus excluding Alexander and his descendants, and in 1542 David became 9th earl of Crawford. But the 9th earl, although he had at least two sons, named the wicked master's son David as his heir, and consequently in 1558 the earldom came back to the elder line of the Lindsays, the 9th earl being called the "interpolated earl."

David Lindsay, 10th earl of Crawford (d. 1574), was a supporter of Mary Queen of Scots; he was succeeded by his son David (c. 1547-1607) as 11th earl. This David, a grandson of Cardinal Beaton, was concerned in some of the risings under James VI.; he was converted to Roman Catholicism and was in communication with the Spaniards about an invasion of England. After his death the earldom passed to his son David (d. 1621), a lawless ruffian, and then to his brother, Sir Henry Lindsay or Charteris (d. 1623), who became 15th earl of Crawford. Sir Henry's three sons became in turn earls of Crawford, the youngest, Ludovic, succeeding in 1639, and in 1640 the 16th earl was created 1st Duke of Richmond and Lennox.

Ludovic Lindsay, 16th earl of Crawford (1600-1652), took part in the strange plot of 1641 called the "incident." Having joined Charles I. at Nottingham in 1642, he fought at Edgehill, at Newbury and elsewhere during the Civil War; in 1644, just after Marston Moor, the Scottish parliament declared he had forfeited his earldom, and, following the lines laid down when this was regranted in 1642, it was given to John Lindsay, 1st earl of Lindsay. Ludovic was taken prisoner at Newcastle in 1644 and was condemned to death, but the sentence was not carried out, and in 1645 he was released by Montrose, under whom he served until the surrender of the king at Newark. Later he was in...
Ireland and in Spain and he died probably in France in 1652. He left no issue.

The earl of Lindsay, who thus supplanted his kinsman, belonged to the family of Lindsay of the Byres, a branch of the Lisneys descended from Sir David Lindsay of Crawford (d. c. 1355), the grandfather of the 1st earl of Crawford. Sir David's descendant, Sir John Lindsay of the Byres (d. 1482), was created a lord of parliament as Lord Lindsay of the Byres in 1445, and his son David, the 2nd lord (d. 1490), fought for James III. at the battle of Sauchieburn. The most prominent member of this line was Patrick, 6th Lord Lindsay of the Byres (d. 1589), a son of John the 5th lord (d. 1563), who was a temperate member of the reforming party. Patrick was one of the first of the Scottish nobles to join the reformers, and he was also one of the most violent. He fought against the regent, Mary of Lorraine, and the French, and in 1582 during a temporary reconciliation he assisted Mary, queen of Scots, to crush the northern rebels at Carrichie in 1562, but again among the enemies of the queen he took part in the murder of David Rizzio and signed the bond against Bothwell, whom he wished to meet in single combat after the affair at Carberry Hill in 1565. Lindsay, who was a brother-in-law and ally of the regent Murray, carried Mary to Lochleven castle and obtained her signature to the deed of abdication; he fought against her at Langside, and after Murray's murder he was one of the chiefs of the party which supported the throne of James VI. In 1578, however, he was among those who tried to drive Morton from power, and in 1582 he helped to seize the persons of the king in the plot called the "raid of Ruthven," afterwards escaping to England. Lindsay had returned to Scotland when he died on the 11th of December 1589. His successor was his son, James the 7th lord (d. 1601).

Patrick's great-grandson, John Lindsay, 17th earl of Crawford and 1st earl of Crawford (c. 1598-1678), was the son of Robert Lindsay, 4th Lord Lindsay of the Byres, whom he succeeded as 10th lord in 1616. In 1633 he was created earl of Lindsay, and becoming a leader of the Covenanters he marched with the Scottish army into England in 1644 and was present at Marston Moor; in 1644 also he obtained the earldom of Crawford in the manner already mentioned. In the same year he became lord high treasurer of Scotland, and in 1645 president of the parliament. Having fought against Montrose at Kilsyth, the earl of Crawford-Lindsay, as he was called, changed sides, and in 1647 he signed the "engagement" for the release of Charles I., losing all his offices by the act of classes when his enemy, the marquess of Argyll, obtained the upper hand. After the defeat of the Scots at Dunbar, however, Crawford received a pardon in Scotland, in Scottish politics, but from 1651 to 1660 he was a prisoner in England. In 1661 he was restored to his former dignities, but his refusal to abjure the covenant compelled him to resign them two years later. His son, William, 18th earl of Crawford and 2nd earl of Lindsay (1644-1698), was, like his father, an ardent covenant; in 1690 he was president of the Convention parliament. Mr Andrew Lang says this earl was "very poor, very presbyterian, and his letters, almost alone among those of the statesmen of the period, are rich in the texts and untutored style of an older generation."

William's grandson, John Lindsay, 20th earl of Crawford and 4th earl of Lindsay (1702-1749), won a high reputation as a soldier. He held a command in the Russian army, seeing service against the Turk, and he also served against the same foe under Prince Eugene. Having returned to the English army he led the life-guard at Dettingen and distinguished himself at Fontenoy; later he served against France in the Netherlands. He left no sons when he died in December 1749, and his kinsman, George Crawford-Lindsay, 4th Viscount Garnock (c. 1723-1781), a descendant of the 17th earl, became 21st earl of Crawford and 5th earl of Lindsay. When George's son, George, the 22nd earl (1758-1808), died unmarried in January 1808, the earldoms of Crawford and Lindsay were separated, George's kinsman, David Lindsay (d. 1809), a descendant of the 4th Lord Lindsay of the Byres, becoming 7th earl of Lindsay. Both David and his successor Patrick (d. 1839) died without sons, and in 1858 the House of Lords decided that Sir John Trotter Bethune, Bart. (1827-1894), also a descendant of the 4th Lord Lindsay of the Byres, was entitled to the earldom. In 1894 John's cousin, David Clark Bethune (b. 1832), became 11th earl of Lindsay.

The earldom of Crawford remained dormant from 1808, when this separation took place, until 1848, when the House of Lords adjudged it to James Lindsay, 7th earl of Balcarres.

The earls of Balcarres are descended from John Lindsay, Lord Menmuir (1532-1598), a younger son of David Lindsay, 9th earl of Crawford. John, who bought the estate of Balcarres in Fife, became a lord of session as Lord Menmuir in 1581; he was a member of the Scottish privy council and one of the commissioners of the treasury called the Octavians. He had great influence with James VI., helping the king to restore episcopacy after he had become, in 1595, keeper of the privy seal and a secretary of state. Menmuir, a man of great intellectual attainments, left two sons, the younger, David, succeeding to the family estates on his brother's death in 1601. David (c. 1586-1641), a notable alchemist, was created Lord Lindsay of Balcarres in 1633, and in 1651 his son Alexander was made earl of Balcarres.

Alexander Lindsay, 1st earl of Balcarres (1618-1659), the "Ruper of the Covenant," fought against Charles I. at Marston Moor, at Alford and at Kilsyth, but later he joined the royalists, signing the "engagement" for the release of the king in 1647, and having been created earl of Balcarres took part in Glencar's rising in 1653. Richard Baxter speaks very highly of the earl, who died at Breda in August 1659. His son Charles (d. 1662) became 2nd earl of Balcarres, and another son, Colin (c. 1654-1722), became 3rd earl. Colin, who was perhaps the most trusted of the advisers of James II., wrote some valuable Memoirs touching the Revolution in Scotland, 1688-1690; these were first published in 1714, and were edited for the Baronetcy Club by the 23rd earl of Crawford in 1841. Having been allowed to return to Scotland after an exile in France, the earl joined the Jacobite rising in 1715. His successor was his son Alexander, the 4th earl (d. 1736), who was followed by another son, James, the 5th earl (1691-1768), who fought for the Stuarts at Sheriffmuir. Afterwards James was pardoned and entered the English army, serving under George II. at Dettingen. This earl wrote some Memoirs of the Lindays, which were completed by his son Alexander, the 6th earl (1722-1825). Alexander was with the English troops in America during the struggle for independence, and was governor of Jamaica from 1794 to 1801, filling a difficult position with great credit to himself. He became a general in 1803, and died at Haigh Hall, near Wigan, which he had received as a gift from his father-in-law, Elizabeth Dalrymple (1759-1848), on 27th of May 1825. This earl did not claim the earldom of Crawford, although he became earl de jure in 1806, but in 1843 his son James Lindsay (1783-1869) did so, and in 1848 the claim was allowed by the House of Lords. James was thus 24th earl of Crawford and 7th earl of Balcarres; in 1826 he had been created a peer of the United Kingdom as Baron Wigan of Haigh Hall.

His son, Alexander William Crawford Lindsay, 25th earl of Crawford (1812-1880), was born at Muncaster Castle, Cumberland, on the 16th of October 1812, and educated at Eton and Cambridge. He travelled much in Europe and the East, and was most learned in genealogy and history. His more important works include Lives of the Lindays (3 vols., 1840), Letters on Egypt, Edom and the Holy Land (1848), Sketches of the History of Christian Art (1847 and 1892), Etruscan Inscriptions Analyzed (1872), and The Earlom of Mar during 500 years (1882). He succeeded to the title in September 1860, and died at Florence on the 13th of December 1880. A year later it was discovered that the family vault at Dunedoch had been broken into and the body stolen. It was not until the 18th of July 1882 that the police, acting on the confession of an eye-witness of the desecration, found the remains, which were then reinterred at Haigh Hall, Wigan.

His only son, James Ludovic Lindsay, 26th earl of Crawford (1847— ), British astronomer and orientalist, was born at St Germain-en-Laye, France, on the 28th of July 1847. Educated at Eton and Trinity College, Cambridge, he devoted himself to
astronomy, in which he early achieved distinction. In 1870 he went to Cadiz to observe the eclipse of the sun, and, in 1874, to Mauritius to observe the transit of Venus. In the interval, with the assistance of his father, he had built an observatory at Newtyle, Aberdeenshire, which in 1888 he presented, together with his unique library of astronomical and mathematical works, to the New Royal Observatory on Blackford Hill, Edinburgh, where they were installed in 1895. His services to science were recognized by his election to the presidency of the Royal Astronomical Society in 1877 and in 1879 in succession to Sir William Huggins, and to the fellowship of the Royal Society in 1878. He also received the degree of L.L.D. from Edinburgh University in 1882, and in the following year was nominated honorary associate of the Royal Prussian Academy of Sciences. An enthusiastic bibliophile, he became a trustee of the British Museum, and acted for a term as president of the Library Association. To the free library of Wigan, Lancashire, he gave a series of oriental and English MSS. of the 9th to the 10th centuries in illustration of the progress of handwriting, which for the use of students and art students he issued the invaluable Bibliotheca Lindesiana. He represented Wigan in the House of Commons from 1872 till his succession to the title in 1880.

Another title held by the Lindseys was that of Spynie, Sir Alexander Lindsay (c. 1555-1607), created Baron Spynie in 1590, being a younger son of the 10th earl of Crawford. The 2nd Lord Spynie was Alexander’s son, Alexander (d. 1646), who served in Germany under Gustavus Adolphus and assisted Charles I. in Scotland during the Civil War; and the 3rd lord was the latter’s son, George. When George, a royalist who was taken prisoner at the battle of Worcester, died in 1677 this title became extinct.

The dukedom of Montrose, which had lapsed on the death of the 3rd earl of Crawford in 1495 and had been revived in 1709 in the Graham family, was claimed in 1648 by the 24th earl of Crawford, but in 1853 the House of Lords gave judgment against the earl.

The Lindseys have furnished the Scottish church with several prelates. John Lindsay (d. 1353) was bishop of Glasgow; Alexander Lindsay (d. 1639) was bishop of Dunkeld until he was deposed in 1638; David Lindsay (d. c. 1641) was bishop of Brechin and then of Edinburgh until he, too, was deposed in 1638; and a similar fate attended Patrick Lindsay (1566-1644), bishop of Ross from 1613 to 1613 and archbishop of Glasgow from 1633 to 1638. Perhaps the most famous of the Lindsay prelates was David Lindsay (d. 1531-1613), a nephew of the 9th earl of Crawford. David, who married James VI. to Anne of Denmark at Upsala, was one of the leaders of the Kirk party; he became bishop of Ross under the new scheme for establishing episcopacy in 1600.

Fulkard, A Lindsay Record (1896); and Sir J. B. Paul’s edition of the Scots Peerage of Sir R. Douglas, vol. iii. (1906).

CRAWFORD, FRANCIS MARION (1834-1905), American author, was born at Bagoli di Lucca, Italy, on the 2nd of August 1834, being the son of the American sculptor Thomas Crawford (q.v.) and the former Julia Ward Howe, the American poet. He studied successively at St Paul’s school, Concord, New Hampshire; Cambridge University; Heidelberg; and Rome. In 1879 he went to India, where he studied Sanskrit and edited the Allahabad Indian Herald. Returning to America he continued to study Sanskrit at Harvard University for a year, contributed to various periodicals, and in 1882 produced his first novel, Mr Isaacs, a brilliant sketch of modern Anglo-Indian life mingled with a touch of Oriental mystery. This book had an immediate success, and its author’s promise was confirmed by the publication of Dr Claudius (1883). After a brief residence in New York and Boston, in 1883 he returned to Italy, where he made his permanent home. This accounts perhaps for the fact that, in spite of his nationality, Marion Crawford’s books stand apart from any distinctively American current in literature. Year by year he published a number of successful novels: Roman Singer (1884), An American Politician (1886), To Leeward (1888), Zorouz (1889), A Tale of a Lonely Parish (1886), Maris’s Crucifix (1887), Saracinesca (1887), Paul Patoff (1887), With the Immortals (1888), Greetenstein (1889), Sant’ Hario (1889), A Cigarette-maker’s Romance (1890), Kaled (1891), The Witch of Prague (1891), The Three Fates (1892), The Children of the King (1892), Don Orsino, 1891, Marian Durche (1893), Pietro Ghisleri (1893), Katharine Lauderdale (1894), Love in Idleness (1894), The Ralstonites, 1894, Casa Braccio (1895), Adam Johnston’s Son (1904), Rodaiza (1896), A Rose of Yesterday (1897), Corleonese (1897), Via Crucis (1898), Tn the Palace of the King (1900), Marietta (1900), Cecilia (1901), Whosoever Shall Offend (1904), Soprano (1905), A Lady of Rome (1906). He also published historical works, A Rome Immortals (1898), Rules of the South (1900)—renamed Sicily, Calabria and Malia in 1904,—and Gleanings from Venetian History (1905). In these he intimate knowledge of local Italian history combines with the romanticist’s imaginative faculty to excellent effect.

The groups of the pediment symbolize the progress of civilization in America. Crawford’s works include a large number of bas-reliefs of Scriptural subjects taken from both the Old and the New Testaments. He made Rome his home, but he visited several times his native land—first in 1844 (in which year he married Louisa Ward), next in 1849, and lastly in 1856. He died in London on the 10th of October 1857.

See Das Lincoln Monument, eine Rede des Senator Charles Summer, including that of Thomas Crawford (Frankfort a. M., 1868); Thomas Hicks, Eulogy on Thomas Crawford (New York, 1865).

CRAWFORD, WILLIAM HARRIS (1772-1834), American statesman, was born in Amherst county, Virginia, on the 24th of February 1772. When he was seven his parents moved to Edgefield district, South Carolina, and four years later into Columbus county, Georgia. The death of his father in 1785 left the family in reduced circumstances, and William made what he could by teaching school for six years. He then studied at Carmel Academy for two years, was principal, for a time, of one of the largest schools in Augusta, and in 1798 was admitted to the
bar. From 1800 to 1802, with Horatio Marbury, he prepared a
digest of the laws of Georgia from 1755 to 1800. From 1803 to
1807 he was a member of the State House of Representatives,
becoming during this period the leader of one of two personal-
political factions in the state that long continued in bitter
strife, occasioning his fighting two duels, in one of which he
killed his antagonist, and in the other was wounded in his wrist.
From 1807 to 1813 he was a member of the United States Senate,
of which he was president pro tempore from March 1812 to March
1813. In 1813 he declined the offer of the post of secretary of
war, but from that year until 1815 was minister to the court of
France. He was then secretary of war in 1815-1816, and
secretary of the treasury from 1816 to 1825. In 1816 in the
congressional caucus which nominated James Monroe for the
presidency Crawford was a strong opposing candidate, a
majority being at first in his favour, but when the vote was
finally cast 05 were for Monroe and 54 for Crawford. In 1824,
when the congressional caucus was fast becoming extinct,
Crawford, being prepared to control it, insisted that it should
be held, but of 216 Republicans only 66 attended; of these, 64
voted for Crawford. Three other candidates, however, Andrew
Jackson, Quincy Adams, and Henry Clay, were otherwise
put in the field. During the campaign Crawford was stricken
with paralysis, and when the electoral vote was cast Jackson
received 99, Adams 84, Crawford 41, and Clay 37. It
remained for the house of representatives to choose from Jackson, Adams
and Crawford, and through Clay’s influence Adams became
president. Crawford was invited by Adams to continue as
secretary of the treasury, but declined. He recovered his health
sufficiently to become (in 1827) a circuit judge in his own state,
but died while on circuit, in Elberton, Georgia, on the 15th of
September 1834. In his day he was undoubtedly one of the
foremost political leaders of the country, but his reputation has
not stood the test of time. He was of imposing presence and had
great conversational powers; but his inflexible integrity was not
sufficiently tempered by tact and civility to admit of his winning
general popularity. Consequently, although a skilful political
organizer, he incurred the bitter enmity of other leaders of his
time—Jackson, Adams and Calhoun. He won the admiration of
Albert Gallatin and others by his powerful support of the move-
ment in 1811 to recharter the Bank of the United States; he
earned the condemnation of posterity by his authorship in 1820 of
the four-years-term law, which limited the term of service of
thousands of public officials to four years, and did much to
develop the “spoils system.” He was a Liberal Democrat, and
advised the calling of a constitutional convention as preferable to
nullification or secession.

CRAWFORDSVILLE, a city and the county-seat of Mont-
gomery county, Indiana, U.S.A., situated about 40 m. N.W. of
Indianapolis. Pop. (1890) 6068; (1900) 6649, including 230
negroes and 221 foreign-born; (1910) 6371. It is served by the
Chicago, Indiana & Louisville, the Cleveland, Cincinnati,
Chicago & St. Louis, and the Vandalia railways, and by interurban
electric lines. Wabash College, founded here in 1832 by Presby-
terian missionaries but now non-sectarian, had in 1908 27
instructors, 345 students, and a library of 43,000 volumes.
Among the manufactures are flour, iron, wagons and carriages,
acetylene lights, wire and nails, matches, brick paving blocks, and
electrical machinery. North-east of the city there are valuable
mineral springs, from which the city obtains its water-supply.
Crawfordsville, named in honour of W. H. Crawford, was first
settled about 1820, was laid out as a town in 1823, and was
chartered as a city in 1863. It was for many years the home of
Gen. Lew Wallace.

CRAWFURD, JOHN (1783-1868), Scottish orientalist, was
born in the island of Islay, Scotland, on the 13th of August 1783.
After studying at Edinburgh University he became surgeon in the East India
Company’s service. He afterwards resided for some time at
Penang, and during the British occupation of Java from 1811 to
1817 his local knowledge made him invaluable to the government.
In 1821 he served as envoy to Siam and Cochín-China, and in
1825 became governor of Singapore. His last political service in
the East was a difficult mission to Burma in 1827. In 1861 he was
elected president of the Ethnological Society. He died at South
Kensington on the 5th of May 1868.

Crawfurde wrote a History of the Indian Archipelago (1820), De-
scriptive Dictionary of the Indian Islands and Adjacent Countries
(1856), Journal of an Embassy to the Court of Ava in 1827 (1829),
Journal of an Embassy to the Courts of Siam and Cochín-China,
evidencing a view of the actual State of those Kingdoms (1830), Inquiry into
the System of Taxation in India, Letters on the Interior of India, an
attack on the newspaper stamp-tax and the duty on paper entitled
Taxes on Knowledge (1836), and a valuable Malay grammar and
dictionary (1852).

CRAYER, GASPARD DE (1782-1860), Flemish painter, was
born at Antwerp, and learnt the art of painting from Raphaël
Cocxie. He matriculated in the guild of St Luke at Brussels in
1807, resided in the capital of Brabant till after 1860, and finally
settled at Ghent. Amongst the numerous pictures which he
painted in Ghent, one in the town museum represents the
martyrdom of St Blaise, and bears the inscription A. 1668 aet.
86. Crayer was one of the most productive yet one of the most
conscientious artists of the later Flemish school, second to
Rubens in vigour and below Vandyck in refinement, but nearly
equalling both in most of the essentials of painting. He was well
known and always well treated by Albert and Isabella, governors of
the Netherlands. The cardinal-infant Ferdinand made him a
court-painter. His pictures abound in the churches and museums
of Brussels and Ghent; and there is scarcely a country chapel in
Flanders or Brabant that cannot boast of one or more of his
 canvases. But he was equally respected beyond his native
country; and some important pictures of his composition are to
be found as far south as Aix in Provence and as far east as
Amberg in the Upper Palatinate. His skill as a decorative artist
is shown in the panels executed for a triumphal arch at the entry
of Cardinal Ferdinand into the Flemish capital, some of which
are publicly exhibited in the museum of Ghent. Crayer died at
Ghent. His best works are the “Miraculous Draught of Fishes”
in the gallery of Brussels, the “Judgment of Solomon” in the
gallery of Ghent, and “Madonnas with Saints” in the Louvre,
the Munich Pinakothek, and the Belvedere at Vienna. His portrait by Vandyck was engraved by P. Pontius.

CRAYFISH (Fr. crevissse), the name of freshwater crustaceans
closely allied to and resembling the lobsters, and, like them,
belonging to the order Macrura. They are divided into two
families, the Astacidae and Parastacidae, inhabiting respectively
the northern and the southern hemispheres.

The crayfishes of England and Ireland (Astacus, or Potamonius,
pallipes) are generally about 3 or 4 in. long, of a dull green or
brownish colour above and paler brown or yellowish below. They
are abundant in some rivers, especially where the rocks are of a
calcareous nature, sheltering under stones or in burrows which
they dig for themselves in the banks and coming out at night in
search of food. They are omnivorous feeders, killing and eating
insects, snails, frogs and other animals, and devouring any carrion
that comes in their way. It is stated that they sometimes come
on land in search of vegetable food.

On the continent of Europe, Astacus pallipes occurs chiefly in
the west and south, being found in France, Spain, Italy and the
Crayon—Crébillon

Balkan Peninsula. It is known in France as écrisse à pattes blanches and in Germany as Steinkrebs, and is little used as food. The larger Astacus fluviatilis (écrisse à patte rouge, Edelkrebs) is not found in Britain, but occurs in France and Germany, southern Sweden, Russia, &c. It is distinguished, among other characters, by the red colour of the under side of the large claws. It is the species most highly esteemed for the table. Other species of the genus are found in central and eastern Europe and as far east as Turkestan. Farther east a gap occurs in the distribution and no crayfishes are met with till the basin of the Amur is reached, where a group of species occurs, extending into northern Japan. In North America, west of the Rocky Mountains, the genus Astacus again appears, but east of the watershed it is replaced by the genus Cambarus, which is represented by very numerous species, ranging from the Great Lakes to Mexico. Several blind species inhabit the subterranean waters of caves. The best known is Cambarus pellucidus, found in the Mammoth Cave of Kentucky.

The area of distribution occupied by the southern crayfishes or Parastacidae is separated by a broad equatorial zone from that of the northern group, unless, as has been asserted, the two come into contact or overlap in Central America. None is found in any part of Africa, though a species occurs in Madagascar. They are absent also from the oriental region of zoologists, but reappear in Australia and New Zealand. Some of the Australian species, such as the "Murray River lobster" (Astacopsis spinifer), are of large size and are used for food. In South America crayfishes are found in southern Brazil, Argentina and Chile. (W. T. C. E.)

Crayon (Fr. côte, chalk, from Lat. cera), a coloured material for drawing, employed generally in the form of pencils, but sometimes also as a powder, and consisting of native earthy and stony friable substances, or of artificially prepared mixtures of a base of pipe or china clay with Prussian blue, orpiment, vermilion, and other pigments. Calcined gypsum, talc and compounds of magnesium, bismuth and lead are occasionally used as bases. The required shades of tints are obtained by adding varying amounts of colouring matter to equal quantities of the base. Crayons are used by the artist to make groupings of colours and to secure landscape and other effects with ease and rapidity. The outline as well as the rest of the picture is drawn in crayon. The colours are softened off and blended by the finger, with the assistance of a stump of leather or paper; and shading is produced by cross-hatching and stippling. The art of painting in crayon or pastel is supposed to have originated in Germany in the 17th century. By Johann Alexander Thiele (1685-1752) it was carried to great perfection, and in France it was early practised with much success. Amongst the earlier pastellists may be mentioned Rosalba Carriera (1657-1748), W. Hoare (1707-1792), F. Cotes (1725-1770), and J. Russell (1744-1806); and in recent years the art has been successfully revived. (See PASTEL.)

Cresy, Sir Edward Shepherd (1812-1878), English historian, was born at Bexley in Kent, and educated at Eton and King's College, Cambridge. He became a fellow of King's College in 1834, and having been called to the bar at Lincoln's Inn three years later, was made assistant judge at the Westminster sessions court. In 1840 he was appointed professor of modern and ancient history in the university of London, and in 1860 became chief justice of Ceylon and a knight. Broken down in health he returned to England in 1870, and after a further but short stay in Ceylon died in London on the 27th of January 1878. Cresy's most popular work is his Fifteen decisive Battles of the World, which, first published in 1865, was reissued in 1885 under the title of The History of the Ottoman Turks (London, 1854-1856); History of England (London, 1860-1870); Rise and Progress of the English Constitution (London, 1853, and other editions); Historical and Critical Account of the several Invasions of England (London, 1852); a novel entitled Old Love and the New (London, 1870); and various other works.

Cretanism and Traducianism. Traducianism is the doctrine that the soul which was taught by Tertullian in his De anima—that souls are generated from souls in the same way and at the same time as bodies from bodies: createdianism is the doctrine that God creates a soul for each body that is generated. The Pelagians taunted the Upholders of original sin with holding Tertullian's opinion, and called them Traduciani (from traduc-: vid. Du Cange s. w.), a name which was perhaps suggested by a metaphor in De an. 19, where the soul is described "velut surculus quidam ex matrice Adam in opipaginem deducta." Hence we have formed "traducianist," "traducianism," and by analogy "cretianist," "cretianism." Augustine denied that traducianism was necessarily connected with the doctrine of original sin, and to the end of his life was unwilling to decide for or against it. His letter to Jerome (Epist. Clas. iii. 166) is a most valuable statement of his difficulties. Jerome condemned it, and said that createdianism was the opinion of the Church, though he admitted that most of the Western Christians held traducianism. The question has never been authoritatively determined, but createdianism, which had always prevailed in the East, became the general opinion of the medieval theologians, and Peter Lombard's creando infundit animas Deus et infundendo creat was an accepted formula. Luther, like Augustine, was undecided, but Lutherans have as a rule been traducianists.

Calvin favoured createdianism. Peter Lombard's phrase perhaps shows that even in his time it was felt that some union of the two opinions was needed, and Augustine's tolerance pointed in the same direction, for createdianism he thought possible was one in which God operatur institutus administrando non nonos instituendo naturas (Ep. 166. s. 11). Modern psychologists teach that while "personality can be discerned in its 'becoming,' nothing is known of its origin; nor, however, may be taken as representing the believers in the immannence of the divine Being, puts forth—but as a "dim jecture"—something very like createdianism (Microcosm, bk. iii. chap. ad 38.). It is still, as in the days of Augustine, a question whether a more exact division of man into body, soul and spirit may help to throw light on this subject.

Crébillon, Prosper Jolyot de (1674-1743), French tragic poet, was born on the 13th of January 1743 at Dijon, where his father, Melchior Jolyot, was notary-royal. Having been educated at the Jesuits' school of the town, and at the Collège Mazarin, he became an advocate, and was placed in the parlement of Dijon at the age of 21. With the encourage-ment of his master, son of an old friend of Scarron's, he published a Morte des enfants de Brutes, which, however, he failed to bring upon the stage. But in 1705 he succeeded with Idoménée; in 1707 his Atrée et Thyeste was repeatedly acted at court; Electre appeared in 1709; and in 1711 he produced his finest play, the Rhodamiste et Zénobée, which is his masterpiece and held the stage for a long period, although the plot is so complicated as to be almost incomprehensible. But his Xerxes (1714) was only once played, and his Sémiramis (1717) was an absolute failure. In 1707 Crébillon had married a girl without fortune, who had since died, leaving him two young children. His father also had died, insolvent. His three years' attendance at court had been fruitless. Envy had circulated innumerable slanders against him. Oppressed with melancholy, he removed to a garret, where he surrounded himself with a number of dogs, cats and ravens, which he had befriend'd; he became utterly careless of cleanliness or food, and solaced himself with constant smoking. But in 1731, in a state of utter desolation, he was elected member of the Royal Academy; in 1733 he was elected to the French Academy; in 1745 the king presented him with a pension of 3000 francs, and in 1745 Mme de Pompadour presented him with a pension of 1000 francs and a post in the royal library. He returned to the stage in 1726 with a successful play, Pyrrhus; in 1748 his Catilina was played with great success before the court; and in 1745, when he was eighty years old, appeared his last tragedy, Le Triumvirat. Crébillon died on the 17th of June 1754. The enemies of Voltaire maintained that Crébillon was his superior as a tragic poet. The spirit of rivalry thus provoked induced Voltaire to take the subjects of no less than five of Crébillon's tragedies—Sémiramis, Electre, Catilina, Le Triumvirat, Atrée—as subjects for tragedies.
of his own. The so-called Éloge de Crébillon (1762), really a
depreciation, which appeared in the year of the poet's death, is
generally attributed to Voltaire, though he strenuously denied the
authorship. Crébillon's drama is marked by a force too often
gained at the expense of scenes of unnatural horror; his pieces
show lack of culture and a want of care which displays itself even in
the mechanism of his verse, though fine isolated passages are
not infrequent.

There are numerous editions of his works, among which may be noticed:
Œuvres (1772), with preface and "Éloge," by Joseph de la
Pore; Œuvres (1828), containing D'Alembert's Éloge de Crébillon (1775); and Théâtre complet (1885) with a notice by Auguste Viut. A complete bibliography is given by Maurice Dutrait, in his Étude sur la vie et le théâtre de Crébillon (1895).

His only son, Claude Prosper Jolyot Crébillon (1707–1777), French novelist, was born at Paris on the 14th of February 1707. His life was spent almost entirely in Paris, but the publication of L'Écumeur, ou Tanaë et Neadarne, histoire japonaise (1734), which contained veiled attacks on the bull Unigenitus, the cardinal de Rohan and the duchesse du Maine, brought Crébillon into disgrace. He was first imprisoned and afterwards forced to live in exile for five years at Sens and elsewhere. With Alexis Piron and Charles Collé he founded in 1752 the gay society which met regularly to dine at the famous "Caveau," where many good stories were elaborated. From 1750 onwards he was to be found at the Wednesday dinners of the Félibrige, to which Crébillon was at the time a frequent guest. He married in 1728 an English lady of noble family, Lady Henrietta Maria Stafford, who had been his mistress from 1744. Their life is said to have been passed in much affection and mutual fidelity; and there could be no greater contrast than that between Crébillon's private life and the tone of his novels, the immorality of which lent irony to the author's tenure of the office of censor, bestowed on him in 1739 through the favour of Mme de Pompadour. He died in Paris on the 12th of April 1777. The most famous of his numerous novels are: Les Amours de Zéokinazul, roi des Koïfrans (1740), in which "Zéokinazul" and "Koïfrans" may be translated Louis XIV, and the French respectively; and Le Sopha, conte moral (1740), where the moral is supplied in the title only. This last novel is given by some authorities as the reason for his imprisonment.

His Œuvres were collected and printed in 1772. See a notice of Crébillon's life and works prefixed to O. Lusanne's edition of his Contes d'ailleurs in the series of Contes du XVIIIe siècle. Crébillon's novels might be pronounced immoral to the last degree if it were not that two writers slightly later in date surpassed even his achievements in this particular. André Robert de Nerciat (1739–1800) produced under a false name a number of licentious tales, and was followed by Donatien, marquis de Sade.

CRÉCHE (Fr. for a "crib" or cradle), the name given to a
day-nursery, a public institution for the feeding and care of
infants while the mothers are engaged in work outside their
homes, or are otherwise prevented from giving them proper
attention. Infants are usually admitted when over a month old,
and are kept till they are capable of looking after themselves.
The advantages of such institutions are that the attention of
skilled and trained nurses is given to the children, the food is
better and more adapted to their needs than that given in their
homes, the surroundings are cleaner and healthier, and habits of
discipline and cleanliness are instilled, which, in many cases,
react on the mothers. The nurseries are usually under medical
supervision, and the small fees charged, which average in London
from 3d. to 4d. a day, and on the continent of Europe about 2d.,
are much less than the cost to the mother who places her young
children under the care of neighbours when at work or away from
home. Institutions of this kind were started in France in 1844,
and have been established in the majority of the large towns on
the continent of Europe. In the industrial centres of France and
Germany they have helped to check infantile mortality. The
state or municipality in nearly every case grants subsidies, but
few are maintained entirely by public authorities; voluntary
contributions are depended upon for the main support, and the
organization and management are left in the hands of private
societies and charitable institutions, although some outside
official supervision with regard to the number of infants
admitted to each institution, air-space, and ventilation and
general hygienic conditions is considered useful. In Great
Britain the establishment of such institutions has been almost
terribly to private initiative; and in comparison with the
continent the provision is inadequate and unsatisfactory, Paris
having nearly double the proportion of accommodation for
infants to the population that is provided in London. The
National Society of Day Nurseries was founded in 1901 for
the purpose of providing a bureau where information may be found
of good methods of founding and managing a crèche.

See the Report of the Consultative Committee upon the School
Attendance of Children below the Age of Five, issued by the Board of Education (1908).

CRÉCY (Cressy), a town of northern France, in the department
Somme, on the Maye, 12 m. N. by E. of Abbeville by road.
It is famous in history for the great victory gained here on the
26th of August 1346 by the English under Edward III. over the
French of King Philip of Valois. After its campaign in northern
France, the English army retired into Pontieu, and encamped on the 25th of August at Crécy, the French king in the meantime
marching from Abbeville on Braye. Early on the 26th Edward's army took up its position for battle, and Philip's, hearing of this,
moved to attack him, though the French army marched in much
disorder, and on arrival formed only an imperfect line of battle.
The English lay on the forward slope of a hillside, with their
right in front of the village of Crécy, their left resting on
Wadicourt. Two of the three divisions or "battles" were in first
line, that of the young prince of Wales (the Black Prince) on the
right, that of the earls of Northampton and Arundel on the left;
the third, under the king's own command, in reserve, and the
baggage was packed to the rear. Each battle consisted of a
centre of dismounted knights and men-at-arms, and two wings of
archers. The total force was 3900 men-at-arms, 11,000 English
archers, and 20,000 mercenary crossbowmen (Genoese), perhaps 20,000 of the milice des communes, besides a
certain number of foot of the feudal levy. Along with these served a Luxembourg contingent of horse under John, king of
Bohemia, and other fiefholders of the Holy Roman Empire, and
the whole force was probably about 60,000 strong.

The day was far advanced when the French came upon the
English position. Philip, near Estrées, decided to halt and bivouac, deferring the battle until the army was better closed up,
but the indiscipline of his army committed him to an immediate
action, and he ordered forward the Genoese crossbowmen, while
a line of men-at-arms deployed for battle behind them; the rest of
the army was still marching in an irregular column of route along
the road from Abbeville. A sudden thunderstorm caused a short
delay, then the archers and the crossbowmen opened the battle.
Here, for the first time in continental warfare, the English
CREDENCE—CRÉDIT FONCIER

long-bow proved its worth. After a brief contest the crossbows, completely outmatched, were driven back with enormous loss. Thereupon the first line of French knights behind them charged down upon the "faint-hearted rabble" of their own fugitives, and soon the first two lines of the French were a mere mob of horse and foot struggling with each other. The archers did not neglect the opportunity, and shot coolly and rapidly into the helpless target in front of them. The second attack was made by another large body of knights which had arrived, and served but to increase the number of the casualties, though here and there a few charged up to the English line and fell near it, among them the blind king of Bohemia, who with a party of devoted knights penetrated, and was killed amongst, the ranks of the prince of Wales's men-at-arms. The battle was now one long series of desperate but ill-conducted charges, a fresh onslaught being made as each new corps of troops appeared on the scene. The English archers on the flanks of the two first line battles had been wheeled up, the centres of dismounted men-at-arms held back, so that the whole line resembled a "herse" or harrow with three points formed by the archers (see sketch). Each successive body of the French sought to come to close quarters with the men-at-arms, and exposed themselves therefore at short range to the arrows on either flank. Under these circumstances there could be but one issue of the battle. Though sixteen distinct attacks were made and the fighting lasted until long after church, no impression was made on the English line. At one moment the prince was so far in danger that his barons sent to the king for aid. Even then Edward was not disquieted and he sent a mere handful of knights to the prince's battle, saying, "Let the boy win his spurs." The left battle of the English, hitherto somewhat to the rear, moved up into line with the prince, and the French attack slackened. By midnight the army of France was practically annihilated; 1542 men of gentle blood were left dead on the field and counted by Edward's heralds, the losses of the remainder are unknown. Some fifty of the victors fell in the battle. The story that the Black Prince adopted from the fallen king of Bohemia the crest and motto now borne by the princes of Wales lacks foundation (see John, King of Bohemia). A memorial to their French and their allies was erected, by public subscription in France, Luxemburg and Bohemia, in 1505.

CREDENCE, or CREDENCE TABLE, a small side-table, originally an article of furniture placed near the high table in royal or noble houses, at which the ceremony of the praegustatio, Italian credenzarei, the " assay " or tasting of food and drink for poisons was performed by an official of the household, the praegustator or credentarius as he was called in Medieval Latin. Both the ceremony and the table were known as credentia (Lat. credere, to believe, trust), Ital. credenza, Fr. crédence. After the need for the ceremony had disappeared the name still survived, and the table developed a back and several shelves for the display of plate, and gradually merged into the buffet (q.v.). It is, however, as an article of ecclesiastical furniture that the credence table is most familiar. It takes the form of a small table of wood or stone, sometimes fixed and sometimes merely a shelf above or near the piscina. It usually stands on the south or Epistle side of the altar, and on it are placed, in the Roman Catholic Church, the cruets containing the wine and water, the chalice, the candlesticks to be carried by the acolytes, and other objects to be used in the ceremony of the Mass. The use of such a table, to which earlier the name of paratorium or oblationarium was given, appears to have come into use when the personal presentation of the oblations at the Mass became obsolete. When the pope celebrates Mass a special credence table on the Gospel side of the altar is used, and the ceremony of tasting for poison in the unconsecrated elements is still observed. In some churches in England the old credence tables still exist, as at the church of St Cross near Winchester, where there is a fine stone 15th-century example; more frequent are examples of the stone shelf near the piscina. There are some carved wooden ones surviving, one type being with a semicircular top and three legs placed in a triangle with a lower shelf. The formal use of the credence table for the unconsecrated elements and the holy vessels before the celebration has been revived in the English Church.

CREDENTIALS (lettres de créance), a document which ambassadors, ministers plenipotentiary, and chargés d'affaires hand to the government to which they are accredited, for the purpose, chiefly, of communicating to the latter the envoy's diplomatic rank. It also contains a request that full credence be accorded to his official statements. Until his credentials have been presented and found in proper order, an envoy receives no official recognition. The credentials of an ambassador or minister plenipotentiary are signed by the chief of the state, those of a chargé d'affaires by the foreign minister.

CREDI, LORENZO DI (1459–1537), Italian artist, whose surname was Barducci, was born at Florence. He was the least gifted of three artists who began life as journeymen with Andrea del Verrocchio. Though he was the companion and friend of Leonardo da Vinci and Perugino, and closely allied in style to both, he had neither the genius of the one nor the facility of the other. We admire in Da Vinci's heads a heavenly contentment and smile, in his technical execution great gloss and smoothness of finish. Credi's faces disclose a smiling beatitude; his pigments have the polish of enamel. But Da Vinci imparted life to his creations, chased in the mirror of his own colours, and these are qualities which hardly existed in Credi. Perhaps he displayed a well-known form of tenderness in heads, moulded on the models of the old Umbrian school. Peculiarities of movement and attitude become stereotyped in his compositions; but when put on his mettle, he could still exhibit power, passion, pathos. Credi often repeated himself in Perugino's way; but being of a pious and resigned spirit, he generally embodied in his pictures a feeling which is yielding and gentle to the verge of coldness. Credi had a respectable local practice at Florence. He was consulted on most occasions when the opinion of his profession was required on public grounds, e.g. in 1491 as to the fronting, and in 1498 as to the lantern of the Florentine cathedral, in 1504 as to the place due to Michelangelo's "David." He never painted frescoes; at rare intervals only he produced large ecclesiastical pictures. The greater part of his time was spent on easel pieces, upon which he expended minute and patient labour. But he worked with such loathing that neither Credi nor Vasari was exist in European galleries. The best of his altarpieces is that which represents the Virgin and Child with Saints in the cathedral of Pistoia. A fine example of his eared rounds is in the gallery of Mainz. Credi rivalled Fra Bartolommeo in his attachment to Savonarola; but he felt no inclination for the retirement of a monastery. Still, in his old age, and after he had outlived the perils of the siege of Florence (1527), he withdrew on an annuity into the hospital of Santa Maria Nuova, where he died. The National Gallery, London, has two pictures of the Virgin and Child by him.

CREDIT (Lat. credere, to believe), in a general sense, belief or trust. The word is used also to express the repute which a person has, or the estimation in which he is held. In a commercial sense credit is the promise to pay at a future time for valuable consideration in the present: hence, a reputation of solvency and ability to make such payments is also termed credit. In bookkeeping credit is the side of the account on which payments are entered; hence, sometimes, the payments themselves.

The part which credit plays in the production and exchange of wealth is discussed in all economic textbooks, but special reference may be made to K. Knies, Geld und Credit (1873–1879), and H. D. Macleod, Theory of Credit (1889–1891). See also Hartley Withers, The Meaning of Money (1909).

CRÉDIT FONCIER, in France, an institution for advancing money on mortgage of real securities. Due to a great extent to the initiative of the economist L. Wolowski, it was created by virtue of a governmental decree of the 28th of February 1832. This decree empowered the issue of loans at a low rate of interest, secured by mortgage bonds, extending over a long period, and repayable by annuities, including instalments of capital. On its inception it had a capital of 25,000,000 francs and took the title
of Banque Foncière de Paris. The parent institution in Paris was followed by similar institutions in Nevers and Marseilles. These two were afterwards amalgamated with the first under the title of Crédit Foncier de France. The capital was increased to 60,000,000 francs, the government giving a subvention of 10,000,000 francs, and exercising control over the bank by directly appointing the governor and two deputy-governors. The administration was vested in a council chosen by the shareholders, but its decisions have no validity without the approval of the governor. The Crédit Foncier has the right to issue bonds, repayable in fifty or sixty years, and bearing a fixed rate of interest. A certain number of the bonds carry carries. The loans must not exceed half the estimated value of the property mortgaged, upon which the bank has the first mortgage. The bank also makes advances to local bodies, departmental and communal, for short or long periods, and with or without mortgage. Its capital amounts to £13,500,000. Its charter was renewed in 1884 for a period of ninety-nine years.

In 1860 the Crédit Foncier lent its support to the foundation of an organization for supplying capital and credit for agricultural and allied industries. This Crédit Agricole rendered, but trifling services to agriculture, however, and soon threw itself into speculation. Between 1873 and 1876 it lent enormous sums to the Egyptian government, obtaining the money by opening credit with the Crédit Foncier and depositing with it the securities of the Egyptian government. On the failure of the Egyptian government to meet its payments the Crédit Agricole went into liquidation, and the Crédit Foncier suffered severely in consequence. The impracticability of the credit system to aid agriculture was the result of the Crédit Agricole was very marked, and, as a consequence, the financing of agricultural associations is now entirely in the hands of the Banque de France.

The Crédit Mobiler is an institution for advancing loans on personal or movable estate. It was constituted in 1871, on the liquidation of the Société Générale de Crédit Mobiler, founded in 1854, when it absorbed the Crédit Mobiler of America, a construction company whose operations in connexion with the building of the Union Pacific Railroad gave rise to the most serious political scandal in the history of the United States Congress. The company was originally chartered as the Pennsylvania Fiscal Agency in 1859. In March 1864 a controlling interest in the stock was secured by Thomas Durant, vice-president of the Union Pacific Railroad Company, and the Pennsylvania legislature authorized the adoption of the name Crédit Mobiler of America. Durant proposed to utilize it as a construction company, pay it an extravagant sum for the work, and thus secure for the stockholders of the Union Pacific, who now controlled the Crédit Mobiler, the bonds loaned by the United States government. The net proceeds from the government and the first mortgage bonds issued to the construction company were $50,863,172.05, slightly more than enough to pay the entire cost of construction. According to the report of the Wilson Congressional Committee, the Crédit Mobiler received in addition, in the form of stock, income bonds, and land grant bonds, $23,000,000—a profit of about 48%. The defenders of the company assert that several items of expense were not included in this report, and that the real net profit was considerably smaller, although they admit that it was still unusually large. The work extended over the years 1865–1867. During the winter of 1867–1868, when adverse legislation by Congress was feared, it is alleged that Oakes Ames (q.v.), a representative from Massachusetts and principal promoter of the Crédit Mobiler, distributed a number of shares among congressmen and senators to influence their attitude. Shares were sold at par when a few dividends repaid a purchaser at this price. Some in fact received dividends without any initial outlay at all. As the result of a lawsuit between Ames and H. S. McComb, some private letters were brought out in September 1872 which gave publicity to the entire proceedings. The House appointed two investigating committees, the Poland and the Wilson committees, and on the report of the former (1873) Ames and James Brooks of New York were formally censured by the House, the former for disposing of the stock and the latter for improperly using his official position to secure part of it. Charges were also made against Schuyler Collax, then vice-president but Speaker of the House at the time of the transaction, James A. Garfield, William D. Kelley (1814–1880), John A. Logan, and several other members either of the House or of the Senate. The Senate later appointed a special committee to investigate the charges against its members. This committee, on the 27th of February 1873, recommended the expulsion from the Senate of James W. Patterson, of New Hampshire; but as his term expired within five days no action was taken. The evidence was exaggerated by the Democrats for partisan purposes, but the investigation showed clearly that most of those accused were at least indiscreet if not dishonest. The company itself was merely a type of the construction companies by which it was the custom to build railways between 1860 and about 1880.

See J. B. Crawford, The Crédit Mobiler of America (Boston, 1880), and R. Hazard, The Crédit Mobiler of America (Providence, 1881), both of which defend Ames; also the histories of the Union Pacific Railroad Company by J. P. Davis (Chicago, 1894) and H. K. White (Chicago, 1895); and for a succinct and impartial account, James Lord Rhodes, History of the United States, vol. viii. (New York, 1880).

The Poland and Wilson reports are to be found in House of Representatives Reports, 42nd Congress, 3rd session, Nos. 77 and 78, and the report of the Senate Committee in Senate Reports, 42nd Congress, 3rd session, No. 519.

CRÉDITON, a market town in the South Molton parliamentary district of Devonshire, England, 5 m. N.W. of Exeter by the London & South-Western railway. Pop. of urban district (1901) 3974. It is situated in the narrow vale of the river Creedy near its junction with the Exe, between two steep hills, and is divided into two parts, the east or old town and the west or new town. The church of Holy Cross, formerly collegiate, is one of the finest Perpendicular buildings with Early English and other early portions, and a fine central tower. The grammar school, founded by Edward VI. and refounded by Elizabeth, has exhibitions to Oxford and Cambridge universities. Shoe-making, tanning, agricultural trade, tin-plating, and the manufacture of confectionery and cider have superseded the former large woollen and serge industries. In 1897 Creédon was made the seat of a suffragan bishopric in the diocese of Exeter.

The first indication of settlement at Crediton (Credington, Crydleton, Kirton) is the tradition that Winfrith or Boniface was born there in 680. Perhaps in his memory (for the great extent of the parish shows that it was thinly populated) it became in 909 the seat of the first bishopric in Devonshire. It was probably only a village in 1049, when Leofric, bishop of Crediton, requested Leo IX. to transfer the see to Exeter, as Crediton was “an open town and much exposed to the incursions of pirates.” At the Domesday Survey much of the land was still uncultivated, but its prosperity increased, and in 1269 each of the twelve prebends of the collegiate church had a house and farmland within the parish. The bishops, to whom the manor belonged until the Reformation, had difficulty in enforcing their warren and other rights; in 1551 Bishop Grandson obtained an exemplification of judgments of 1282 declaring that he had pleas of winemesham, view of frank pledge, the gallowes and assize of bread and ale. Two years later there was a serious riot against the increase of copyhold. Perhaps the road, the best in the district, by which the credit of Crediton arose. The jury of the borough are mentioned in 1275, and Crediton returned two members to parliament in 1306–1307, though never afterwards represented. A borough seal dated 1469 is extant, but the corporation is not mentioned in the grant made by Edward VI. of the church to twelve principal inhabitants. The borough and manor were granted by Elizabeth to William Killigrew in 1595, but there is no indication of town organization then or in 1620, and in the 18th century Crediton was governed by commissioners. In 1231 the bishop obtained a fair, still held, on the vigil, feast and morrow of St Lawrence. This was important as the wool trade was established by 1249 and certainly continued until 1630, when the market for kerses is mentioned in conjunction with a saying “as fine as Kirton spinning.”

CREDNER, CARL FRIEDRICH HEINRICH (1809-1879), German geologist, was born at Waltershausen near Gotha, on the 13th of March 1809. He investigated the geology of the Thuringian Waldes, of which he published a map in 1846. He was author of a work entitled Über die Gliederung der oberen Juraf ormation und der Wealden-Bildung im nordwestlichen Deutschland (Prague, 1863), also of a geological map of Hanover (1865). He died at Halle on the 28th of September 1876.

His son, CARL HERMANN CRENNER (1841- ), was born at Gotha on the 1st of October 1841, educated at Breslau and Göttingen, and took the degree of Ph.D. at Breslau in 1864. In 1870 he was appointed professor of geology in the university of Leipzig, and in 1872 director of the Geological Survey of Saxony. He is author of numerous publications on the geology of Saxony, and of an important work, Elemente der Geologie (2 vols., 1872; 7th ed., 1891), regarded as the standard manual in Germany. He has also written memoirs on Saurians and Labyrinthodonts.

CREE, a tribe of North American Indians of Algonquian stock. They are still a considerable tribe, numbering some 15,000, and living chiefly in Manitoba and Assiniboia, about Lake Winnipeeg and the Saskatchewan river. They gave trouble by their constant attacks upon the Sioux and Blackfeet, but are now peaceable and orderly.

CREECH, THOMAS (1659-1700), English classical scholar, was born at Blandford, Dorsetshire, in 1659. He received his early education from Thomas Curgoven, master of Sherborne school. In 1675 he entered Wadham College, Oxford, and obtained a fellowship in 1683 at All Souls'. He was headmaster of Sherborne school from 1694 to 1696, and in 1699 he received a college living, but in June 1700 he hanged himself. The immediate cause of the act was said to be a money difficulty, though according to some it was a love disappointment; both of these circumstances no doubt had their share in a catastrophe primarily due to an already pronounced melancholia. Creec's fame rests on his translation of Lucretius (1682) in rhymed heroic couplets, in which, according to Otway, the pure ore of the original "somewhat seems refined." He also published a version of Horace (1684), and translated the Idylls of Theocritus (1684), the Theocritus (1693), the Astronomon of Manlius (1697), and parts of Plutarch, Virgil and Ovid.

CREEDS (Lat. credo, I believe), or ConFESSIONS OF FAITH. We are accustomed to regard the whole conception of creeds, i.e. reasoned statements of religious belief, as inseparably connected with the history of Christianity. But the new study of comparative religion has something to teach us even here. The saying lex orandi lex credendi is true of all times and of all peoples. And since we must reckon praise as the highest form of prayer, such an early Christian hymn as is found in Tim. iii. 16 must be acknowledged to be of the nature of a creed: "He who was manifested in the flesh, justified in the spirit, seen of angels, preached among the nations, believed on in the world, received up in glory." It justifies the expansion of the second article of the developed Christian creed from the standpoint of the earliest Christian tradition. It also supplies a reason for including in our survey of creeds some reference to pre-Christian hymns and beliefs. The pendulum has swung back. Rather than despise the faulty presentation of truth which we find in heathen religions and their more or less degraded rites, we follow the apostle Paul in his endeavours to trace in them attempts "to feel after God and to be enlightened" (Acts xiv. 15). Augustine, the great teacher of the West, was true to the spirit of the great Alexandrines, when he wrote (Ep. 166): "Let every good and true Christian understand that truth, wherever he finds it, belongs to his Lord."

We are not concerned with the question whether the earliest forms of recorded religious consciousness such as animism, or totemism, or fetishism, were themselves degradations of a primitive revelation or not. We are only concerned with the fact of experience that the human soul yearns to express its beliefs. The hymn to the rising and setting sun in the Book of the Dead (ch. 13), which is said by Egyptologists to be the oldest poem in the world, carries us back at once to the dawn of history.

"Hail to thee, Ra, the self-existent . . . Glorious is thine uprising from the horizon. Both worlds are illumined by thy rays . . . Hail to thee, Ra, when thou returnest home in renewed beauty, crowned and almighty."

In a later hymn Amen-Ra is confessed as "the good beloved, maker of men, creator of beasts, maker of things below and above, lord of mercy most loving." A similar note is struck in the Indian Vedas. In more ethical religion of the Avesta the Creator is more clearly distinguished from the creature: "I desire to approach Ahura and Mithra with my praise, the lofty eternal, and the holy two." The Persian poet is not far from the kingdom into which Hebrew psalmists and prophets entered.

The whole history of the Jewish religion is centred in the gradual purification of the idea of God. The morality of the Jews did not outgrow their religion, but their interest was always ethical and not speculative. The highest strains of the psalmists and the most fervent appeals of the prophets were progressively directed to the great end of praising and preaching the One true God, everlasting, with sincere and pure devotion. The creed of the Jew, to this day, is summed up in the well-remembered words, which have been ever on his lips, living or dying: "Hear, O Israel, the Lord our God is one Lord" (Deut. iv. 4).

The definiteness and persistence of this creed, which of course is the strength also of Mahommedanism, presents a contrast to the fluid character of the statements in the Vedas, and to the chaos of conflicting opinions of philosophers among the Greeks and Romans. As Dr J. R. Illingworth has said very concisely: "The physical speculations of the Ionians and Atomists rendered a God superfluous, and the metaphysical and logical reasoning of the Eleatics declared Him to be unknowable." Plato regarding the world as an embodiment of eternal, archetypal ideas, which he groups under the central idea of Good, identified with the divine reason, at the same time uses the ordinary language of the day, and speaks of God and the gods, feeling his way towards the conception of a personal God, which, to quote Dr Illingworth again, neither he nor Aristotle could reach because they had not "a clear conception of human personality." They were followed by an age of philosophizing which did little to advance speculation. The Stoics, for example, were more successful in criticizing the current creed than in explaining the underlying truth which they recognized in polytheism. The final goal of Greek philosophy was only reached when the great thinkers of the early Christian Church, who had been trained in the schools of Alexandria and Athens, used its modes of thought in their analysis of the Christian idea of God. "In this sense the doctrine of the Trinity was the synthesis, and summary, of all that was highest in the Hebrew and Hellenic conceptions of God, fused into union by the electric touch of the Incarnation." 4

Space does not permit enlargement on this theme, but enough has been said to introduce the direct study of the ancient creeds of Christendom.

I. THE ANCIENT CREEDS OF CHRISTENDOM.—The three creeds which may be called eccumenical, although the measure of their acceptance by the universal church has not been uniform, represent three distinct types provided for the use of the catechumens, the communicant, and the church teacher respectively. The Apostles' Creed is the ancient baptismal creed, held in common both by East and West, in its final western form. The Nicene Creed is the baptismal c eed of an eastern church enlarged in order to combine theological interpretation with the facts of the historic faith. Its use in the Eucharist of the undivided Church has been continued since the great schism, although the Eastern Church protests against the interpolation

2. Sacred Books of the East, xxxi.
of the words “And the Son” in clause 9. The Athanasian Creed is an instruction designed to confuse heresies which were current in the century.

**Apostles’ Creed.** —The increased interest which has been shown in the history of all creed-forms since the latter part of the 19th century is due in a great measure to the work of the veteran pioneer, Professor P. Caspari of Christiania, who began the herculean task of classifying the enormous number of creed-forms which have been recovered from obscure pages of early Christian literature. In England we owe much to Professors C. A. Heurtley and Swanston. In Germany the monumental work of Professor Kattenbusch has overshadowed all other books on the subject, providing even his most ardent critics with an indispensable record of the literature of the subject.

The majority of critics agree that the only trace of a formal creed in the New Testament is the simple confession of Jesus as the Lord, or the Son of God (Rom. x. 9; 1 Cor. xii. 3). While the apostles were agreed on an outline of teaching (Rom. vii. 17) which included the doctrine of God, the person and work of Christ, and the person and work of the Holy Spirit, it does not appear that they provided any summary, which would cover this ground, as an authoritative statement of their belief. The tradition which St Paul received included, so to speak, the germ of the central prayer in the Eucharist (1 Cor. xi. 26 f.), and no doubt included also teaching on conduct, “the way of a Christian life” (1 Thess. iv. 1; Gal. v. 21). The creed in all its forms lies behind worship, which it preserves from idolatry, and behind ethics, to which it supplies a motive power which the pre-Christian system so manifestly lacked.

Whether the first creed of the primitive Church was of the simple Christological character which confession of Jesus as the Lord expresses, or of an enlarged type based on the baptismal formula (Matt. xxviii. 19), makes no difference to the statement that the faith which overcame the world derived its energy from convictions which strove for utterance. “With the heart man believeth unto righteousness, and with the mouth confession is made unto salvation” (Rom. x. 10).

When St Paul reminds Timothy (1 Tim. vi. 13) of his confession before many witnesses he does not seem to imply more than confession of Christ as king. He calls it “the beautiful confession” to which Christ Jesus had borne witness before Pontius Pilate, and charges Timothy before God, who quickeneth all things, to keep this commandment. Some writers, notably Professor Zahn,1 piecing together this text with 2 Tim. i. 13, ii. 8, iv. 1, 2, reconstructs a primitive Apostles’ Creed of Antioch, the city from which St Paul started on his missionary journeys. But there is no mention of a third article in the creed, beyond a reference to the Holy Ghost in the context of 2 Tim. i. 14, which would prove the apostolic use of a Trinitarian confession imaginable as the parent of the later Eastern and Western forms. The eunuch’s creed interpolated in Acts viii. 57, “I believe that Jesus is the Son of God,” since the reading was known to Irenaeus, probably represents the form of baptismal confession used in some church of Asia Minor, and supplies us with the type of a primitive creed. This theory is confirmed by the evidence of the Johannine epistles (1 John iv. 15, v. 5; cf. Heb. iv. 14).

From this point of view it is easy to explain the occurrence of creed-like phrases in the New Testament as fragments of early hymns (1 Tim. iii. 16) or reminiscences of oral teaching (1 Cor. xv. 1 f.). The following form which Seeberg gives as the creed of St Paul is an artificial combination of fragments of oral teaching, which naturally reappear in the teaching of St Peter, but finds no attestation in the later creeds of particular churches which would prove its claim to be their parent form:

“The living God who created all things sent His Son Jesus Christ, born of the seed of David, who died for our sins according to the scriptures, and was buried, who was raised on the third day according to the scriptures, and appeared to Cephas and the XII., who sat at the right hand of God in the heavens, all rule and authority and power being made subject unto Him, and is coming on the clouds of heaven with power and great glory.”

The evidence of the apostolic fathers is disappointing. Clement (Cor. viii. 2) supplies only parallels to the baptismal formula (Matt. xxviii. 19). Polycarp (Ep. 7) echoes St John. But Ignatius might seem to offer in the following passage some confirmation of Zahn’s theory of a primitive creed of Antioch (Troll. 9): “Be ye dead, therefore, when any man spaketh to you apart from Jesus Christ, who was of the race of David, who was the Son of Mary, who was truly born and ate and drank, was truly crucified and died in the sight of those in heaven and those on earth, who, moreover, was truly raised from the dead, His Father having raised Him, who in the like fashion will so raise us also who believe on Him—His Father, I say, will raise us—in Christ Jesus, apart from whom we have not true life.”

The differences, however, which divide this from the later creed forms are scarcely less noticeable than their agreement, and the evidence of the Ignatian epistles generally (Eph. xviii.; Smyrn.) while it confirms the conclusion that something was given in Antioch on all points characteristic of the developed creed, e.g. the Miraculous Birth, Crucifixion, Resurrection, the Catholic Church, forgiveness of sins, the hope of resurrection, does not prove that this teaching was as yet combined in a Trinitarian form which classified the latter clauses under the work of the Holy Ghost.

At this point a word must be said on the important question of interpretation. While we may hope for eventual agreement on the history of the different types of creed forms, there can be no hope of agreement on the interpretation of the words Holy Spirit between Unitarian and Trinitarian critics. Writers who follow Harnack explain “holy spirit” as the gift of impersonal influence, and between wide limits of difference agree in regarding Christ as Son of God by adoption and not by nature. Amid the chaos of conflicting opinions as to the original teaching of Jesus, the Gospel within the Gospel, the central question “What think ye of Christ?” emerges as the test of all theories. “No man can say that Jesus is the Lord save in the Holy Ghost” (1 Cor. xii. 3). Belief in the fact of the Incarnation of the eternal Word, as stated in the words of Ignatius quoted above, or in any of the later creeds, stands or falls with belief in the Holy Ghost as the guide alike of their convictions and destinies, no mere impersonal influence, but a living voice.

If the essence of Christianity is winnowed down to a bare imitation of the Man Jesus, and his religion is accepted as Buddhists accept the religion of Buddha, still it cannot be denied that the early Christians put their trust in Christ rather than his religion. “I am the life,” not “I teach the life,” “I am the truth,” not merely “I teach the truth,” are not additions of Johannine theology but the central aspect of the presentation of Christ as the good physician, healer of souls and bodies, which the most rigid scrutiny of the Synoptic Gospels leaves as the residuum of accepted fact about Jesus of Nazareth. To say more would be out of place in this article, but enough has been said to introduce the exhaustive discussion by Kattenbusch (ii. 471–728) of the meaning of the theological teaching both of the New Testament and of the earliest creeds.

To return within our proper limits. Kattenbusch, with whom Harnack is in general agreement, regards the Old Roman Creed, which comes to light in the 4th century, as the parent of all developed forms, whether Eastern or Western. Marcellus, the exiled bishop of Ancyra, is quoted by Epiphanius as presenting it to Bishop Julius of Rome c. A.D. 340. Uscher’s recognition of the fact that this profession of faith by Marcellus was the creed of Rome, not of Ancyra, is the starting-point of modern discussions of the history of the creeds. Some sixty years later Rufinus, a priest of Aquileia, wrote a commentary on the creed of his native city and compared it with the Roman Creed. His Latin text is probably as ancient as the Greek text of Marcellus, because the Roman Church must always have been bilingual in its early days. It was as follows:

---

1 Der Katechismus der Urchristenheit, p. 85. Zahn’s reasoned argument stands in contrast to the blind reliance on tradition shown by Macdonald, The Symbol of the Apostles, and the fanciful reconstruction of the primitive creed by Baeumer, Harnack or Seeberg.
I. 1. I believe in God (the) Father almighty;
II. 2. And in Christ Jesus His only Son our Lord,
3. who was born of the Holy Spirit and the Virgin Mary,
4. crucified under Pontius Pilate and buried
5. the third day He rose from the dead,
6. He ascended into heaven,
7. sitteth at the right hand of the Father,
8. thence He shall come to judge living and dead.
III. 9. And in the Holy Ghost,
10. (the) Holy Church,
11. (the) remission of sins,
12. (the) resurrection of the flesh.

This Old Roman Creed may be traced back in the writings of Bishops Felix and Dionysus (3rd century), and in the writings of Tertullian in the 2nd century.

Tertullian calls the creed the “token” which the African Church shares with the Roman (de Praescr. 6): “The Roman Church has made a common token with the African Churches, has recognized one God, creator of the universe, and Christ Jesus, of the Virgin Mary, Son of God the Creator, and the resurrection of the flesh.” The reference is to the earthware token which two friends broke in order that they might commend a stranger for hospitality by sending with him a broken half. Their creed became the passport by which Christians in strange cities could obtain admission to assemblies for worship and to common meals. The passage quoted is obviously a condensed quotation of the Roman Creed, which reappears also in the following (de Virg. vol. i.):

"The rule of faith is one altogether... of believing in one God Almighty, maker of the world, and in His Son Jesus Christ, born of Mary the Virgin, crucified under Pontius Pilate; the third day raised from the dead, received into heaven, sitting at the right hand of the Father, about to come and judge quick and dead through the resurrection also of the flesh."

There are many references in Tertullian to the teaching of the Gnostic Marcion, whose breach with the Roman Church may be dated A.D. 145. He seems to have still held to the Roman creed interpreted in his own way. An ingenious conjecture by Zahn enables us to add the words “holy Church” to our reconstruction of the creed from the writings of Tertullian. In his revised New Testament Marcion speaks of “the covenant which is the mother of us all, which begets us in the holy Church, to which we have vowed allegiance.” He uses a word used by Ignatius of the oath taken on confession of the Christian faith. It follows that the words “holy Church” were contained in the Roman Creed.

While all critics agree tracing back this form to the earliest years of the 2nd century, and regard it as the archetype of all similar Western creeds, there is great diversity of opinion on its relation to Eastern forms. Kattenbusch maintains that the Roman Creed reached Gaul and Africa in the course of the 2nd century, and perhaps all districts of the West that possessed Christian congregations, also the western end of Asia Minor possibly in connexion with Polycarp’s visit to Rome A.D. 154. He finds that materials fall for Pontus, Galatia, Cappadocia, Syria, Palestine, Egypt. Further, he holds that all the Eastern creeds which are known to us as existing in the 4th century, or may be traced back to the 3rd, lead to Antioch as their starting-point. He concludes that the Roman Creed was accepted at Antioch after the fall of Paul of Samosata in A.D. 272, and was adapted to the dogmatic requirements of the time, all the later creeds of Palestine, Asia Minor and Egypt being dependent on it.

On the other hand, Kunze, Loofs, Sunday, and Zahn find evidence of the existence of an Eastern type of creed of equal or greater antiquity and distinguished from the Roman by such phrases as “One (the) God,” “Maker of heaven and earth,” “suffered,” “shall come again in glory.” Thus Kunze reconstructs a creed of Antioch for the 3rd century, and argues that it is independent of the Roman Creed.

CREEDS

I. 1. I believe in one and one only true God, Father Almighty,
II. 2. And in our Lord Jesus Christ, His Son, the only-begotten and first born of all creation, begotten of Him before all the ages, through whom also the ages were established, and all things came into existence;
III. 3. Who for our sakes, came down, and was born of Mary the Virgin,
4. And crucified under Pontius Pilate, and buried,
5. And the third day rose according to the scriptures,
6. And ascended into heaven.
7. 8. And is coming again to judge quick and dead.
9. [The beginning of the third article has not been recorded.]
10. 11. Remission of sins.
12. Resurrection of the dead, life everlasting.

Along similar lines Loofs selects phrases as typical of creeds which go back to a date preceding the Nicene Council.
A. Creed of Eusebius of Caesarea, presented to the Nicene Council.
B. Revised Creed of Cyril of Jerusalem.
C. Creed of Antioch quoted by Cassian.
D. Creed of Antioch quoted in the Apostolic Constitutions.
E. Creed of Lucian the Martyr (Antioch).
F. Creed of Arius (Alexandria).

1. One (God), A, B, C, D, E, F.
2. Lord Jesus Christ, His Son, the only begotten (or a like phrase), A, B, C, D, E.
3. Crucified under Pontius Pilate, B, C, D (A, E, F omit because they are theological creeds. Loofs thinks that the baptismal creeds on which they are based have contained the words).
4. Rose the third day, A, B, D, E (F omits “the third day” being a theological creed; the translation of C is uncertain).
5. Went up, A, B, D, E, F.
6. +and ... and ... and, A, B, C, D, E, F.
7. And is coming, B, C, D, E, F, and is about to come, A, +again, A, C, D, E, F(?) +in glory, A, B, with glory, D, E.
8. +Catholic, B, D, F (A, C, E)?
9. +life eternal, B, C; +life of the age to come, D, F.

Sandy (Journal Theol. Studies, iii. 1) does not attempt a reconstruction on this elaborate scale, but contents himself with pointing out evidence, which Kattenbusch seems to him to have missed, for the existence of creeds of Egypt, Cappadocia and Palestine before the time of Aurelian. He criticizes Harnack’s theory that there existed in the East, that is, in Asia Minor, or in Asia Minor and Syria as far back as the beginning of the 2nd century, a Christological instruction (μαθημα) organically related to the second article of the Roman Creed, and formulates which taught that the “One God” was “Creator of heaven and earth,” and referred to the holy prophetic spirit, and lasted on till they influenced the course of creed-development in the 4th century. He asks, is it not simpler to believe that there was a definite type in the background?

Another English student, the Rev. T. Barns, engaged specially in work upon the history of the creed of Cappadocia, points out the importance of the extraordinary influence of Firmilian of Caesarea in the affairs of the church of Antioch in the early part of the 3rd century. He is led to argue that the creed of Antioch came rather from Cappadocia than Rome. Whether his conclusion is justified or not, it helps to show how strongly the trend of contemporary research is setting against the theory of Kattenbusch that the Roman Creed when adopted at Antioch became the parent of Eastern creeds. He does not, however, militate against the possibility that the Roman Creed was carried from Rome to Asia Minor and to Palestine in the 2nd century. It is evidently impossible to arrive at a final decision until much more spade work has been done in the investigation of early Eastern creeds. Connolly’s study of the early Syrian creed (Zeitschrift für die neutestamentliche Wissenschaft, 1906, p. 202) deserves careful consideration. His reconstruction of the creed of Aphraates is interesting in relation to the other traces of a Syriac creed form existing prior to the 4th century.

[1] I believe in God the Lord of all, that made the heavens and the earth and the seas and all that is in them; [2] And in our Lord Jesus Christ...
Christ [the Son of God], God, Son of God, King, Son of the King, Light from Light, (Son and Counsellor, and Guide, and Way, and Saviour, and Shepherd, and Catherer, and Door, and Pearl, and Lamp,) and first-born of all creatures, who came and put on a body from the Virgin the seed of the house of David, from the Holy Spirit), and put on our manhood, and suffered, and was crucified, went down to the place of the dead, or to Sheol, and lived again, and rose the third day, and ascended to heaven, and sat on the right hand of His Father, and He is the first-born of the dead and of the living, who sitteth on the throne; [And in the Holy Spirit:] And I believe in the coming to life of the dead; and in the mystery of Baptism (of the remission of sins).

The probable battle-ground of the future between the opposing theories lies in the writings of Irenaeus. He has most of the characteristic expressions of the Eastern creeds. He inserts "one" in clause 1 and 2. He has the phrases "Maker of heaven and earth," and "Maker of heaven and earth," and "crucified with us under Pontius Pilate," after instead of before it. Probably also he had "in glory," in clause 8. But there is always the possibility to be faced that Irenaeus drew his creed from Rome rather than Asia Minor. Kattenbusch does not shrink from suggesting that he shows acquaintance with the Roman Creed, and that Justin Martyr also knew it, in which case all the so-called Eastern characteristics have been imprinted on the original Roman form, and are not derived from an Eastern archetype. The plain fact is that the same facts were taught in Palestine, Asia Minor and Gaul, whether gathered up in a parallel creed form or not. The contrast which Rufinus draws between the Roman Creed and others, both of the East and the West, is justified. In comparison with them it was guarded more carefully from change. We have yet to inquire how it received the additions which distinguish the derived form now in use as the baptismal creed of all Western Christendom. Some had already found an entrance into Western creeds. We find "suffered" in the creed of Milan, "descended into hell." In the creed of Aquileia, the words "under Pontius Pilate, and "crucified with us" were shortly added to clause 7 in the Spanish creed; "life everlasting" had stood from an early date in the African creed. The creed of Caesarius of Arles (d. 543) proves that these variations had all been united in one Gallican creed together with "catholic," and "communion of saints," but this Gallican form still lacked "Maker of heaven and earth," and the additions in clause 7.

Two newly-discovered creeds help us greatly to narrow down the limits of the problem. The creed of Niceta of Remesiana in Dacia proves that c. A.D. 400 the Dacian church had added to the Roman Creed "maker of heaven and earth," "suffered," "dead," "Catholic," "communion of saints," and "life everlasting." Parallel to it is the Faith of St Jerome discovered in 1903 by Dom. Morin.2

The Faith of St Jerome.

"I believe in one God the Father almighty, maker of things visible and invisible. I believe in one Lord Jesus Christ, the Son of God, born of God, Light of Light, almighty of almighty, true God of true God, born before the ages, not made, by whom all things were made in heaven and in earth, who for our salvation was crucified and buried in the Holy Ghost, born of the Virgin Mary, suffered by suffering under Pontius Pilate, under Herod the King, crucified, buried, descended into hell, stood the sting of death, rose again the third day, appeared to the apostles, ascended to heaven, sitteth at the right of God the Father, thence shall come to judge the quick and the dead. And I believe in the Holy Ghost, God not begotten nor begotten, not created nor made, co-eternal with the Father and the Son. I believe (that there is) remission of sins in the holy catholic church, communion of saints, resurrection of the flesh unto eternal life. Amen."

This creed may be the form which Jerome mentions in one of his letters (Ep. 17, n. 4) as sent to Cyril of Jerusalem. It is important as connecting the creeds of East and West. Since Jerome was born in Pannonia we may conjecture that he is inserting Nicene phrases from the Jerusalem creed into his baptismal creed, and that this form added to Niceta's creed proves that the creed of the Dacian lands possessed the clauses "maker of heaven and earth," and "communion of saints." The first occurrence of the completed form is in a treatise (Sacræopus) of the Benedictine missionary Pirminius, abbot of Reichenau (c. A.D. 730). The difficulty hitherto has been to trace the source from which the clause "maker of heaven and earth" has come into it. It has been known that the forms in use in the south of France approximated to it but without those words. In the 6th century we find creed forms in use in Gaul which include them, but include also other variations distinguishing them from the form which we seek. The missing link which has hitherto been lacking in the evidence has been found by Barns in the influence of Celtic missionaries who streamed across from Europe until they came in touch with the remains of the Old Latin Christianity of the Danube. The chief documents of the date A.D. 700, which contain forms almost identical with the received text, are connected with monasteries founded by Columban and his friends: Bobbio, Luxeuil, S. Gallen, Reichenau. From one of these monasteries the received text seems to have been taken to Rome. Certainly it was from Rome that it was spread. We can trace the use of the received text along the line of the church of Gaul and Spanish. There is no little doubt that they received it from the Roman Church, with which Boniface was in frequent communication. Pope Gregory II. sent him instructions to use what seems to have been an official Roman order of Baptism, which would doubtless include a Roman form of creed. Pirminius, who was far from being an original writer, made great use of a treatise by Martin of Braga, but substituted a Roman form of Renunciation, and refers to the Roman rite of Baptism in a way which leads us to suppose that the form of creed which he substituted for Martin's form was also Roman. It seems clear, therefore, that the received text was either made or accepted in Rome, c. A.D. 700, and disseminated through the Benedictine missionaries. At the end of the 8th century Charlemagne inquired of the bishops of his empire as to current forms. The reply of Amalarius of Trier is important because it shows that he not only used the received text, but also connected it with the Roman order of Baptism. The emperor's wish for uniformity doubtless led in a measure to its eventual triumph over all other forms.

2. The Nicene Creed. To this brings, often called the Constantinopolitan creed, is the old baptismal creed of Jerusalem revised by the insertion of Nicene terms. The idea that the council merely added to the last section has been disproved by Hort's famous dissertation in 1876. The text of the creed of the Nicene Council was based on the creed of Eusebius of Caesarea, and a comparison of the four creeds side by side proves to demonstrate their distinctness, in spite of the tendency of copyists to confuse and assimilate the forms.

Credo of Eusebius, A.D. 325

(Caesarea).

We believe

I. 1. In one God the Father almighty, the maker of all things visible and invisible.

II. 2. And in one Lord Jesus Christ, the Word of God, God of God, Light of Light, (Life of Life,) only begotten Son (first-born of all creation, before all worlds begotten of God the Father), by whom all things were made;

Revision by the Council of Nicaea, A.D. 325.

We believe

I. 1. In one God the Father Almighty, the maker of all things visible and invisible.

II. 2. And in one Lord Jesus Christ, the Son of God, begotten of the Father, only begotten, that is of the substance of the Father.

God of God, Light of Light, (Life of Life,) only begotten Son (first-born of all creation, before all worlds begotten of God the Father), by whom all things were made;

3 Döhrn has shown that Porvius (d. 1632) was the first to remark that the so-called Constantinopolitan form was quoted by Epiphanius before the Council met, but was not able to explain the fact.

Who for our salvation was incarnate (and lived as a citizen amongst men), and suffered, and rose the third day, and ascended to the Father, and shall come again (in glory) to judge quick and dead.

III. 8. And (we believe) in (one) Holy Ghost.

Creed of Jerusalem, A.D. 334.

I (or We) believe.

1. In one God the Father, Almighty, maker of heaven and earth, and of all things visible and invisible.

2. And in one Lord Jesus Christ, the only begotten Son of God, begotten of His Father, very God before all worlds, by whom all things were made;

3. Who for us men and for our salvation came down from heaven and was incarnate of the Holy Ghost and the Virgin Mary, and was made Man.

4. And was crucified also for us under Pontius Pilate, and suffered and was buried, and rose again the third day,

5. And ascended into heaven and sitteth on the right hand of the Father,

6. And shall come in glory to judge the quick and the dead, whose kingdom shall have no end.

Who spake in the Prophets.

And in one baptism of repentance for remission of sins, and in one holy Catholic Church,

And in resurrection of the flesh,

And in life eternal.

The revised Jerusalem Creed was quoted by Epiphanius in his treatise The Anchored One, c. A.D. 374, some years before the council of Constantinople (A.D. 381). We gather that it had already been introduced into Cyprus as a baptismal creed. Hort's identification of it as the work of Cyril of Jerusalem is now generally accepted. On his return from exile in A.D. 362 Cyril would find "a natural occasion for the revision of the public creed by the skilful insertion of some of the conciliar language, including the term which proclaimed the restoration of full communion with the champions of Nicaea, and other phrases and clauses adapted for impressing on the people positive truth."

Some of Cyril's personal preferences expressed in his cathechetical lectures find expression, e.g. "resurrection of the dead" for "flesh."

The weak point in Hort's theory was the suggestion that the creed was brought before the council by Cyril in self justification. The election of Meletius of Antioch as the first president of the council carried with it the vindication of his old ally Cyril. Kunze's suggestion is far more probable that it was used at the baptism of Nektarius, praetor of the city, who was elected third president of the council while yet unbaptized. Unfortunately the acts of the council have been lost, but they were quoted at the council of Chalcedon in A.D. 451, and the revised Jerusalem Creed was quoted as "the faith of the 150 Fathers," that is, as confirmed in some way by the council of Constantinople, while at the time it was distinguished from "the faith of the 318 Fathers" of Nicaea. One of the signatories of the Definition of Faith made at Chalcedon, in which both creeds were quoted in full, Kalednikus, bishop of Apamea in Bithynia, refers to the council of Constantinople as having been held at the ordination of the most pious Nektarius the bishop. Obviously there was some connexion in his mind between this creed and the ordination.

The reasons which brought the revised creed into prominance at Chalcedon are still obscure. It is possible that Leo's letter to Flavian gave the impulse to put it forward because it contained a parallel to words which Leo quoted from the Old Roman Creed, "born of the Holy Ghost and the Virgin Mary," "crucified and buried," which do not occur in the first Nicene Creed. If, as is probable, it was from the election of Nektarius the baptismal creed of Constantiople, we may even ask whether the pope did not refer to it when he wrote emphatically of the "common and indistinguishable confession" of all the faithful. Kattenbusch supposes that Anatolius, bishop of Constantinople, or his archdeacon Aetius, who read the creed at the 2nd session of the council, took up the idea that through its likeness to the Roman Creed it would be a useful weapon against Eutyches and others who were held to interpret the Nicene Creed in an Apollinarian sense. But Kunze thinks that it was not used as a base of operations against Eutyches because there is some evidence that Monophysites were willing to accept it. Certainly it won its way to general acceptance in the East as the creed of the church of the imperial city; regarded as an improved recreation of the Nicene Faith. The history of the introduction of the creed into literature is still obscure. Peter Fullo, bishop of Antioch, was the first to use it in the East, and in the West a council held by King Recared at Toledo in 580. The theory of Probst that it had been used in Rome before this time has not been confirmed. King Recared's council is usually credited with the introduction of the words "And the Son," into clause 9 of the creed. But some MSS. omit them in the creed-text while inserting them in a canon of the faith drawn up at the time. Probably they were interpolated in the creed by mistake of copyists. When attention was called to the interpolation in the 9th century it became one cause of the schism between East and West. Charlemagne was unable to persuade Pope Leo III. to alter the text used in Rome by including the words. But it was so altered by the pope's successor.

The interpolation really witnessed to a deep-lying difference between Eastern and Western theology. Eastern theologians expressed the mysterious relationship of the Holy Spirit to the Father and the Son in such phrases as "Who proceedeth from the Father and receiveth from the Son," rightly making the Godhead of the Father the foundation and primary source of the eternally derived Godhead of the Son and the Spirit. Western theologians approached the problem from another point of view. Hilary, starting from the right of Divine self-consciousness  e.g. Cod. Escurial f. 12, saec. x, xi. In Cod. Matriotes, p. 21 (1872), saec. x, xi., and Cod. Matriotes, 10041 (begun in the year A.D. 948), the words are omitted under the heading council of Constantinople but inserted under the heading council of Toledo, in the former MS., above the line and in a later hand, which shows conclusively how the interpolation crept in.
as the explanation of the coinherence of the Father in the Son and the Son in the Father, says that the Spirit receives of both. Augustine teaches that the Father and the Son are the one principle of the Being of the Spirit. From this it is a short step to say with the Quicumque vult that the Spirit proceeds from the Son, while guarding the idea that the Father is the one fountain of Deity. Since Eastern theologians would be willing to say "proceeds from the Father through the Son," it is clear that the two views are not irreconcilable.

3. The Athanasian Creed, so called because in many MSS. it bears the title "The Faith of S. Athanasius," is more accurately designated by its first words Quicumque vult. Its history has been the subject of much controversy for years past, but no longer presents an insoluble problem. Critics indeed agree on the main outline. Until 1870 the standard work on the subject was Waterland's Critical History of the Athanasian Creed, first published in 1723. Having traced "the opinions of the learned moderns" from Gerard Vossius, a.D. 1642, "who led the way to a more strict and critical inquiry," Waterland passed in review all the known MSS. and commentaries, and after a searching investigation concluded that the creed was written in Gaul between 420 and 430, probably by Hilary of Arles.

In the controversy on the use of the creed in the Book of Common Prayer led to fresh investigation of the MSS., and a theory known as the "Two-partition theory" was started by C. A. Swainson, developed by J. R. Lumby, and adopted by Harnack. Swainson thought that the Quicumque was brought into its present shape in the 9th century. The so-called profession of Denebert, bishop-elect of Worcester, in a.D. 798 presented to the archbishop of Canterbury (which includes clauses 1, 3-6, 20-22, 24, 25), and the Trèves fragment (a portion of a sermon in Paris bibl. nat. Lat. 3836, sacc. viii., which quoted clauses 27-34, 36-40), seemed to him to represent the component parts of the creed as they existed separately. He conjectured that they were brought together in the province of Rheims c. 860.

This theory, however, depended upon unverified assumptions, such as the supposed silence of theologians about the creed at the beginning of the 9th century; the suggestion that the completed creed would have been useful to them if they had known it as a weapon against the heresy of Adoptionism; the assertion that no MSS. contained the complete text of earlier years; and finally the assumption that the creed, shaped by Leidrad, its reviser, in 813, after the fall of the Empire, to meet the needs of the Church, was the standard creed for 500 years.

To-day this controversy on the use of the creed in the Book of Common Prayer led to fresh investigation of the MSS., and a theory known as the "Two-partition theory" was started by C. A. Swainson, developed by J. R. Lumby, and adopted by Harnack. Swainson thought that the Quicumque was brought into its present shape in the 9th century. The so-called profession of Denebert, bishop-elect of Worcester, in a.D. 798 presented to the archbishop of Canterbury (which includes clauses 1, 3-6, 20-22, 24, 25), and the Trèves fragment (a portion of a sermon in Paris bibl. nat. Lat. 3836, sacc. viii., which quoted clauses 27-34, 36-40), seemed to him to represent the component parts of the creed as they existed separately. He conjectured that they were brought together in the province of Rheims c. 860.

This theory, however, depended upon unverified assumptions, such as the supposed silence of theologians about the creed at the beginning of the 9th century; the suggestion that the completed creed would have been useful to them if they had known it as a weapon against the heresy of Adoptionism; the assertion that no MSS. contained the complete text of earlier years; and finally the assumption that the creed, shaped by Leidrad, its reviser, in 813, after the fall of the Empire, to meet the needs of the Church, was the standard creed for 500 years.

The two-partition theory was vigorously attacked by G. D. W. Ommenay, who was successful in the discovery of new documents, notably early commentaries, which contained the text of the creed embedded in them, and thus supplied independent testimony to the fact that the creed was becoming fairly widely known at the end of the 8th century. Other new MSS. and commentaries were found and collated by the Rev. A. E. Burn and Dom Morin. In 1897 Loofs, summing up the researches of 25 years in his article Athanasianum (Realencyclopadie f. prot. Theol. u. Kirche, 3rd ed. ii. p. 177), declared that the two-partition theory was dead.

This conclusion has never been seriously challenged. It has been greatly strengthened by the discovery of a MS. which was presented by Bishop Leidrad of Lyons with an autograph inscription to the altar of St Stephen in that town some time before 814. A. M. teaches that this was the same autograph that Father Leblond rev. d. 1838 by chance found in the storeroom of a church at Lyons, and that it was the manuscript of the famous Golden Psalter, now at Vienna, which contains the same collection of documents as an introduction. This MS. may now without hesitation be assigned to the date 772-788. The earliest known MS. is at Milan (Cod. Ambros. O., 212, sup.), and is dated by Taurbe at earliest as c. 700.

There is a reference to the Quicumque in the first canon of the fourth council of Toledo of the year 633, which quotes part or the whole of clauses 4, 20-22, 28 f., 31, 33, 35 f., 40. The council also quoted phrases from the so-called Creed of Domasus, a document of the 4th century, which in some cases they preferred to the phrases of the Quicumque. Their quotations form a connecting link in the chain of evidence by which the use of the creed may be traced back to the writings of Caesarius, bishop of Arles (503-543). Dom Morin has now demonstrated ("Le Symbole d'Athanase et son premier témoin S. Césaire d'Arles," Rev. Bénédictine, Oct. 1901) that Caesarius used the creed continually as a sort of elementary catechism. The fact that it exactly reproduces both the qualities and the literary defects of Caesarius is a strong argument in favour of Morin's suggestion that he may have been the author. Further, Caesarius was in the habit of using parts of a psalter by replacing the words of it with those of his compositions, which would account for the fact that the name of Athanasius was subsequently attached to the creed.

The use, however, of the Quicumque by Caesarius as a catechism may be explained by the suggestion that it had been taught him in his youth, so that his style had been moulded by it. He was not an original thinker. Moreover, the creed is quoted by his rival Avitus, bishop of Vienne 490-523, who quotes clause 22, as from the Rule of Catholic Faith, but was not likely to value a composition of Caesarius so highly. Morin does not deal fully with the arguments from internal evidence which point back to the beginning of the 5th century as the date of the creed. If the creed-phrases needed sharpening against the revived Nestorian error of the Adoptianists, it is scarcely likely to have been written during the generation following the condemnation of Nestorius in 431. Burn suggests that it was written to meet the Sabellian and Apollinarian errors of the Spanish heretic Priscillian, possibly by Honoratus, bishop of Arles (d. 429). He suggests further that the Creed of Domasus was the reply of that poison to Priscillian. It was soon made use of in one of his compositions, which would account for the fact that the name of Athanasius was subsequently attached to the creed.

The earliest use of the Quicumque was in sermons, in which the clauses were quoted, as by the council of Toledo without reference to the creed as a whole. From the 8th century, if not from earlier times, commentaries were written on it. The writer of the Oratorian Commentary (Theodulf of Orleans?) addressing a synod which instructed him to provide an exposition of this work on the faith, writes of it, as "here and there recited in our churches, and continually made the subject of utterance," in the 8th century. Angilbert, abbot of St Riquier (c. 814), records that it was sung by his school in procession on rogation days. It passed into the office of Prime, apparently first at Fleury. In the first Prayer Book of Edward VI. it was "sung or said" after the Benedictus on the greater feasts, and this use was extended in the second Prayer Book. In 1662 the rubric was altered and it was substituted for the Apostles' Creed. It has no place in the offices of the Eastern Orthodox Church, but is found, without the words "And the Son" of clause 22, in the appendix of many modern

CREEDS

 Against the Nestorian tendency of the Adoptianists. It is more probable that Leidrad was interested in the growing use of the creed as a canticle, and was consulted in the preparation of the famous Golden Psalter, now at Vienna, which contains the
of as standing on a higher plane than others. In this respect catechisms of modern times, from Luther's down to the recent Evangelical catechism of the Free Churches, and including their various respective points of view both the catechism of the Church of England and the catechism of the council of Trent, are markedly superior to articles and synodal decrees. The failure of the latter was really inevitable. In the 16th century a spirit of universal questioning was rife, and it is this utter unsettlement of opinion which is reflected in the discussions of doubts on matters only remotely connected with "the faith once for all delivered unto the saints" (Jude 3). Moreover, fresh complications arose from the confusion in which the question of the duties and rights of the civil power was entangled. In an age when the foundations of the system on which society had rested for centuries were seriously shaken, such subjects as the right of the magistrate to interfere with the belief of the individual, and the limits of his authority over conscience, naturally assumed a prominence hitherto unknown.

2. Other Lutheran Formularies.—For the purpose of classification it will be convenient to discuss Lutheran, Zwinglian and Calvinistic confessions separately.

An elaborate apology for the Confession of Augsburg was drawn up, by Melanchthon and to Roman Catholic criticisms. This, together with the confession, the articles of Schmalkalden, drawn up by Luther in 1536, Luther's catechisms, and the Formula of Concord which was an attempt to settle doctrinal divisions promulgated in 1580, sum up what is called "the confessional theology of Lutheranism." Of less influence in the subsequent history of Lutheranism, but of interest as used by Archbishop Parker in the preparation of the Elizabethan articles of 1563, is the confession of Württemberg. It was presented to the council of Trent by the ambassador of the state of Württemberg in 1522. Its thirty-five articles contain a moderate statement of Lutheran teaching.

3. Zwinglian and Calvinistic Confessions.—The confession of the Four Cities, Strassburg, Constance, Memmingen and London, was drawn up by M. Bucer and was presented to Charles V. at Augsburg in 1530. These cities were inclined to follow Zwingli in his sacramental teaching which was more fully expressed in the Confession of Basel (1534) and the First Helvetic Confession (1536). Calvin's views were expressed in the Gallican Confession, containing forty articles, which was drawn up in 1555, and translated into French by Francis II. of France and to Charles IX. On the same lines the Dutch Confession of 1561, written by Guido de Brès in French, and translated into Dutch was widely accepted in the Netherlands and confirmed by the synod of Dort (1619). The second Helvetic Confession was the work of Bullinger, published at the request of the Elector Palatine Frederick III. in 1566, and was held in repute in Switzerland, Poland and France as well as the Palatinate. It was sanctioned in Scotland and was well received in England.

These confessions teach the root idea of Calvin's theology, the immeasurable awfulness of God, His eternity, and the immutability of His decrees. Such strict Calvinism was the strength also of the Westminster Confession (see below), but was soon weakened in Germany. This same Elector Frederick invited two young divines, Zacharias Ursinus and Caspar Olevianus, to prepare the afterwards celebrated Heidelberg catechism, which in 1563 superseded Calvin's catechism in the Palatinate. While Calvin began sternly with the question: "What is the chief end of human life?" Ans.: "That may know God and enjoy Him in this world and live forever with Him in heaven." He further asked: "What is the chief end of human life?" Ans.: "That man, with body and soul, both in life and death, is not my own, but belong to my faithful Saviour Jesus Christ." This catechism has been called the charter of the German Reformed Church. It contains three divisions dealing with (1) man's sin, misery, redemption, (2) the Trinity, (3) thankfulness, under which it is included all practical Christian life lived in gratitude for mercies received.

4 Gibson, The Thirty-nine Articles, p. 2.
It shows the influence of Arminian theology against Calvinism, which was vigorously upheld in the *Quin-particular* formula, put forward by the synod of Dort in 1619, to upheld the five points of Calvinism, after heated discussion, in which English divines took part, of the problems of divine omniscience and human free-will.

5. The Westminster Confession (1648), with its two catechisms, is perhaps the ablest of the reformed confessions from the standpoint of Calvinism. Its keynote is sovereignty.

"The Decrees of God are His eternal Purpose according to the Counsel of His Will, whereby for His Own Glory He hath foreordained whatsoever comes to pass."

Man's part is to accept them with submission. As the Anglican divine soon ceased to attend the assembly, and the Independents were few in number, it was the work of Presbyterians only, the Scottish members carrying their proposal to make it an independent document and not a mere revision of the Thirty-Nine Articles. After discussions lasting for two years it was debated in parliament, finished on the 22nd of March 1648, and was adopted by the Scottish parliament in the following year. It is the only confession which has been imposed by authority of parliament on the whole of the United Kingdom. This lasted in England for ten years. In Scotland its influence has continued to the present day. To some little has added the high qualities of religious insight and courage and perseverance which we have honourably distinguished Scottish Presbyterians all the world over. This was the last great effort in constructive theology of the Reformation period. When Cromwell before his death in 1658 allowed a conference to prepare a new confession of faith for the whole commonwealth, the Westminster Confession was accepted as a whole with an added statement on church order and discipline.

We must note, however, that the Baptist divines who were excluded from the Westminster Assembly issued a declaration of their principles under the title, "A Confession of Faith of seven Congregations or Churches in London which are commonly but unjustly called Anabaptists, for the Vindication of the Truth and Information of the Ignorant."

Two other declarations may be quoted to show how necessary such confessions are even to religious societies which refuse to be bound by them. In 1675 Robert Barclay published an "Apology for the Society of Friends," in which he declared what they held concerning revelation, scripture, the fall, redemption, the inward light, freedom of conscience.

In 1683 the Congregational Union published a Declaration of Confession of Faith, Church Order, and Discipline. It was prepared by Dr. George Redford or Worcester, and was presented, not as a scholastic or critical confession of faith, but merely such a statement as any intelligent member of the body might offer as containing its leading principles. It deals with the Bible as the final appeal in controversy, the doctrines of God, man, sin, the Incarnation, the Resurrection of our Lord Jesus Christ, "both the Son of man and the Son of God," the word of the Holy Spirit, justification by faith, the perpetual obligation of Baptism and the Lord's Supper, final judgment, the law of Christian fellowship. Thus principles have been lucidly stated in the Evangelical Free Church catechism.

6. Confessions in the Eastern Orthodox Church.—The Eastern Church has no general doctrinal tests beyond the Nicene Creed, but from time to time synods have approved expositions of the faith such as the Athanasian Creed (without the words "And the Son"), and the Orthodox Confession of the Catholic and Apostolic Eastern Church. This was the work of Petrus Moglias, metropolitan of Kiev, and other theologians. It was written in 1640 in Russian, was translated into Greek, and approved by the council of Jassy and the patriarchs of Constantinople, Alexandria, Antioch and Jerusalem. It was confirmed by the council of Jerusalem in 1672, which also confirmed the Confession of Dosithius, patriarch of Jerusalem. Both of these confessions were drawn up to refute the teaching of a remarkable man who had been patriarch of Constantinople, Cyril Lucar. He was a student of Western theology, a correspondent of Archbishop Laud, and had travelled in Germany and Switzerland. In 1629 he
published a confession in which he attempted to incorporate ideas of the reformers while preserving the leading ideas of Eastern traditional theology. The controversy chiefly turned on the question of the necessity of episcopacy. Dositheus taught that the existence of bishops is as necessary to the Church as "breath to a man and the sun to the world." Christ is the universal and perpetual Head of the Church, but he exercises his rule by means of "the holy Fathers," that is, the bishops whom the Holy Ghost has appointed to be in charge of local churches.

Mention may also be made of the longer catechism of the Orthodox Catholic Church compiled by Philaret, metropolitan of Moscow, revised and adopted by the Russian Holy Synod in 1839. The Church is defined as "a divinely-instituted community of men, united by the orthodox faith, the law of God, the hierarchy and the sacraments."

7. Roman Catholic Formularies.—For our present purpose the distinctive features of Roman Catholicism may be said to be summed up in the decrees of the council of Trent and the creed of Pope Pius IV. The council sat at intervals from 1545–1563, but there was a marked divergence between the opinions advocated by prominent members of the council and its final decrees. Cardinal Pole had to leave the council before it was closed, and the dogma of justification by faith. Even at the later sessions the cardinal of Lorraine was the French prelates supported the German representatives in requests for the cup for the laity, the permission of the marriage of priests, and the revision of the breviary. Finally the decisions of the council were promulgated in a declaration of XII. articles, usually called the Creed of Pius IV., which reaffirmed the Nicene Creed, and dealt with the preservation of the apostolic and ecclesiastical traditions, the interpretation of the Holy Scriptures "according to the sense which our Holy Mother Church has held," the seven sacraments, the offering of the mass, transubstantiation, purgatory, the veneration of saints, relics, images, the efficacy of indulgences, the supremacy of the Roman Church and of the bishop of Rome as vicar of Christ. To this summary of doctrine should be added the dogmas of the immaculate conception of the Blessed Virgin declared in 1854, and of papal infallibility decreed by the Vatican council of 1870.

Conclusion.—In this survey of Christian confessions it has been impossible to do more than barely name many which deserve to be placed under the doctrine of justification in importance and is likely to grow further. The very intensity of that phase of modern thought which declares fervently against all creeds, and would maintain what George Eliot called "the right of the individual to general haziness," is likely to draw all Christian thinkers nearer to one another in sympathy through acceptance of the Apostles' Creed as the common basis of Christian thought. In the words of Hilary of Poitiers, "Faith gathers strength through opposition."

The question at once arises, Can the simple historic faith be maintained without adding theological interpretations, those aid wastes of dogma in which the springs of faith and reverence run dry? The answer is No. We cannot ask to be as if through centuries no one had ever asked a question about the relation of the Lord Jesus Christ to the Father and the Holy Spirit. If we could come back to the Bible and use biblical terms only, as Cyril of Jerusalem wished in his early days, we know from experience that the old errors would reappear in the form of new questions, and that we should have to pass through the dry wilderness of controversy from temple to explicit dogma, from "I believe that Jesus is the Lord" to the confession of the Only Begotten Son is "of one substance with the Father."

In the words of Hilary again:

"Faithful souls would be contented with the word of God which bids us: 'Go teach all nations, baptizing them in the name of the Father and of the Son and of the Holy Ghost.' But also we are drawn by the faults of our heretical opponents to do things unlawful, to scale heights inaccessible, to speak out what is unpalatable, to presume where we ought not. And whereas it is by faith alone that we should worship the Father and reverence the Son, and be filled with the Spirit, we are now obliged to strain our weak human language in the utterance of things beyond its scope; forced into this evil procedure by the evil procedure of our foes. Hence what should be matter of silent religious meditation must now needs be imperilled by exposition in words."

The province of reverent theology is to aid accurate thinking by the use of metaphysical or psychological terms. Its definitions are no more an end in themselves than an analysis of good drinking water, which by itself leaves us thirsty but encourages us to drink. So the Nicene Creed is the analysis of the river of the water of life of which the Sermon on the Mount is a description, flowing on from age to age, freely offered to the thirsty souls of men.

The justification of the ancient creeds carries with it the justification of later confessions so far as they answered questions which would be fatal to religion if they were unanswered. As Principal Stewart puts it very clearly: "The answer given is based on the philosophy or science of the period. It does not necessarily form part of the religion itself, but is the best which with the materials at its command, in its own defence and in its love for truth, the religion (and its advocates) can give. But the answers may be superseded by better answers, or they may be rendered unnecessary because the questions are no longer asked. Thus the Calvinism of the 16th and 17th centuries elaborated answers to questions, which if no attempt had been made to answer them, would have perished earnest souls and condemned the system; but many parts of the system are now obsolete, because the conditions which suggested the questions which they sought to answer no longer exist or have no longer any interest or importance."

CREEK (Mid. Eng. crike or creke, common to many N. European languages), a small inlet on a low coast, an inlet in a river formed by the mouth of a small stream, a shallow narrow harbour for small vessels. In America and Australia especially there are many long streams which can be everywhere forced and sometimes dry up, and are navigable only at their tidal estuaries, mere brooks in width which are of great economic importance. They form complete river-systems, and are the only supply of surface water over many thousand square miles. They are at some seasons a mere chain of "water-holes," but occasionally they are strongly flooded. Since exploration began at the coast and advanced inland, it is probable that the explorers, advancing up the narrow inlets or "creeks," used the same word for the streams which flowed into these as they followed their courses upward into the country. The early settlers would use the same word for that portion of the stream which flowed through their own land, and in Australia particularly the word has the same local meaning as brook in England. On a map the whole system is called a river, e.g. the river Wakefield in South Australia gives...
its name to Port Wakefield, but the stream is always locally called "the creek."

**CREEK or MUSKOGEE (MUSCOGEE) INDIANS** (Algonquin maskoki, "creeks," in reference to the many creeks and rivulets running through their country), a confederacy of North American Indians, who formerly occupied most of Alabama and Georgia. The confederacy seems to have existed in 1540, and then included the Muskogee, the ruling tribe, whose language was generally spoken, the Alabama, the Hitchiti, Koasati and others of the Muskogean stock, with the Yuchi and the Natchez, a large number of Shawano and the Seminoles of Florida as a branch. The Creeks were agriculturists living in villages of log houses. They were brave fighters, but during the 18th century only had one struggle, of little importance, with the settlers. The Creek War of 1813-14 was, however, serious. The confederacy was completely defeated in three hard-fought battles, and the peace treaty which followed involved the cession to the United States government of most of the Creek country. In the Civil War the Creeks were divided in their allegiance and suffered heavily in the campaigns. The so-called Creek nation is now settled in Oklahoma, but independent government virtually ceased in 1906. In 1904 they numbered some 16,000, some two-thirds being of pure or mixed Creek blood.

**CREETOWN**, a seaport of Kirkcudbrightshire, Scotland. Pop. (1901) 901. It is situated near the head of Wigtown Bay, 18 m. W. of Castle Douglas, but 23½ m. by the Portpatrick and Wigtownshire Railway. The granite quarries in the vicinity constitute the leading industry, the stone for the Liverpool docks and other public works having been obtained from them. The village dates from 1785, and it became a borough of barony in 1792. Sir Walter Scott laid part of the scene of *Guy Mannering* in this neighbourhood. Dr Thomas Brown, the metaphysician (1778-1820), was a native of the parish (Kirkmabreck) in which Creetown lies.

**CREEVEY, THOMAS** (1768-1838), English politician, son of William Crewey, a Liverpool merchant, was born in that city in March 1768. He went to Queen's College, Cambridge, and graduated as seventh wrangler in 1789. The same year he became a student at the Inner Temple, and was called to the bar in 1794. In 1802 he entered parliament through the duke of Norfolk's nomination as member for Thetford, and married a widow with six children, Mrs Ord, who had a life interest in a comfortable income. Crewey was a Whig and a follower of Fox, and his active intellect and social qualities procured him a considerable intimacy with the leaders of this political circle. In 1806, when the brief "All the Talents" ministry was formed, he was given the office of secretary to the Board of Control; in 1830, when his party came into power, Crewey, who had lost his seat in parliament, was appointed Lord Grey treasurer of the ordnance; and subsequently Lord Melbourne made him treasurer of Greenwich hospital. After 1818, when his wife died, he had very slender means of his own, but he was popular with his friends and was well looked after by them; Greville, writing of him in 1829, remarks that "old Crewey is a living proof that a man may be perfectly happy and exceedingly poor. I think he is the only man I know in society who possesses nothing.” He died in February 1838. He is remembered through the *Crewey Papers*, published in 1903 under the editorship of Sir Herbert Maxwell, which, consisting partly of Crewey's own journals and partly of correspondence, give a lively and valuable picture of the political and social life of the late Georgian era, and are characterized by an almost Pysian outspokenness. They are a useful addition and correction to the *Croker Papers*, written from a Tory point of view. For thirty-six years Crewey had kept a "copious diary," and had preserved a vast miscellaneous correspondence with such people as Lord Brougham, and his step-daughter, Elizabeth Ord, had assisted him, by keeping his letters to her, in compiling material avowedly for a collection of Crewey Papers in the future. At his death it was found that he had left his mistress, with whom he had lived for four years, his sole execatrix and legatee, and Greville notes in his *Memoirs* the anxiety of Brougham and others to get the papers into their hands and suppress them. The diary, mentioned above, did not survive, perhaps through Brougham's success, and the papers from which Sir Herbert Maxwell made his selection came into his hands from Mrs Blackett Ord, whose husband was the grandson of Crewey's eldest step-daughter.

**CREFRED, or KREFRED**, a town of Germany, in the Prussian Rhine province, on the left side of and 3 m. distant from the Rhine, 32 m. N.W. from Cologne, and 15 m. N.W. from Düsseldorf, with which it is connected by a light electric railway. Pop. (1875) 62,905; (1905) 110,410. The town is one of the finest in the Rhine provinces, being well and regularly built, and possessing several handsome squares and attractive public gardens. A striking point about the inner town is that it forms a large rectangle, enclosed by four wide boulevards or "walls." This feature, rare in German towns, is due to the fact that Crefeld was always an "open place," and that therefore the circular form of a fortress town could be dispensed with. It has six Roman Catholic and four Evangelical churches (of which the Gothic Friedenskirche with a lofty spire, and the modern church of St Joseph, in the Romanesque style, are alone worth special mention); there are a Mennonite and an Old Catholic church. The town hall, decorated with frescoes by P. Jansen (b.1846), and the Kaiser Wilhelm Museum are the most noteworthy secular buildings. In the promenades are monuments to Moltke, Bismarck and Karl Wilhelm, the composer of the *Wacht am Rhein*. Among the schools and scientific institutions of the town the most important is the higher grade technical school for the study of the textile industries, which is attended by students from all parts of the world. Connected with this are subsidiary schools, notably one for dyeing and finishing.

Crefeld is the most important seat of the silk and velvet manufactures in Germany, and in this industry the larger part of the population of town and neighbourhood is employed. There are upwards of 12,000 silk-power-booms in operation, and the value of the annual output in this branch alone is estimated at £3,000,000. A special feature is the manufacture of silk for covering umbrellas; while of its velvet manufacture that of velvet ribbon is the chief. The other industries of the town, notably dyeing, stuff-printing, and carpet-woven, are very considerable, and there are also engineering and machine shops, chemical, cellulose, soap, and other factories, breweries, distilleries and tanneries. The surrounding fertile district is almost entirely laid out in market gardens. Crefeld is an important railway centre, and has direct communication with Cologne, Rheydt, München-Gladbach and Holland (via Zevenaar).

Crefeld is first mentioned in records of the 12th century. From the emperor Charles IV. it received market rights in 1361 and the status of a town in 1373. It belonged to the counts of Mörs, and was annexed to Prussia, with the countship, in 1702. It remained a place of little importance until the 17th century, when religious persecution drove it to a number of Calvinists and Separatists from Jülich and Berg (followed later by Mennonites), who introduced the manufacture of linen. The number of such immigrants still further increased in the 18th century, when, the silk industry having been introduced from Holland, the town rapidly developed. The French occupation in 1795 and the subsequent resumption of trade weighed for a while heavily upon the new industry; but with the termination of the war and the re-establishment of Prussian rule the old prosperity returned.

**CREIGHTON, MANSELL** (1843-1901), English historian and bishop of London, was born at Carlisle on the 5th of July 1843, being the eldest son of Robert Creighton, a well-to-do upholsterer of that city. He was educated at Durham grammar school and at Merton College, Oxford, where he was elected to a postmastership in 1862. He obtained a first-class in *literae humaniores*, and a second in law and modern history in 1866. In the same year he became tutor and fellow of Merton. He was ordained deacon, on his fellowship, in 1870, and priest in 1873; in 1872 he had married Louise, daughter of Robert von Glehn, a London merchant (herself a writer of several successful books of history). Meanwhile he had published several small historical works; but his college and university duties left little time for writing,
and in 1875 he accepted the vicarage of Embleton, a parish on the coast of Northumberland, near Dunstanburgh, with an ancient and beautiful church and a fortified parsonage house, and within reach of the fine library in Bamburgh Keep. Here he remained for nearly ten years, acquiring that experience of parochial work which afterwards stood him in good stead, taking private pupils, studying and writing, as well as taking an active part in diocesan business. Here too he planned and wrote the first two volumes of his chief historical work, the History of the Papacy; and it was in part this which led to his being elected, in 1884, to the newly-founded Dixie professorship of ecclesiastical history at Cambridge, where he went into residence early in 1885. At Cambridge his influence at once made itself felt, especially in the reorganisation of the historical school. His lectures and conversation classes were extraordinarily good, possessing as he did the rare gift of kindling the enthusiasm without curbing the individuality of his pupils. In 1886 he combined with other leading historians to found the English Historical Review, of which he was editor for five years. Meanwhile the vacations were spent at Worcester, where he had been nominated a canon residentiary in 1885. In 1891 he was made canon of Windsor; but he never went into residence, being appointed in the same year to the see of Peterborough. He threw himself with characteristic energy into his new work, visiting, preaching and lecturing in every part of his diocese. He also found time to preach and lecture elsewhere, and to deliver remarkable speeches at social functions; he worked hard with Archbishop Benson on the Parish Councils Bill (1894); he became the first president of the Church Historical Society (1894), and continued in that office till his death; he took part in the Laud Commemoration (1895); he represented the English Church at the coronation of the tsar (1896). He even found time for academic work, delivering the Hulsean lectures (1893–1894) and the Rede lectue (1894) at Cambridge, and the Romanes lecture at Oxford (1896).

In 1897, on the translation of Dr Temple to Canterbury, Bishop Creighton was transferred to London. During Dr Temple's episcopal ritual irregularities of all kinds had grown up, which left a very difficult task to his successor, more especially in view of the growing public agitation on the subject, of which he had to bear the brunt. As was only natural, his studied fairness did not satisfy partisans on either side; and his efforts towards conciliation laid him open to much misunderstanding. His administration, none the less, did much to preserve peace. He strained every nerve to induce his clergy to accept his ruling on the questions of the reservation of the Sacrament and of the ceremonial use of incense in accordance with the archbishop's judgment in the Lincoln case; but when, during his last illness, a prosecutor brought proceedings against the clergy of five recalcitrant churches, the bishop, on the advice of his archdeacons, interposed his veto. One other effort on behalf of peace may be mentioned. In accordance with a vote of the diocesan conference, the bishop arranged the “Roman Table Conference” (1896) in which representatives of various parties, held at Fulham in October 1900, on “the doctrine of the Holy Eucharist and its expression in ritual,” and a report of its proceedings was published with a preface by him. The true work of his episcopate was, however, positive, not negative. He was an excellent administrator; and his wide knowledge, broad sympathies, and sound common sense, though they placed him outside the point of view common to most of his clergy, made him an invaluable guide in correcting their too often indiscreet zeal. He fully realized the special position of the English Church in Christendom, and firmly maintained its essential teaching. Yet he was no narrow Anglican. His love for the English Church never blinded him to its faults, and no man was less insular than he. As he was a historian before he became a bishop, so it was his historical sense which determined his general attitude as a bishop. It was this, together with a certain native taste for ecclesiastical pomp, which made him while condemning the unhistorical extravagances of the ultra-ritualists—himself a ritualist. He was the first bishop of London, since the Reformation, to “pontificate” in a mitre as well as the cope, and though no man could have been less essentially “sacerdotal” he was always careful of correct ceremonial usage. His interests and his sympathies, however, extended far beyond the limits of the church. He took a foremost part in almost every good work in his diocese, social or educational, political or religious; while he found time also to cultivate friendly relations with thinking men and women of all schools, and to help all and sundry who came to him for advice and assistance. It was this multiplicity of activities and interests that proved fatal to him. By degrees the work, and especially the routine work, began to tell on him. He fell seriously ill in the late summer of 1900, and died on the 14th of January 1901. He was buried in St Paul's cathedral, where a statue surmounts his tomb.

He was a man of striking presence and distinguished by a fine courtesy of manner. His irresistible and often daring humour, together with his frank distaste for much conventional religious phraseology, was a stumbling-block to some pious people. But beneath it all lay a deep seriousness of purpose and a firm faith in what to him were the fundamental truths of religion.

Bishop Creighton's principal published works are: History of the Papacy during the Period of the Reformation (5 vols., 1882–1897, new ed.); History of the Papacy from the Great Schism to the Sack of Rome (6 vols., 1897); The Early Renaissance in England (1895); Cardinal Wolsey (1895); Life of Simon de Montfort (1876, new ed. 1895); Queen Elizabeth (1896). He also edited the series of Epochs of English History, for which he wrote “The Age of Elizabeth” (13th ed., 1897); Historical Lectures and Addresses by Mandell Creighton, &c., edited by Mrs Creighton, were published in 1903.

See Life and Letters of Mandell Creighton, &c., by his wife (2 vols., 1904); and the article “Creighton and Stubbs” in Church Quarterly Review for Oct. 1905.

CREIL, a town of northern France, in the department of Oise, 32 m. N. of Paris on the Northern railway, on which it is an important junction. Pop. (1906) 9244. The town is situated on the Oise, on which it has a busy port. The manufacture of machinery, heavy iron goods and nails, and copper and iron founding, are important industries, and there are important metallurgical and engineering works at Montataire, about 2 m. distant; bricks and tiles and glass are also manufactured, and the Northern railway has workshops here. The church (12th to 15th centuries) is in the Gothic style. There are some traces of a castle in which Charles VI. resided during the period of his madness. Creil played a part of some importance in the wars of the 14th, 15th and 16th centuries.

CREIL (or Krell), NICHOLAS (c. 1551–1601), chancellor of the elector of Saxony, was born at Leipzig, and educated at the university of his native town. About 1580 he entered the service of Christian, the eldest son of Augustus I., elector of Saxony, and when Christian succeeded his father as elector in 1586, became his most influential counsellor. Creil's religious views were ante-reformation in style. He was a Calvinist, as were Creighton and Stubbs, and both before and after his appointment as chancellor in 1586 he sought to substitute his own form of faith for the Lutheranism which was the accepted religion of electoral Saxony. Calvinists were appointed to many important ecclesiastical and educational offices; a translation of the Bible with Calvinistic annotations was brought out; and other measures were taken by Creil to attain his end. In foreign politics, also, he sought to change the traditional policy of Saxony, acting in unison with John Casimir, administrator of the Rhenish Palatinate, and promising assistance to Henry IV. of France. These proceedings, coupled with the jealousy felt at Creil's high position and autocratic conduct, made the chancellor very unpopular, and when the elector died in October 1591 he was deprived of his offices and thrown into prison by order of Frederick William, duke of Saxo-Altenburg, the regent for the young elector Christian II. His trial was delayed until 1595, and then, owing partly to the interference of the imperial court of justice (Reichskammergericht), dragged on for six years. At length it was referred by the emperor Rudolph II. to a court.
of appeal at Prague, and sentence of death was passed. This was carried out at Dresden on the 9th of October 1607.

See A. V. Richard, Der kurfürstliche sächsische Kanzer Dr Nicolaus Krell (Frankfort, 1860); B. Bohnenstädt, Das Prozessverfahren gegen den kursächsischen Kanzer Dr. Nikolaus Krell (Halle, 1901); F. Brandos, Der Kanzer Krell, ein Ofter des Orthodoxismus (Leipzig, 1873); and E. T. Henke, Caspar Peucer und Nicolaus Krell (Magdeburg, 1865).

CREMA, a town and episcopal see of Lombardy, Italy, in the province of Cremona, 26 m. N.E. by rail from the town of Cremona. Pop. (1901) town, 8287; commune, 9069. It is situated on the right bank of the Serio, 240 ft. above sea-level, in the centre of a rich agricultural district. The cathedral has a fine Lombard Gothic façade of the second half of the 14th century; the campanile belongs to the same period; the rest of the church has been restored in the baroque style. The clock tower opposite dates from the period of Venetian domination in the 16th and 17th centuries. The castle, which was one of the strongest in Italy, was demolished in 1809. The church of S. Maria, 2 m. E. of the town, was begun in 1490 by Giov. Batt. Battagio; it is in the form of a Greek cross, with a central dome, and the exterior is a fine specimen of polychrome Lombard work (E. Gussalli in Rassegna d'arte, 1905, p. 17).

The date of the foundation of Crema is uncertain. In the 13th century it appears to have been the principal place of the territory known as Isola Fulcheria. In the 14th century it was allied with Milan and attacked by Cremona, but was taken and sacked by Barbarossa in 1160. It was rebuilt in 1185. It fell under the Visconti in 1338, and joined the Lombard republic in 1447; but it was taken by the Venetians in 1449, and, except from 1509 to 1529, remained under their dominion until 1797.

CREMATION (Lat. cremare, to burn), the burning of human corpses. This method of disposal of the dead may be said to have been the general practice of the ancient world, with the important exceptions of Egypt, where bodies were embalmed, Judæa, where they were buried in sepulchres, and China, where they were buried in the earth. In Greece, for instance, so well ascertained was the law that only suicides, uncleaned and persons struck by lightning were denied the right to be burned. At Rome, one of the XII. Tables said, "Hominem mortuam in urbe sepelito, neve usque ad ossa; et in factum, from the cloaca, the sepulchre end of the 4th Christian century, burning on the pyre or roges was the general rule. Whether in any of these cases cremation was adopted or rejected for sanitary or for superstitious reasons, it is difficult to say. Embalming would probably not succeed in climates less warm and dry than the Egyptian. The scarcity of fuel might also be a consideration. The Chinese are influenced by the doctrine of Feng-Shui, or incomprehensible wind water; they must have a properly placed grave in their own land, and with this view their corpses are sent home from long distances abroad. Even the Jews used cremation in the vale of Tophet when a plague came; and the modern Jews of Berin and the Spanish and Portuguese Jews at Mile End cemetery were among the first to welcome the lately revived process. Probably also, some nations had religious objections to the pollution of the sacred principle of fire, and therefore practised exposure, suspension, throwing into the sea, cave-burial, desiccation or envelopment. Some at least of these methods must obviously have been suggested simply by the most natural means at hand. Cremation has also practised over a great part of Asia and America, but not always in the same form. Thus, the ashes may be stored in urns, or buried in the earth, or thrown to the wind, or (as among the Digger Indians) smeared with gum on the heads of the mourners. In one case the processes of embalming, burning and burying are gone through; and in another, if a member of the tribe die at a great distance from home, some of his money and clothes are nevertheless burned by the family. As food, weapons, &c., are sometimes burned with the body, so they are sometimes burned with the body, the whole ashes being collected. The Siamese have a singular institution, according to which, before burning, the embalmed body lies in a temple for a period determined by the rank of the dead man, the king for six months, and so downwards. If the poor relatives cannot afford fuel and the other necessary preparations, they bury the body, but exhume it if for burning when an opportunity occurs.

There can be little doubt that the practice of cremation in modern Europe was at first stopped, and has since been prevented in great measure, by the Christian doctrine of the resurrection of the body; partly also by the notion that the Christian’s body was redeemed and purified. Some clergymen, however, as the late Mr Haweis in his Ashes to Ashes, a Cremation Prelude (London, 1874), have been prominent in favour of cremation. The objection of the clergy was disposed of by the philanthropist Lord Shaftesbury when he asked, "What would in such a case become of the blessed martyrs?" The very general practice of burying bodies in the precincts of a church in order that the dead might take benefit from the prayers of persons resorted to the church, and the religious ceremony which precedes both European burials and American cremations, have been given a religious aspect. It is, however, in the ultimate resort, really a sanitary one. The disgusting results of pit-burial made cemeteries necessary. But cemeteries are equally liable to overcrowding, and are often nearer to inhabited houses than the old churchyards. It is possible, no doubt, to make a cemetery safe approximately by selecting a soil which is dry, close and porous, by careful drainage, and by rigid enforcement of the rules prescribing a certain depth (8 to 10 ft.) and a certain superincumbent body. But a great mass of sanitary objections may be brought against even recent cemeteries in various countries. A dense clay, the best soil for preventing the levitation of gas, is the worst for the process of decomposition. The danger is strikingly illustrated in the careful planting of trees and shrubs to absorb the carbonic acid. Vault-burial in metallic coffins, even when sawdust charcoal is used, is still more dangerous than ordinary burial. It must also be remembered that the cemetery system can only be temporary. The soil is gradually filled with bones; houses round the law itself permits the reopening of graves at the expiry of fourteen years. We shall not, indeed, as Browne says, "be knave out of our graves to have our skulls made drinking bowls and our bones turned into pipes!" But on this ground of sentiment cremation would certainly prevent any interruption of that "sweet sleep and calm rest" which the old prayer that the earth might lie lightly has associated with the grave. And in the meantime we should escape the horror of putrefaction and of the "small cold worm that fretteth the sneshrouded form." In Europe Christian burial was long associated entirely with the ordinary practice of committing the corpse to the grave. But in the middle of the 19th century many distinguished physicians and chemists, especially in Italy, began prominently to advocate cremation. In 1874, a congress called to consider the matter at Milan resolved to petition the Chamber of Deputies for a clause in the new sanitary code, permitting cremation under the supervision of the syndic of the commune. In Switzerland and Dr Veizmann Ercolani was the champion of the cause (see his Cremation the most Rational Method of Disposing of the Dead, 4th ed., Zurich, 1874). So long ago as 1797 cremation was seriously discussed by the French Assembly under the Directory, and the events of the Franco-Prussian War again brought the subject under the notice of the medical press and the sanitary authorities. The military experiments at Sédan, Chalons and Metz, of burying large numbers of bodies with quicklime, or pitch and straw, were not successful, but very dangerous. The matter was considered by the municipal council of Paris in connexion with the new cemetery at Méry-sur-Oise; and the prefect 3

1 Macrobius says it was disused in the reign of the younger Theodosius (Gibbon v. 411).
2 The Colchians, says Sir Thos. Browne, made their graves in the air, i.e., on trees.
3 In the case of a great man there was often a burnt offering of animals and even of slaves (see Caesar, De bell. Gall. iv.).
4 A temple of the Holy Ghost (see Tertullian, De anima, c. 51, cited in Mühr, Lex. des Kirchenrechts, s. v. "Begräbniss".)
of the Seine in 1874 sent a circular asking information to all the cremation societies in Europe. In Britain the subject had slumbered for two centuries, since in 1658 Sir Thomas Browne published his quaint Hydriotaphia, or Urn-Burial, which was mainly founded on the De funere Romanorum of the learned Kirchmannus. In 1817 Dr J. Jamieson gave a sketch of the "Oxford of Cremation" (Proc. Royal Soc. Edin., 1837), and for many years prior to 1874 Dr Lord, medical officer of health for Hampstead, continued to urge the practical necessity for the introduction of the system.

It was Sir Henry Thompson, however, who first brought the question prominently before the public. Thompson's problem was—"Given a dead body, to resolve it into carbonic acid, water and ammonia, rapidly, safely and not unpleasantly." To solve this problem, experiments were made by Dr Polli at the Milan gas works, fully described in Dr Pietra Santa's book, La Crémation des morts en France et à l'étranger, and by Professor Brunetti, who exhibited an apparatus at the Vienna Exhibition of 1873, and who stated his results in La Cremazione dei cadaveri (Padua, 1873). Polli obtained complete incineration or calcination of dogs by the use of coal gas mixed with atmospheric air, applied to a cylindrical refract of retarding clay, so as to consume the gaseous products of combustion. The process was complete in two hours, and the ashes weighed about 5% of the weight before cremation. Brunetti used an oblong furnace of refracting brick with side-doors to regulate the draught, and above a cast-iron dome with movable shutters. The body was placed on a metallic plate suspended on iron wire. The gas generated was escaped by the shutters, and in two hours carbonization was complete. The heat was then raised and concentrated, and at the end of four hours the operation was over; 180 lb of wood costing 2s. 4d. sterling was burned. In a reverberating furnace used by Sir Henry Thompson a body, weighing 144 lb, was reduced in fifty minutes to about 4 lb of lime dust. The noxious gases, which were undoubtedly produced during the first five minutes of combustion, passed through a flute into a second furnace and were entirely consumed. In the ordinary Siemens regenerative furnace (which was adapted by Reclam in Germany for cremation, and also by Sir Henry Thompson) only the hot-blaze was used, the body supplying hydrogen and carbon; or a stream of heated hydrocarbon mixed with heated air was sent from a gasometer supplied with coal, charcoal, peat or wood,—the brick or iron-cased chamber being thus heated to a high degree before cremation begins.

Steps were at once taken to form an English society to promote the practice of cremation. A declaration of its objects was drawn up and signed on the 13th January 1874 by the following persons—Shirley Brooks, William Eassie, Ernest Hart, the Rev. H. R. Hawes, G. H. Hawkins, John Cordy Jeaffreson, F. Lehmann, C. F. Lord, W. Shae, A. Strahan, (Sir) Henry Thompson, Major Vaughan, Rev. C. Voysey and (Sir) T. Spencer Wells; and they frequently met to consider the necessary steps in order to attain their object. The laws and regulations having been thoroughly discussed, the membership of the society was constituted by an annual contribution for expenses, and a subscription to the following declaration:

"We disapprove the present custom of burying the dead, and desire to substitute some mode which shall rapidly resolve the body into its component elements by a process which cannot offend the living, and shall render the remains absolutely innocuous. Until some better method is devised, we desire to adopt that usually known as cremation."

Finally, on 29th April a meeting was held, a council was formed, and Sir H. Thompson was elected president and chairman. Mr Eassie (who in 1875 published a valuable work on Cremation of the Dead) was at the same time appointed honorary secretary.1 In 1875 the following were added:—Mrs Rose Mary Crawshay, Mr Higford Burr, Rev. J. Long, Mr W. Robinson and the Rev. Brooke Lambert. Subsequently followed Lord Branwell, Sir Chas. Cameron, Dr Farquharson, Sir Douglas Galton, Lord Playfair, Mr Martin Ridley Smith, Mr James A. Budgett, Mr Edmund Yates, Mr J. S. Fletcher, Mr J. C. Swithin-Hanham, the duke of Westminster (on Lord Bramwell's death), and Sir Arthur Arnold. These may be considered the pioneers of the movement for reform.

On account of difficulties and prejudices the council was unable to purchase a freehold until 1878, when an acre was obtained at Woking, not far distant from the cemetery. At this time the furnace employed by Professor Gorini of Lodi, Italy, appeared to be the best for working on a small scale; and he was invited to visit England to superintend its erection. This was completed in 1879, and the body of a horse was cremated rapidly and completely without any smoke or effluvia from the chimney. No sooner was this successful step taken than the president received a communication from the Home Office, which resulted in a personal interview with the home secretary; the issue of which was that if the society desired to avoid direct hostile action, an assurance must be given that no cremation should be attempted without leave first obtained from the minister. This of course was given, no further building took place, and the society's labours were confined to employing means to diffuse information on the subject. Sir Spencer Wells brought it before the annual meeting of the British Medical Association in 1880, when a petition to the home secretary for permission to adopt cremation was largely signed by the leading men in town and country, but without any immediate result. The most important event was an application to the council in 1882, by Captain Hanham in Dorsetshire, to undertake the cremation of two deceased relatives who had left express instruction to that effect. The home secretary was applied to, and refused. The bodies were preserved, and Captain Hanham erected a crematorium on his estate, and the cremation took place there. He himself, dying a year later, was cremated also; in both cases the result was attained under the supervision of Mr J. C. Swithin-Hanham, who succeeded Mr Eassie in 1888 as honorary secretary to the society. The government took no notice. But in 1883 a cremation was performed in Wales by a man on the body of his child, and legal proceedings were taken against him. Mr Justice Stephen, in February 1884, delivered his well-known judgment at the Assizes there, declaring cremation to be a legal procedure, provided no nuisance were caused thereby to others. The council of the society at once declared themselves absolved from their promise to the Home Office, and publicly offered to perform cremation, laying down strict rules for careful inquiry into the cause of death in every case. They stated that they were fully aware that the chief practical objection to cremation was that it removed traces of poison or violence which might have caused death. Declining to trust the very imperfect statement generally made respecting the cause of death in the ordinary death certificate (unless a coroner's inquest had been held), they adopted a system of very stringent inquiry, the result of which in each case was to be submitted to the president, to be investigated and approved by him before cremation could take place, with the right to decline or require an inquest if he thought proper; and this course has been followed ever since the first cremation.

It was on 26th March 1885 that the first cremation at Woking took place, the subject being a lady.2 In 1888 it became necessary, nearly 100 bodies having been by this date cremated, to build a large hall for religious service, as well as waiting-rooms, in connexion with the crematorium there. The dukes of Bedford and Westminster headed the appeal for funds, each with £105. The former (the 9th duke of Bedford) especially took great interest in the progress of the society, and offered to furnish further donations to any extent necessary. During the next two years he generously defrayed costs to the amount of £3,500, and built a smaller crematorium adjacent for himself and family.

The latter building was first used on the 18th of January 1891, a few days after the duke's own death. The number of cremations

---

1This was the first society formed in Europe for the promotion of cremation.

2For a full account of these, see Modern Cremation: Its History and Practice to the Present Day, by Sir H. Thompson, Bart., F.R.C.S., &c. (4th ed., Smith, Elder, Waterloo Place, 1901).

3The Times, 27th March 1885.
slowly increased year by year, and the total at the end of
1900 was 18,244. Many of these were persons of distinction—by
rank, or by attainments in art, literature and science, or in
public life.

The council next turned their attention to the need for a
national system of death certification, to be enforced by law as
an essential and much-needed reform in connexion with
cremation. On the 6th of January 1893 the duke of
Westminster introduced a deputation to the secretary
of state for the home department, Mr Asquith, and the
president of the Cremation Society opened the case, showing
that no less than 7% of the burials in England took place without
any certificate, while in some districts it was far greater. In
consequence of this the home secretary appointed a select committee
of the House of Commons, which was presided over by Sir Walter
Foster, of the Local Government Board, to "inquire into the
sufficiency of the existing law as to the disposal of the dead . . .
and especially for detecting the causes of death due to poison,
violence, and criminal neglect." After a prolonged inquiry and
careful consideration of the evidence, a full report and
conclusions drawn therefrom were unanimously agreed to, and
published as a blue-book in the autumn of 1893.1

The following conclusions are quoted from this volume:—Page iii.
" . . . So great an object of public utility and public
security is the detection of it in cases where death may have been due to
poison, or where criminal neglect is concerned, the class of certified
deaths leaves much to be desired." Page iv. Certification is extremely
important as a deterrent of crime, and numerous cases have
demonstrated its efficiency. Page v. There is great uncertainty in repositing
the coroner's evidence on death, and want of system in connexion with the practice of it, are
affirmed to exist. Page vi. It is stated that the opportunity
for perpetrating crime is great in the considerable class of uncertified
cases. In short, the existing procedure plays into the hands of
the criminal classes." Page viii. Your Committee have arrived at the conclusion that the appointment of medical
officials, who should investigate all cases of death which are not certified by a medical practitioner in attendance, is a proposal which
deserves their support.

In considering cremation, the committee reported as follows:—
Page xxii. "Your Committee are of opinion that there is only one
question in connexion with this method of disposing of a dead body
to which it is necessary for them to give attention, and that question
poses itself in the form of the possibility of obtaining evidence of the
cause of death by *post-mortem* examination also disappears." The
mode of proceeding adopted by the Cremation Society of England
having been described, your Committee are of opinion that with the
precautions adopted in connexion with cremation, as carried out by
the Cremation Society, there is little probability that cases of
crime would escape detection, but insomuch as these precautions are
purely voluntary, your Committee consider that in the interests of
public safety such regulations should be enforced by law.

The Cremation Society felt that this report much strengthened the
case for legislation amending the law of death certification.
In August 1894 the president of the society laid the results of
the select committee before the British Medical Association at
Bristol, and a unanimous vote was obtained in favour of the
suggestions made by it. In November a second deputation
waited on Mr Asquith, in which the president of the society
begged him to carry out the system recommended. The
home secretary replied that the business belonged to the department
of the Local Government Board, and that it was already dealing
with the question and bringing it to a satisfactory solution. Soon
afterwards, however, the government changed, other questions
became pressing and further consideration of the subject was
postponed.

With reference to the recommendations of the select committee
before mentioned, the regulations necessary for registration of
death and the disposal of the dead may be outlined as follows:—

3. *A Special Inquiry into the Practice of Interment in Towns,* by
Edwin Chadwick (London, 1843), is replete with evidence, and should
be read by those who desire to pursue the inquiry further.

1 That no body should be buried, cremated, or otherwise disposed
of without a medical certificate of death signed, after personal
knowledge and observation, or by information obtained after in-
vestigation made by a qualified medical officer appointed for the
purpose.
2 A qualified medical man should be appointed as official
certifier in every parish, or district of neighbouring parishes, his duty
being to inquire into all cases of death and report the cause in
writing, together with such other details as may be deemed neces-
sary, to the medical officer of health for the district, and registration
should be made at the office.
3 If the circumstances of death obviously demand a coroner's request, the case should be transferred to his court and
the cause determined, with or without autopsy. If there appears
to be any question as to the ground for the coroner being necessary,
to the furnishing of a certificate, the official certifier should make it,
and state the result in his report.
4 No person or company should be henceforth permitted to construct or use an apparatus for cremat-
ing human bodies without license from the Local Government
Board or other authority.
5 (No crematory should be so employed unless the site, construction, and system of management have been ap-
proved after survey by an officer appointed by government for the
purpose.
6. If the licence to construct or use a crematory should not
be withheld if guarantees are given that the conditions required
are or will be complied with. All such crematories to be subject at
all times to inspection by an officer appointed by the government.
7. The public must be informed of the existence and pur-
poses of an officially recognized crematory, and be warned that
any one who has a body cremated without a certificate of death
should be punished by fine.
8. No human body should be cremated unless the official examiner
added the words "Cremation permitted." This he should be bound
to do if, after due inquiry, he can certify that the deceased has died
from natural causes, and not from ill-treatment, poison or violence.

The Cremation Act 1902 (2 Ed. VII. ch. 8), and the regula-
tions1 made thereunder by the home secretary, have since
given legislative effect to some of the foregoing recommendations
and have laid down a code of laws applicable and binding where
cremation is resorted to. But the amendments in the law of
death certification generally, so long pressed by the Cremation
Society of England and recommended by the select committee,
were not the more that the bill did not come.

Undoubtedly in populous communities and in crowded
districts the burial of dead bodies is liable to be a source of
danger to the living. As early as 1840 a commission had been
appointed, including some of the earliest authorities on sanitary
science,—namely, Drs Southwood Smith, Chadwick, Milroy,
Sutherland, Waller Lewis and others,—to conduct a searching
inquiry into the state of the burial-grounds of London and large
provincial towns. By the report2 the existence of such a danger
was strikingly demonstrated, and intramural interments were in
consequence made illegal. The advocates of burial then declared
that interment in certain light soils would safely and efficiently
decompose the putrefying elements which begin to develop the
moment the body takes place, and which rapidly become
dangerous to the living, still more so in the case of deaths from
contagious disease. But these light dry soils and elevated spots
are precisely those best adapted for human habitation; to say
nothing of their value for food-production. Granted the
efficiency of such burial, it only effects in the course of a few
years the wholesale disposal of a human body; otherwise than in an officially
recognized crematory, should be illegal, and punishable by penalty.

(7) No human body should be cremated unless the official examiner
added the words "Cremation permitted." This he should be bound
to do if, after due inquiry, he can certify that the deceased has died
from natural causes, and not from ill-treatment, poison or violence.

The Cremation Act 1902 (2 Ed. VII. ch. 8), and the regula-
tions1 made thereunder by the home secretary, have since
given legislative effect to some of the foregoing recommendations
and have laid down a code of laws applicable and binding where
cremation is resorted to. But the amendments in the law of
death certification generally, so long pressed by the Cremation
Society of England and recommended by the select committee, were
not the more that the bill did not come.
become in the course of a few hours integral and active elements in some form of vegetable life. The result of this reasoning has been that, by slow degrees, crematoria have been constructed at many populous cities in Great Britain and abroad (see Statistics below).

The subject of employing cremation for the bodies of those who die of contagious disease is a most important one. Sir H. Thompson advocated this course in a paper read before the International Congress of Hygiene held in London in 1891; and a resolution strongly approving the practice was carried unanimously at a large meeting of experts and medical officers of health. Such diseases are small-pox, scarlet fever, diphtheria, consumption, malignant cholera, enteric, relapsing and puerperal fevers, the annual number of deaths from which in the United Kingdom is upwards of 80,000. Complete disinfection takes place by means of the high temperature to which the body is exposed. At the present day it is compulsory to report any case in the foregoing list, whenever it occurs, to the medical officer of health for the district; and it is customary to disinfect the rooms themselves, as well as the clothes and furniture used by the patient if the case be fatal, by 24 hours in a dry and warm chamber, or by exposure to heat and fumes of burning camphor. In some instances a powder of germs, such as is used to with the chances which attend to its preservation in that condition, when buried in a fit or unfit soil or situation.

The process of preparing a body for cremation requires a brief notice. The plan generally adopted is to place it (in the usual shroud) in a light pine shell, discarding all heavy oak or other cofin, and to introduce it into the furnace in that manner. Thus there is no handling or exposure of the body after it reaches the crematorium. The type of furnace in general use is on the reverberatory principle, the body being consumed in a separate chamber heated to over 2000° Fahr. by a coke fire. In a few instances a furnace burning ordinary illuminating gas instead of coke is in use. (H. Th.)

Statistics.—The following statistics show the history of modern cremation and its progress at home and abroad:

Foreign Countries.—The first experiment in Italy was made by Brunetti in 1869, and his second and third in 1870. Gori and Polli published their first cases in 1872. Brunetti exhibited his at Vienna in 1873. His first in France was a single case at Breslau in 1874. Soon after, an English lady was cremated in a closed apparatus (Semenis) at Dresden. The next cremation in a closed receptacle took place at Milan in 1876. In the same year a crematorium in the east end of London was erected, and two Gorini furnaces were at work in 1886. In 1899 the total number of cremations was 1355. In Italy 28 crematoria exist, viz. at Alessandria, Asti, Bologna, Bra, Brescia, Como, Cremona, Genoa, Leghorn, Lodri, Mantua, Milan, Modena, Novara, Padua, Pavia, Pisa, Pistoia, Rome, San Remo, Siena, Spezia, Turin, Udine, Verona and Venice. The total number of cremations in Italy in 1906 was 440.

In October 1887 two men were erected at Gotha; it was opened in 1878, and the total cremations down to September 1st, 1907, numbered 4584. At Ohlsdorf, Hamburg, the crematorium was opened in November 1892, and the total cremations down to September 1st, 1907, numbered 135. At St Gallen, Switzerland, the crematorium was opened in 1891, and the total cremations down to September 1st, 1907, numbered 3741. Throughout the German empire there are, in addition to the above, crematoria at Bremen, Eisenach, Jena, Leipzig, Muhlhausen, Weimar, Zwickau and Stuttgart, besides over eighty societies for promoting cremation. The total number of cremations which took place in Germany in 1906 was 2097, making a total of 13,641 down to September 1st, 1907.

In Denmark, Holland, Belgium, Sweden, Norway and Switzerland. At the crematorium at Copenhagen 77 bodies were cremated in 1906, the total being 500. The Stockholm crematorium was opened in October 1887, and the cremations in 1888 amounted to 50. The Gothenburg crematorium (also in Sweden) was opened in January 1890, and the cremations there in 1906 were 14. Switzerland has four crematoria, viz. at Basel, Geneva, Zurich and St Gallen—524 cremations took place in that year.

In Paris a cremation society was founded in 1880, and in 1880-1887 a large crematorium was constructed by the municipal council at Père La Chaise, containing three Gorini furnaces. It was first used in 1887 for two men who died of small-pox. The demand became large; an improved furnace was soon devised, the unclaimed bodies at the hospitals and the remains at the dissecting rooms being cremated there, besides a large number of embryos. In 1906 the number, including the last-named class, was 6906. The total number of incinerations at Père La Chaise down to December 31st, 1906 (including both classes) was 86,962; but the employment of cremation in the last two years of contagious disease has increased fivefold. Crematories have been established also at Rouen, Rheims and Marseilles, and the construction of crematories in other of the great provincial centres of France was in contemplation.

In the Netherlands there are 13 crematoria, in the bodies of all persons dying of contagious disease are cremated, and there is also a separate establishment for the use of the public. At Tokio in Japan no fewer than 22 crematoria exist, and about an equal number of cremations are performed each year. At Crematorie in Amsterdam, opened in 1906, there were 211 cremations in 1906, 6141. Also at San Francisco, Cal., "Cypress Lawn," opened in 1893, total to December 31st, 1905, 1492. At Los Angeles, Calif., No. 1, Rosesdale, opened in 1897, total to December 31st, 1905, 440. At Oakland, Calif. crematorium opened in 1905, total to December 31st, 1906, 413; No. 3, Gower Street, opened in 1907 with 54 down to September 1st. At Boston, Mass., opened in 1893, total to September 1st, 1907, 2435. At Cincinnati, Ohio, opened in 1897, total to September 1st, 1907, 1375; also in 1907, 1906, 100, opened in 1893, total to September 1st, 1907, 2188. At Detroit, Michigan, opened in 1887, total to December 31st, 1905, 689. At Pittsburg, Penn., opened in 1886, total to September 1st, 1907, 377. At Lancaster, Penn., opened in 1884, total to December 31st, 1905, 106. At Davenport, Iowa, opened in 1891, total to September 1st, 1907, 331. At Milwaukee, opened in 1896, total to October 1905, 442. At Washington, opened in 1897, total to December 31st, 1905, 275. The Lakeview (Chicago, Ill.) crematory, the first in the United States, was erected by Dr F. Julius de Moyne in 1876, for private use. The first cremation was that of the baron de Palino, of New York, December 6th, 1876. Dr. F. Julius de Moyne and his wife were cremated in the above crematory. Total number of cremations (to 1907) 41. At Pasadena, Cal., opened in 1895, total to September 1st, 1907, 491. At St. Paul, Minn., opened in 1897, total to December 31st, 1905, 145. At Fort Wayne, Ind., opened in 1898, total to December 31st, 1907, 144. At Cambridge, Mass., opened in 1900, total to September 1st, 1907, 909. At Cleveland, Ohio, opened in 1901, total to December 31st, 1905, 283. At Denver, Colo., opened in 1904, total to December 31st, 1905, 199. At Indianapolis, Ind., opened in 1899, total to December 31st, 1905, 32. At Chicago, opened in 1902, total to September 1st, 1907, 2156. At Portland, Ore., opened in 1901, total to December 31st, 1905, 327. At Seattle, Washington, opened in 1905, with 21 to the end of that year.

United Kingdom.—There were 13 crematoria in operation in the United Kingdom on September 1st, 1907. The oldest is that at Woking, Surrey, which was first used for the cremation of human beings in 1884, and the total number of cremations in 1905 was 215. It was opened in 1905, and the number gradually increasing each year until 1901 301 bodies were cremated. Up to September 1st, 1907, the total number of cremations at Woking was 2939. Then followed the crematorium at Oxford, opened in 1886, with 1905 1368; at Glasgow, opened in 1895 with 45 in 1905 and a total of 252; at Liverpool, opened in 1896, with 46 in 1906 and a total of 374; at Hull, opened in 1901 (the first municipal crematorium), with 17 in 1903, 1904 and 1905, 13 total in 1906 and a total of 33. The Leicester Corporation crematorium was opened in 1902, with 12 in 1906 and a total of 50. Next in order came the Golders Green crematorium, Hampstead, London, which was opened in December 1905, with 11 in 1906 and a total of 43. At Cambridge, opened in a total of 1901. After this followed the Birmingham crematorium, opened in 1903, with 21 in 1906 and a total of 84; the City of London crematorium, opened in 1905, with 23 for 1906 and a total of 46; the Leeds crematorium, opened in 1905, with 13 in 1906 and a total of 20; and the Sheffield Corporation crematorium, opened in 1905, with
6 in 1906 and a total of 26. There were 730 cremations in the United Kingdom in 1906, making a total at the above crematorium down to September 1st, 1907, of 6185. The Golder's Green crematorium, situated on the northern boundary of Hampstead Heath, stands in its own grounds of 12 acres, and is but 35 minutes' drive from Oxford Circus. London thus has two crematoria within driving distance of its centre, and the Woking crematorium is easily reached from the south-west suburbs.

CREMER, JAKOBUS JAN (1837–1880), Dutch novelist, born at Arnhem in September 1837, started life as a painter, but soon exchanged the brush for the pen. The great success of his first novelles (Betwese Novellen and Overtwete Novellen), published about 1855—reprinted many times since, and translated into German and French—showed Cremer the wisdom of his new departure. These short stories of Dutch provincial life are written in the quaint dialect of the Betuwe, the large flat Gelderland island, formed by the Rhine, the name recalling the presumed earliest inhabitants, the Batavi. Cremer is strongest in his delineation of character. His picturesque humour, coming out, perhaps, most forcibly in his numerous readings of the Betuwe novelles, soon procured him the name of the "Dutch Fritz Reuter." In his later novels Cremer abandons both the language and the characters of the Betuwe, depicting the Dutch life of other centres in the national tongue. The principal are: Anna Roose (1857), Dokter Helmond en zijn Vrouw (1870), Hanna de Freule (1873), Daniel Sils, &c. Cremer was less successful as a playwright, and his two comedies, Peasant and Nobleman and Emma Berkholt, did not enhance his fame; nor did a volume of poems, published in 1873. He died at the Hague in June 1880. His collected novels have appeared at Leiden. An English novel, founded by Albert Vandam upon Anna Roose, considered by many his best work, was published in London (1877, 3 vols.) under the title of An Every-day Heroine.

CREMERA (mod. Fosso della Valletta), a small stream in Etruria which falls into the Tiber about 6 m. N. of Rome. The identification with the Fosso della Valletta is fixed as correct by the account in Livy ii. 49, which shows that the Saxa Rubra were not far off, and this we know to be the Roman name of the post station of Prima Porta, about 7 m. from Rome on the Via Flaminia. It is famous for the defeat of the three hundred Fabii, who had established a fortified post on its banks.

CRÉMIEUX, ISAAC MOISE [known as ADOLPHE] (1766–1880), French statesman, was born at Nimes, of a rich Jewish family. He began life as an advocate in his native town. After the revolution of 1830 he came to Paris, formed connexions with numerous political personages, even with King Louis Philippe, and became a brilliant defender of Liberal ideas in the law courts and in the press—witness his Éloge funèbre of the bishop Grégoire (1830), his Mémoire for the political rehabilitation of Marshal Ney (1833), and his plea for the accused of April (1835). Elected deputy in 1842, he was one of the leaders in the campaign against the Guizot ministry, and his eloquence contributed greatly to the success of his party. On the 24th of February 1848 he was chosen by the Republicans as a member of the provisional government, and as minister of justice he secured the decrees abolishing the death penalty for political offences, and making the office of judge immovable. When the conflict between the Republicans and Socialists broke out he resigned office, but continued to sit in the constituent assembly. At first he, supported with it by a series of galleries, dates from 1827–

Cremora, Luigi (1830–1903), Italian mathematician, was born at Pavia on the 7th of December 1830. In 1848, when Milan and Venice rose against Austria, Cremona, then only a lad of seventeen, joined the ranks of the Italian volunteers, and remained with them, fighting on behalf of his country's freedom, till, in 1849, the capitulation of Venice put an end to the hopeless campaign. He then returned to Pavia, where he pursued his studies at the university under Francesco Brioschi, and determined to seek a career as teacher of mathematics. His first appointment was as elementary mathematical master at the gymnasium and lyceum of Cremona, and he afterwards obtained a similar post at Milan. In 1860 he was appointed to the professorship of higher geometry at the university of Bologna, and in 1866 to that of higher geometry and graphical statics at the higher technical college of Milan. In this same year he competed for the Steiner prize of the Berlin Academy, with a treatise entitled "Memoria sulle superficie di terzo ordine," and shared the award with F. Sturm. Two years later the same prize was conferred on him without competition. In 1873 he was called to Rome to organize the college of engineering, and was also appointed professor of higher mathematics at the university. Cremona's reputation had now become European, and in 1879 he was elected a corresponding member of the Royal Society. In the same year he was made a senator of the kingdom of Italy. He died on the 10th of June 1903.

As early as 1856 Cremona had begun to contribute to the Annali di scienze matematiche e fisiche, and to the Annali di matematica, of which he became afterwards joint editor. Papers by him have appeared in the mathematical journals of Italy, France, Germany and England, and he has published several important works, many of which have been translated into other languages. His manual on Graphical Statics and his Elements of Projective Geometry (translated by C. Leudesdorf), have been published in English by the Clarendon Press. His life was devoted to the study of higher geometry and reforming the more advanced mathematical teaching of Italy. His reputation mainly rests on his Introduzione ad una nuova tecnica delle superfici, which proclaims him as a follower of the Steinerian or synthetic school of geometers. He notably enriched our knowledge of curves and surfaces.

CREMONA, a city and episcopal see of Lombardy, Italy, the capital of the province of Cremona, situated on the N. bank of the Po, 155 ft. above sea-level, 60 m. by rail S.E. of Milan. Pop. (1901) town, 31,655; commune, 39,344. It is oval in shape, and retains its medieval fortifications. The line of the streets is as a rule irregular, but the town as a whole is not very picturesque.

The finest building is the cathedral, in the Lombard Romanesque style, begun in 1107 and consecrated in 1160. The wheel window of the main façade dates from 1274. The transepts, added in the 13th and 14th centuries (before 1370), have picturesque brick façades, with fine terra-cotta ornamentation. The great Torrazzo, a tower 90 ft. high, which stands by the cathedral, and is often associated with it by a series of galleries, dates from 1267–

It is square below, with an octagonal summit of a later period. The main façade of the cathedral was largely altered in 1491, to which date the statues upon it belong; the portico in front was added in 1497. The building would be much improved by isolation, which is hoped may be effected. The interior is fine, and is covered with frescoes by Cremonese masters of the 16th century (Boccaccio Boccaccino, Romanino, Pordenone, the Campi, &c.), which are not of first-rate importance. The choir has fine stalls of 1480–1490, upon one of which there is a view of the façade of the cathedral before its alteration in 1491. The treasury contains a richly worked silver crucifix 9 ft. high, of 1478, the base of which was added in 1774–1775. It contains 408 statues and busts altogether, the central three of which belong to an earlier cross of 1231. Adjacent to the
Cremorne Gardens—Creodontia

cathedral is the octagonal baptistery of 1167, 92 ft. in height and 75 ft. in external diameter, also in the Lombard Romanesque style. The so-called Campo Santo, close to the baptistery, contains a mosaic pavement with emblematic figures belonging probably to the 8th and 9th centuries, and running under the cathedral. Of the other churches, S. Michele has a simple and good Lombard Romanesque 13th-century façade, and a plain interior of the 10th century; and S. Agata a good campanile in the former style. Many of them contain paintings by the later Cremonese masters, especially Galeazzo Campi (d. 1536) and his sons Giulio and Antonio. The latter are especially well represented in S. Sigismondo, 14 m. outside the town to the E. On the side of the Piazza del Comune opposite to the cathedral are two 13th-century Gothic palaces in brick, the Palazzo Comunale and the former Palazzo dei Giureconsulti, now the seat of the commissioners for the water regulation of the district. Another palace of the same period is now occupied by the Archivio Notarile. The modern Palazzo Ponzoni contains a museum and a technical institute. In front of it is a statue of the composer Amilcare Ponchielli, who was a native of Cremona. The Palazzo Fodri, now the Monte di Pietà, has a beautiful 15th-century frieze of terra-cotta bas-reliefs, as have some other palaces in private hands.

Cremona was founded by the Romans in 218 B.C. (the same year as Placentia) as an outpost against the Gallic tribes. It was abandoned in 90 B.C. by the marching of 6000 new settlers and soon became one of the most flourishing towns of upper Italy. It probably acquired municipal rights in 90 B.C., but Augustus, owing to the fact that it did not support him, assigned a part of its territory to his veterans in 41 B.C., and henceforth it is once more called colonia. It remained prosperous (we may note that it was first a school from Mantua) until it was taken and destroyed by the troops of Vespasian after the second battle of Betriacum (Bedriacum) in A.D. 69; the temple of Mefitis alone being left standing (see Tacitus, Hist. iii. 15 seq.). One of the bronze plates which decorated the exterior of the war-chest of the legio III. Macedonica, one of the legions which had been defeated at Betriacum, has been found near Cremona itself (F. Barnabei in Notiz. scavi, 1887, p. 210). Vespasian ordered its immediate reconstruction, but it never recovered its former prosperity, though its position on the N. bank of the Po, at the meeting-point of roads from Placentia, Mantua (the Via Postumia in both cases), Brixellum (where the roads from Cremona and Mantua to Parma met and crossed the river), Laus Pompeii and Brixia, still gave it considerable importance. It was destroyed again by the Lombards under Agilulf in A.D. 605, and rebuilt in 615, and was ruled by dukes; but in the 9th century the bishops of Cremona began to acquire considerable temporal power. Landulf, a German to whom the see was granted by Henry II., was driven out in 1022, and his palace destroyed, but other Germans were invested with the see afterwards. The commune of Cremona is first mentioned in a document of 1089, recording its investiture by the countess Matilda with the territory known as Isola Fulcheria. It had to sustain many wars with its neighbours in order to maintain itself in its new possessions. In the war of the Lombard League against Barbarossa, Cremona, after having shared in the destruction of Crema in 1160 and Milan in 1162, finally joined the league, but took no part in the battle of Legnano, and thus procured itself the odium of both sides. In the Guelph and Ghibelline struggles Cremona took the latter side, and defeated Parma decisively in 1150. It was during this period that Cremona erected its finest buildings. There was, however, a Guelph reaction in 1264; the city was taken and sacked by Henry VII. in 1311, and was a prey to struggles between the two parties, until Galeazzo Visconti took possession of it in 1332. In 1406 it fell under the sway of Carlo I. Fermo, who received with great festivities both under the emperor Sigismond and Pope John XXIII., the latter on his way to the council at Constance; he, however, handed it over to Filippo Maria Visconti in 1419. In 1499 it was occupied by Venetians, but in 1512 it came under Massimiliano Sforza. In 1533, like the rest of Lombardy, it fell under Spanish domination, and was compelled to furnish large money contributions. The population fell to 10,000 in 1668. The surprise of the French garrison on the 2nd of February 1702, by the Imperialists under Prince Eugene, was a celebrated incident of the War of the Spanish Succession. The Imperialists were driven from Cremona after a sharp struggle, but captured Marshal Villeroi, the French commander. Hence the celebrated verse:

"Français, rendons grâce à Bellone; 
Notre bonheur est sans égal; 
Nous avons conservé Crémoneç, 
Et perdu notre général."

In the 18th century the prosperity of Cremona revived. In the Italian republic it was the capital of the department of the upper Po. Like the rest of Lombardy it fell under Austria in 1814, and became Italian in 1859.

See Guida di Cremona (Cremona, 1904).

Cremona, formally a popular resort by the side of the Thames in Chelsea, London, England. Originally the property of the earl of Huntingdon (c. 1750), father of Steele's "Aspasia," who built a mansion here, the property passed through various hands into those of Thomas Dawson, Baron Dartrey and Viscount Cremona (1725-1813), who greatly beautified it. It was subsequently sold and converted into a proprietary place of entertainment, being a popular as such from 1845 to 1877. It never, however, acquired the fashionable fame of Vauxhall, and finally became so great an annoyance to residents in the neighbourhood that a renewal of its licence was refused; and the site of the gardens was soon built over. The name survives in Cremona Road.

Crenelle (an O. Fr. word for "notch," mod. crèneau; the origin is obscure; cf. "cranny"), a term generally considered to mean an embrasure of a battle, but really applying to the whole system of defence by battlements. In medieval times no one could "crenellate" a building without special licence from his supreme lord.

Creodontia, a group of primitive early Tertiary Carnivora, characterized by their small brains, the non-union in most cases of the scapulohumeral and lunar bones of the carpus, and the general absence of a distinct pair of "sectorial" teeth (see Carnivora). In many respects the Lower Eocene creodonts come very close to the primitive ungulates, or Condylarthra (see Phenacodontis), from which, however, they are distinguished by the approximation in the form of the skull to the carnivorous type, the more trenchant teeth (at least in most cases) and the more claw-like character of the terminal joints of the toes. The general character of the dentition in the more typical forms, such as Hyaenodon (see fig.), recalls that of the carnivorous marsupials, this being especially the case with the Patagonian species, which have been separated as a distinct group under the name of Sparassodontia (q.v.). The skull, however, is not of the marsupial type, and in the European forms at any rate there is a complete replacement of the milk-molars by pre-molars, while the minute structure of
the enamel of the teeth is of the carnivorous as distinct from the marsupial type. The head is large in proportion to the body, the lumbar region is unusually rigid, owing to the complexity of the articulations, and the tail and hind-limbs are relatively long and powerful. In life the tail probably passed almost imperceptibly into the body, as in the Tasmanian thylacine.

That the Credontidae are the ancestors of the modern Carnivora is now generally admitted. They are apparently the most generalized and primitive of all (placental?) mammals, and probably the direct descendants of the mammal-like amnodont or theromorphous reptiles of the Triassic epoch; the evolution from that group having perhaps taken place in Africa or in the lost area connecting that continent with India. The relationship of the creodonts to the carnivorous marsupials is not yet determined, but it seems scarcely probable that the remarkable resemblance existing between the teeth of the two groups can be solely due to parallelism; and it has been suggested by Dr L. Wortman that both creodonts and marsupials are descended from a common non-placental stock. In other words, the latter are a side-branch from the amnoodont-creodont line of descent. Dr C. W. Andrews has pointed out that certain of the Egyptian creodonts appear to have been aquatic or subaquatic in their habits; and it is possible that from such types are derived the true aquatic or semi-aquatic Carnivora.

With the exception of Australasia, and possibly South Africa, creodonts (on the supposition that the Patagonian forms are rightly included) appear to have had a nearly world-wide distribution. In Europe and North America they date from the Lowest Eocene and lived till the early Oligocene, while in India they apparently survived till a much later epoch. Some of the Oligocene forms, alike as regards dentition, the union of the scaphoi and lunarp of the ear, and the complexity of the brain, approximated to modern Carnivora.

As regards classification Mr W. D. Matthew includes in the typical family Hyenaodontidae not only the widely spread genera Hyaenodon and Pterodon, but likewise Sinopa (Stypholyphus), Cuonholyndon and Proviverridae; but Viverravus (Didymictis) and Vivulpus (Miocis) are assigned to a separate family (Vivervoridae). It is these latter forms which come nearest to modern Carnivora, and the American and European Oxyaena evidently represents a family by itself, as does the American Oxyaena; and Palaeonictis and Patriofelis are assigned to yet another family; while the North American Lower Eocene and Eocene Arctocyon typifies a family characterized by the somewhat bear-like type of dentition. Mesonyx is also a very distinct type, from the North American and Oligocene. Some of the species of Patriofelis and Hyaenodon attained the size of a tiger, although with long cLit-like skulls. In the earlier forms the claws often remained somewhat of a hoof-like character.

The South American Borhyaenidae include Borhyaena, Prohyalacius, Amphiproviverridae, and allied forms from the Santa Cruz beds of Patagonia, and have been referred to a distinct group, the Sparassodonta, mainly on account of the alleged replacement of some only of the milk-molars by premolars. By their first describer, Dr F. Ameghino, they were regarded as nearly related to the marsupials, to which group they were definitely referred in 1903 by Mr W. J. Sinclair, by whom they are considered near akin to Thylicinus, but this view seems to be disproved by the investigations of Mr C. S. Tomes in the structure of the dental enamel.

It should be added that Dr J. L. Wortman transfers Viverravus and its allies, together with Palaeonictis, to the true Carnivora, the latter genus being regarded as the ancestral type of the sabre-toothed cats (see Machaerodus).

**CREOLE—CREOPHYLUS**

**CREOLE** (the fr. form of criollo, a West Indian, probably a negro corruption of the Span. criadillo, the dim. of criado, one bred or reared, from criar, to breed, a derivative of the Lat. creare, to create), a word used originally (16th century) to denote persons born in the West Indies of Spanish parents, as distinguished from immigrants direct from Spain, aborigines, negroes or mulattos. It is now used of the descendants of non-aboriginal races born and settled in the West Indies, in various parts of the American mainland and in Mauritius, Reunion and some other places colonized by Spain, Portugal, France, or (in the case of the West Indies) by England. In a similar sense the name is used of animals and plants. The use of the word by some writers as necessarily implying a person of mixed blood is totally erroneous; in itself "creole" has no distinction of colour; a creole may be a person of European, negro, or mixed extraction—or even a horse.

Local variations occur in the use of the word as applied to people. In the West Indies it designates the descendants of any European race; in the United States the French-speaking native portion of the white race in Louisiana, whether of French or Spanish origin. The French Canadians are never termed creoles, nor is the word now used of the South Americans of Spanish or Portuguese descent, but in Mexico whites of pure Spanish extraction are still called creoles. In all the countries named, the term negro creole is invariably applied to a person with a relatively large number of negro blood. It is occasionally used to designate the black population, but is also occasionally used of the inhabitants of European descent. The difference in type between the white creoles and the European races from whom they have sprung, a difference often considerable, is due principally to changed environment—especially to the tropical or semi-tropical climate of the lands they inhabit. The many pataos founded on French and Spanish, and used chiefly by creole negroes, are spoken as creole languages, a term extended by some writers to include similar dialects spoken in countries where the word creole is rarely used.

**CREON**, in Greek legend, son of Lycæthus, king of Corinth and father of Glaucæ or Creusa, the second wife of Jason.

**CREON**, in Greek legend, son of Menoeceus, king of Thebes after the death of Laius, the husband of his sister Jocasta. Thebes was then suffering from the visitation of the Sphinx, and Creon offered his heart and the hand of his widowed queen to whoever could solve the riddle. The Sphinx, the son of Laius, ignorant of his parentage, successfully accomplished the task and married Jocasta, his mother. By her he had two sons, Eteocles and Polyníceus, who agreed after their father's death to reign in alternative years. Eteocles first ascended the throne, being the elder, but at the end of the year refused to resign, whereupon his brother attacked him at the head of an army of Argives. The war was to be decided by a single combat between the brothers, but both fell. Creon, who had resumed the government during the minority of Leodamas, the son of Eteocles, commanded that the Argives, and above all Polyníceus, the cause of all the bloodshed, should not receive the rites of sepulture, and that any one who infringed this decree should be buried alive. Antigone, the sister of Polyníceus, refused to obey, and sprinkled dust upon her brother's corpse. The threatened penalty was inflicted; but Creon's crime did not escape unpunished. His son, Haemon, the lover of Antigone, killed himself on her grave; and he himself was slain by Theseus. According to another account he was put to death by Lycus, the son or descendant of a former ruler of Thebes (Euripides, *Bœotia*, ii. 51; Apollodorus iii. 7, 5; Pausanias i. 9, 5).

**CREOPHYLUS** of Samos, one of the earliest Greek epic poets. According to an epigram of Callimachus (quoted in Strabo xiv. p. 638) he was the author of a poem called *Oxhalis Æolus*, which told the story of the conquest of Oechalia by Heracles. Creophostus was said to have been a friend or relative
CREOSOTE—

of Homer, who, according to another tradition, was himself the author of the Ἀκωντος, and presented it to Creophylus in return for the latter's hospitality.

See F. C. Wettstein Du Bueche Cyclos (1865-1882).

CREOSOTE, Creasote or Kresosate (from Gr. κρέας, flesh, and σάπις, to preserve), a product of the distillation of coal, bone oil, shale oil, and wood-tar (more especially that made from beech-wood). The creosote is extracted from the distillate by means of alkali, separated from the filtered alkaline solution by sulphuric acid, and then distilled with dilute alkali; the distillate is again treated with alkali and acid, till its purification is effected; it is then redistilled at 200°C, and dried by means of calcium chloride. It is a highly refractive, colourless, oily liquid, and was first obtained in 1832 by K. Reichenbach from beech-wood tar. It consists mainly of a mixture of phenol, cresol, guaiacol, cresoyal, xylene, dimethyl guaiacol, ethyl guaiacol, and various methyl ethers of pyrogallol. Creosote has a strong odour and hot taste, and burns with a smoky flame. It dissolves sulphur, phosphorus, resins, and many acids and colouring matters; and is soluble in alcohol, ether, and carbon disulphide, and in so large a proportion of water. It is distinguished from carbolic acid by the following properties:—it rotates the plane of polarized light to the right, forms with collodion a transparent fluid, and is nearly insoluble in glycerin; whereas carbolic acid has no effect on polarized light, gives with about two-thirds of its volume of collodion a gelatineous mass, and is insoluble in all proportions in glycerin; further, alcohol and ferric chloride produce with creosote a green solution, turned brown by water, with carbolic acid a brown, and on the addition of water a blue solution. Creosote, like carbolic acid, is a powerful aseptic, and readily coagulates albuminous matter; wood-smoke and pyrogenic acid or wood-vinegar owe to its presence their efficacy in preserving animal and vegetable substances from putrefaction.

CREOSOTE OIL is the name generally applied to the fraction of the coal tar distillate which boils between 200°C and 300°C (see Coal Tar). It is a greenish-yellow, fluorescent liquid, usually containing phenol, cresol, napthalene, anthracene, pyridine, quinoline, acridine and other substances. Its chief use is for the preservation of timber.

Pharmacology and Therapeutics. Creosote derived from wood-tar is given medicinally in doses of from one to five minims, either suspended in mucilage, or in capsules. It should always be administered after a meal, when the gastric contents dilute it and prevent irritation. Creosote and carbolic acid (q.v.) have a very similar pharmacology; but there is one conspicuous exception. Beech-wood creosote alone should be used in medicine, as its composition renders it much more valuable than other creosotes. Its constituents circulate unchanged in the blood and are excreted by the lungs. Although carbolic acid has no value in phthisis (pulmonary tuberculosis) or in any other bacterial condition of the lungs, creosote, having volatile constituents which are excreted in the expired air and which are powerfully antiseptic, may well be of much value in these conditions. In phthisis the phenol, cresol, guaiacol, pyridine, and other substances are excreted. Creosote is now superseded by both its carbonate (creosotal)—given in the same doses—which causes less gastric disturbance, and by guaiacol itself, which may be given in doses up to thirty minims in capsules. The phosphate (phosote or phosphate), phosphite (phosphatal), and valerianate (cosote) also find application. Similarly the carbonate of guaiacol may be given in doses even as large as a dram. Creosote may also be used as an inhalation with a steam atomizer. It is applicable not only in phthisis but in bronchiectasis, bronchitis, broncho-pneumonia, lobar pneumonia and all other bacterial lung diseases. Like carbolic acid, creosote is used in toothache, and the local antiseptic and anaesthetic action which it shares with that substance is often of value in relieving gastric pain due to simple ulcer or cancer, and in those forms of vomiting which are due to gastric irritation.

CREPUSSULAR (from Lat. crepusculum, twilight), or belonging to the twilight, hence indistinct or glimmering; in zoology the word is used of animals that appear before sunrise or nightfall.

CREQUY, a French family which originated in Picardy, and took its name from a small lordship in the present Pas-de-Calais. Its genealogy goes back to the 10th century, and from it originated the noble houses of Blécourt, Canepal, Heilly and Royen. Henri de Créquy was killed at the siege of Damietta in 1240; Jacques de Créquy, marshal of Guienne, was killed at Agincourt with his brothers Jean and Raoul; Jean de Créquy, lord of Canepal, was in the Burgundian service, and took part in the defence of Paris against Jean of Arc in 1429; received the order of the Golden Fleece in 1431, and was ambassador to Aragon and France; Antoine de Créquy was one of the boldest captains of Francis I, and died in consequence of an accident at the siege of Hesdin in 1523. Jean VIII, sire de Créquy, prince de Poix, seigneur de Canaples (d. 1555), left three sons, the eldest of whom, Antoine de Créquy (1535-1574), inherited the family estates on the death of his brothers at St Quentin in 1557. He was raised to the cardinalate, and his nephew and heir, Antoine de Blanchefort, assumed the name and arms of Créquy. Charles I. de Blanchefort, marquis de Créquy, prince de Poix, due de Lesdiguières, was the youngest son of the last-named, saw his first fighting before Laon in 1594, and was wounded at the capture of Saint Jean d'Angély in 1621. In the next year he became a marshal of France. He served through the Piedmontese campaign in aid of Savoy in 1624 as second in command to the constable, François de Bonne, duc de Lesdiguières, whose daughter Madeleine he had married in 1595. He inherited in 1626 the estates and title of his father-in-law, who had induced him, after the death of his first wife, to marry her half-sister Françoise. He was also lieutenant-general of Dauphiné. In 1633 he was ambassador to Rome, and in 1636 to Venice. He fought in the Italian campaigns of 1630, 1635, 1636 and 1637, when he helped to defeat the Spaniards at Monte Baldo. He was killed on the 17th of March 1638 in an attempt to raise the siege of Crema, a fortress in the Milanese. He had a quarrel extending over years with Philip, the bastard of Savoy, which ended in a duel fatal to Philip in 1599; and in 1620, during the war against the French, he was himself sent in war, against a prosecution threatened by Louis XIII. Some of his letters are preserved in the Bibliothèque Nationale in Paris, and his life was written by N. Chorier (Grenoble, 1683).

His eldest son, François, comte de Sault, duc de Lesdiguières (1600-1677), governor and lieutenant-general of Dauphiné, took the name and arms of Bonne. The younger, Charles II. de Créquy, seigneur de Canaples, was killed at the siege of Chambéry in 1630, leaving three sons—Charles III, sire de Blanchefort, prince de Poix, duc de Créquy (1623-1687); Alphonse de Créquy, comte de Canaples (d. 1711), who became on the extinction of the elder branch of the family in 1702 duc de Lesdiguières, and eventually succeeded also to his younger brother's honours; and François, chevalier de Créquy and marquis de Marines, marshal of France (1625-1687).

The last-named was born in 1625, and as a boy took part in the Thirty Years' War, distinguishing himself so greatly that at the age of twenty-six he was made a marshal de camp, and a lieutenant-general before he was thirty. He was regarded as the most brilliant of the younger officers, and won the favour of Louis XIV, by his fidelity to the court during the second Fronde. In 1667 he served on the Rhine, and in 1668 he commanded the covering army during Louis XIV's siege of Lille, after the surrender of which the king rewarded him with the marshalate. In 1670 he overran the duchy of Lorraine. Shortly after this Turenne, his old commander, was made marshal-general, and all the marshals were placed under his orders. Many resented this, and Créquy, in particular, whose career of uninterrupted success had made him over-confident, went into exile rather than serve under Turenne. After the death of Turenne and the retirement of Condé, he became the most important general officer in the army, but his over-confidence was punished.***
CRÉQUY, MARQUISE DE—CRESCIMBENI

by the severe defeat of Conzerv Brück (1675) and the surrender of Trier and his own captivity which followed. But in the later campaigns of this war (see Dutch Wars) he showed himself again a cool, daring and successful commander, and, carrying on the tradition of Turenne and Condé, he was in his turn the pattern of the younger generals of the stamp of Luxembourg and Condé. He was in fact the last of the Parisian commanders.

Alphonse de Créquy had not the talent of his brothers, and lost his various appointments in France. He went to London in 1672, where he became closely allied with Saint-Evremont, and was one of the intimates of King Charles II.

Charles III. de Créquy served in the campaigns of 1642 and 1645 in the Thirty Years' War, and in Catalonia in 1649. In 1646, after the siege of Orbitalo, he was made lieutenant-general by Louis. By faithful service during the king's minority he had won the gratitude of Anne of Austria and of Mazarin, and in 1652 he became duc de Créquy and a peer of France. The latter half of his life was spent at court, where he held the office of first gentleman of the royal chamber, which had been bought for him by his grandfather. In 1659 he was sent to Spain with gifts for the infant Maria Theresa, and on a similar errand to Bavaria in 1660 before the marriage of the dauphin. He was ambassador to Rome from 1666 to 1669, and, arrested in 1677, and became governor of Paris in 1675. He died in Paris on the 13th of February 1687, his only daughter, Madeleine, married Charles de la Trémoille (1655-1709).

The marshal François de Créquy had two sons, whose brilliant military abilities bade fair to rival his own. The elder, François Joseph, marquis de Créquy (1662-1702), already held the grade of lieutenant-general when he was killed at Luzzara on the 13th of August 1702; and Nicholas Charles, sire de Créquy, was killed before Tournai in 1695 at the age of twenty-seven.

A younger branch of the Créquy family, that of Hémont, was represented by Louis Marie, marquis de Créquy (1705-1741), author of the Principes philosophiques des saints solitaires d'Égypte (1779), and husband of the marquise separately noticed below, and became extinct with the death in 1801 of his son, Charles Marie, who had some military reputation.

For a detailed genealogy of the family and Its alliances see Moret, Dictionnaire historique; Annuaire de la noblesse française (1856 and 1867). There is much information about the Créquys in the Mémoires of Saint-Simon.

CRÉQUY, RENÉE CAROLINE DE FROULLAY, MARQUISE DE (1714-1803), was born on the 10th of October 1714, at the château of Monfeaux (Mayenne), the daughter of Lieutenant-General Charles François de Froullay. She was educated by her maternal grandmother, and married in 1737 Louis Marie, marquis de Créquy (see above), who died four years after the marriage. Madame de Créquy devoted herself to the care of her only son, who rewarded her with an ingratitude which was the chief sorrow of her life. In 1735 she began to receive in Paris, among her intimates being D'Alembert and J. J. Rousseau. She had none of the frivolity generally associated with the women of her time and class, and presently became extremely religious with inclinations to Jansenism. D'ALEMBERT'S visits ceased when she adopted religion, and she was nearly seventy when she formed the great friendship of her life with Sénac de Meilhan, whom she met in 1781, and with whom she carried on a correspondence (edited by Édouard Fournier, with a preface by Sainte-Beuve in 1856). She commented on and criticized Meilhan's works and helped his reputation. She was arrested in 1793 and imprisoned in the convent of Les Oiseaux until the fall of Robespierre (July 1794). The well-known Souvenirs de la marquise de Créquy (1710-1803), printed in 7 volumes, 1834-1835, and purporting to be addressed to her grandson, Tancrède de Créquy, was the production of a Breton adventurer, Cousin de Courchamps. The first two volumes appeared in English in 1834 and were severely criticized in the Quarterly Review.

CREScas, Hasdai ben Abraham (1340-1410), Spanish philosopher. His work, The Light of the Lord (Or 'Adonai), deeply affected Spinoza, and thus his philosophy became of wide importance. Maimonides (q.v.) had brought Jewish thought entirely under the domination of Aristotle. The work of Crescas, though it had no immediate success, ended in effecting its liberation. He refused to base Judaism on speculative philosophy alone; there was a deep emotional side to his thought. Thus he based Judaism on love, not on knowledge; love was the bond between God and man, and man's fundamental duty was love as expressed in obedience to God's will. Spinoza derived from Crescas his distinction between attributes and properties; he shared Crescas's views on creation and free will, and in the whole trend of his thought the influence of Crescas is strongly marked. See E. G. Hirsch, Jewish Encyclopedia, iv. 350. (I. A.)

CRESCENT (Late, crescent, growing), originally the waxing moon, hence a name applied to the shape of the moon in its first quarter. The crescent is employed as a charge in heraldry, with its horns vertical; when they are turned to the dexter side of the shield, it is called increscent, when to the sinister, decrescent. A crescent is used as a difference to denote the second son of a house; thus the earls of Harrington place a crescent upon a crest, as descending from the second son of a second son. Crescent is the name of the 16th, 17th, and 18th kings of France, and of the 15th and 17th dukes of Orleans. The crescent is also the emblem of the 17th regiment of dragoons, and of the 16th regiment of dragoons. The crescent, however, was really no symbol of the Ottoman Turks. According to the story told by Hesychius of Miletus, during the siege of Byzantium by Philip of Macedon the moon suddenly appeared, the dogs began to bark and aroused the inhabitants, who were thus enabled to frustrate the enemy's scheme of undermining the walls. The grateful Byzantines erected a statue to "torch-bearing" Hecate, and adopted the lunar crescent as the badge of the city. It is generally supposed that it was in turn adopted by the Turks after the capture of Constantinople in 1455, either as a badge of triumph, or to commemorate a partial eclipse of the moon on the night of their victory. In any case it seems to have been long before that event. Ala ud-din, the Seljuk of Iconium (1254-1255), and Erteqooglu, his lieutenant and the founder of the Ottoman branch of the Turkish race, assumed it as a device, and it appeared on the standard of the janissaries of Sultan Orkhan (1326-1356). Since the new moon is associated with special acts of devotion in Turkey—where, as in England, there is a popular superstition that it is unlucky to see it through glass—it may originally have been adopted in consequence of its religious significance. According to Professor Ridgway, however, the Turkish crescent, like that seen on modern horse-trappings, has nothing to do with the new moon, but is the result of the base-to-base conjunction of two claw or tusk amulets, an example of which has been brought to light during the excavations of the site of the temple of Artemis Orthia at Sparta (see Athenaeum, March 21, 1908). There is nothing distinctively Turkish in the combination of crescent and star which appears on the Turkish national standard; the latter is shown by coins and inscriptions to have been an ancient Illyrian symbol, and is of course common in knightly and decorative orders. It is doubtful whether any opposition between crescent and cross, as symbols of Islam and Christianity, was ever intended by the Turks; and it is an historical error to attribute the crescent to the Saracens of crusading times or the Moors in Spain.

Crescent is also the name of a Turkish musical instrument. In architecture, a crescent is a street following the arc of a circle; the name in this sense was first used in the Royal Crescent at Bath.

CRESCHMENI, Giovanni Mario (1666-1728), Italian critic and poet, was born at Macerata in 1666. Having been educated by a French priest at Rome, he entered the Jesuits' college of his native town, where he produced a tragedy on the
story of Darius, and versified the Pharsalia. In 1670 he received the degree of doctor of laws, and in 1680 he removed again to Rome. The study of Filicaja and Leonico having convinced him that he and all his contemporaries were working in a wrong direction, he resolved to attempt a general reform. In 1690, in conjunction with fourteen others, he founded the celebrated academy of the Arcadian, and began the contest against false taste and its adherents. The academy was most successful; branch societies were opened in all the principal cities of Italy; and the influence of Marinii, opposed by the simplicity and elegance of such models as Costanzo, soon died away. Crescimbeni officiated as secretary to the Arcadians for thirty-eight years. In 1703 he was made canon of Santa Maria; in 1715 he obtained the chief curacy attached to the same church; and about two months before he died (1728) he was admitted a member of the order of Jesus.

His principal work is the Istoria della volgar poesia (Rome, 1698), an estimate of all the poets of Italy, past and contemporary, which may yet be consulted with advantage. The most important of his numerous other publications are the Commentarii (5 vols., Rome, 1702-1711), and La Bellezza della volgar poesia (Rome, 1700).

CRESILAS, a Cretan sculptor of Cydonia. He was a contemporary of Theodas, and one of the sculptors who vied in producing statues of amazons at Ephesus (see Greek Art) about 100 B.C. As his amazons were wounded (Pliny, Nat. Hist. xxxiv. 75) he may safely identify it with the figure, of which several copies are extant, who is carefully removing her blood-stained garment from a wound under the right breast.

Another work of Cresilas of which copies survive is the portrait of Pericles, the earliest Greek portrait which has been with certainty identified, and which fully confirms the statement of ancient critics that Cresilas was an artist who idealized and added nobility to men of noble type. An extant portrait of Anacreon is also derived from Cresilas.

CRESOLS or METHYL PHENOLS, C₆H₅OH or C₆H₅-CH₂-OH.
The three isomeric cresols are found in the tar obtained in the destructive distillation of coal, beech-wood and pine. The crude cresol obtained from tar cannot be separated into its different constituents by fractional distillation, since the boiling points of the three isomers are very close together. The pure substances are best obtained by fusion of the corresponding tolouene sulphonated acids with caustic alkali.Ortho-cresol, C₆H₅(1)-C₆H₅-OH(1), occurs as sulphate in the urine of the horse. It may be prepared by fusion of ortho-toluene sulphonated acid with potash; by the action of phosphoric pentoxide on carbazole; or by the action of zinc chloride on camphor. It is a crystalline solid, which melts at 30° C. and boils at 190-8° C. Fusion with alcalis converts it into salicylic acid.

Meta-cresol, C₆H₅(1)-C₆H₅-OH(3), is formed when thymol (para-isopropyl-meta-cresol) is heated with phosphorus pentoxide. Propylene is liberated during the reaction, and the phosphoric acid ester of meta-cresol which is formed is then fused with potash. It can also be prepared by distilling meta-oxyvitic acid with lime, or by the action of air on boiling toluene in the presence of aluminium chloride (C. Friedel and J. M. Crafts, Ann. Chim. Phys., 1888 [6], 14, p. 436). It solidifies in a freezing mixture, on the addition of a crystal of phenol, and then melts at 3°-4° C. It boils at 203-8° C. Its aqueous solution is coloured blue-violet by ferric chloride.

Para-cresol, C₆H₅(1)-C₆H₅-OH(2), occurs as sulphate in the urine of the horse. It is also found in horse's liver, being one of the putrefaction products of tyrosine. It may be prepared by the fusion of para-toluene sulphonated acid with potash; by the action of nitrous acid on para-toluidine; or by heating para-oxynaphthyl acetic acid with lime. It crystallizes in prisms which melt at 36° C. and boil at 203°-8 C. It is soluble in water, and the aqueous solution gives a blue colouration with ferric chloride. When treated with hydrochloric acid and potassium chloride, no chlorinated quinones are obtained (M. S. Southworth, Ann. (1875), 168, p. 271), a behaviour which distinguishes it from ortho- and meta-cresol.

On the composition of commercial cresylic acid see A. H. Allen, Jour. Soc. Chem. Industry (1890), 9, p. 141. See also CREBOSITE.

CRESPI, DANIELE (1500-1630), Italian historical painter, was born near Milan, and studied under Giovanni Battista Crespi and Giulio Pracchini. He was an excellent colourist; his drawing was correct and vigorous, and he grouped his compositions with much ability. His best work, a series of pictures from the life of Saint Bruno, is in the monastery of the Carthusians at Milan. Among the most famous of his paintings is a "Stoning of St Stephen" at Brera, and there are several excellent examples of his work in the city of his birth and at Pavia.

CRESPI, GIOVANNI BATTISTA (1557-1663), called II Cerano, Italian painter, sculptor, and architect, was born at Cerano in the Milanese. He was a scholar of considerable attainments, and held a position of dignity in his native city. He was head of the Milanese Academy founded by Cardinal Frederigo Borromeo, and he was the teacher of Guarino. He is most famous as a painter; and, though his figures are neither natural nor graceful, his colouring is good, and his designs full of ideal beauty.

CRESPI, GIUSEPPE MARIA (1665-1747), Italian painter, called "Lo Spagnuolo" from his fondness for rich apparel, was born at Bologna, and was trained under Angelo Torni, Domenico Canuti and Domenico Cignani. He then went through a course of copying from Correggio and Barocci; this he followed up with a journey to Venice for the sake of Titian and Paul Veronese; and late in life he proclaimed himself a follower of Guarino and Pietro da Cortona. He was a good colourist and a facile executant, and was wont to employ the camera obscura with great success in the treatment of light and shadow; but he was careless and unconscientious. He was a clever portrait-painter and a brilliant caricaturist; and his etchings after Rembrandt and Salvator are in some demand. His greatest work, a "Massacre of the Innocents," is at Bologna; but the Dresden gallery possesses twelve examples of him, among which is his celebrated series of the Seven Sacraments.

CRESS, in botany, "Garden Cress" (Lepidium sativum) is an annual plant (nat. ord. Cruciferae), known as a cultivated plant at the present day in Europe, North Africa, western Asia and India, but its origin is obscure. Alphonse de Candolle (L'Origine des plantes culinaires) says its cultivation must date from ancient times and be widely diffused, for very different names for it exist in the Arab, Persian, Albanian, Hindustani and Bengali tongues. He considered the plant to be of Persian origin, whence it may have spread after the Sanskrit epoch (there is no Sanskrit name for it) into the gardens of India, Syria, Greece and North Africa. It is used in salads, the young plants being cut and eaten while still in the seed-leaf, forming, along with plants of the white mustard in the same stage of growth, what is commonly called "small salad." The seeds should be sown thinly broadcast or in rows in succession every ten or fourteen days, according to the demand. The sowings may be made in the open ground from March till October, the earliest under hand-glasses, and the summer ones in a cool moist situation, where water from trees, shrubs, walls, &c., cannot fall on or near them. The grit thrown up by falling water pierces the tender tissues of the cress, and cannot be thoroughly removed by washing. During winter they must be raised in slight boxes, or in shallow boxes or pans placed in any of the glass-houses where there is a temperature of 60° or 65°. Cress is subject to the attack of a fungus (Pythium de Baryanum) if kept too close and moist. The pest very quickly infects a whole sowing. There is no cure for it; preventive measures should therefore be taken by keeping the sowings fairly dry and well ventilated. The seed should be sown on new soil, and should not be covered.

The "Golden" or "Australian" cress is a dwarf, yellowish-green, mild-flavoured sort, which is cut and eaten when a little more advanced in growth but while still young and tender. It should be sown at intervals of a month from March onwards, the autumn sowing, for winter and spring use, being made in a sheltered situation. The "curled" or "Normandy" cress is a very hardy sort, of good flavour. In this, which is allowed to grow like parsley, the leaves are picked for use while young; and, being finely cut
and curled, they are well adapted for garnishing. It should be sown thinly, in drills, in good soil in the open borders, in March, April and May, and for winter and spring use at the foot of a south wall early in September, and about the middle of October. Water-cress.—“Water-cress” (Nasturtium officinale) is a member of the same natural order, and a native of Great Britain. Although now so largely used, it does not appear to have been cultivated in England prior to the 19th century, though in Germany, especially near Erfurt, it had been grown long previously. Its flavour is due to an essential oil containing sulphur. Water-cress is largely cultivated in shallow ditches, prepared in wet, low-lying meadows, means being provided for flooding the ditches at will. Where the amount of water available is limited, the ditches are arranged at successively higher levels, so as to allow of the volume admitted to the upper ditch being passed successively to the others. The ditches are usually puddled with clay, which is covered to the depth of 6 to 12 in. with well-manured soil.

A stock of plants may be raised in two ways—by cuttings, and by seeds. If a stock is to be raised from cuttings, the desired quantity of young shoots is gathered—those sold in bunches for sale afford the purpose well—and reduced where necessary to about 3 in. in length, the basal and frequently root portion being rejected. They are dibbled thickly into the ditches, and only enough cuttings to just cover the soil. If the weather is made in late spring, the cuttings will be rooted in a week. They are allowed to remain for another week or two, and are then up and dropped about 6 in. apart into the other ditches, which have been slightly flooded to receive them. There is no need to plant them—the young roots will very soon be securely anchored. The volume of water is increased as the plants grow. If raised from seed, the seed-bed is prepared as for cuttings, and seed sown either in drills or broadcast. No flooding is done until the seedlings are up. Water is then admitted, the level being raised as the plants grow. When 5 or 6 in. high, they are taken up and dropped into their permanent quarters precisely like those raised from cuttings.

Cultivated as above described, the plants afford frequent cuttings of large clean cress of excellent flavour for market purposes. Sooner or later growth will become less vigorous and flowering shoots will be produced. This will be accompanied by a pronounced deterioration of the remaining vegetative shoots. These signs will be interpreted by the grower to signify the necessity for renewal of the plants, as a market crop, and therefore for the purpose of guaranteeing an abundance of water-cress throughout the year, the best-flavoured water-cress is produced in the pure water of running streams over chalk or gravel soil. Should the water be contaminated by sewage or other undesirable matter, the plants not only absorb some of the impurities but also serve to anchor much of the solid particles washed as scum among them. This is extremely difficult to dislodge by washing, and renders the cress a source of danger as food.

Water-cress for domestic use may be raised as a kitchen-garden crop if frequently watered overhead. Beds to afford cress during the summer should be made in broad trenches on a border facing north. It may also be raised in pots or pans stood in saucers of water and frequently watered overhead.

In recent years in America attention has been paid to the injury done to water-cress beds by the “water-cress sow-bug” (Mancesus brachyurus), and the “water-cress leaf-beetle” (Phaedon aeruginosa). Another species of Phaedon is known in England as “blue beetle” or “mustard beetle,” and is a pest also of mustard, cabbage and kohlrabi (see F. H. Chittenden, in Bulletin 66, part ii, of Bureau of Entomology, United States Department of Agriculture, 1907).

The name “nasturtium” is applied in gardens, but incorrectly, to species of Tropaeolum.

CRESSENT, CHARLES (1685–1768), French furniture-maker, sculptor and fondateur-ciseleur. As the second son of François Cresent, sculpteur du roi, and grandson of Charles Cresent, a furniture-maker of Amiens, who also became a sculptor, he inherited the tastes and aptitudes which were likely to make a finished designer and craftsman. Even more important perhaps was the fact that he was a pupil of André Charles Boule. Trained in such surroundings, it is not surprising that he should have reached a degree of achievement which has to a great extent justified the claim that he was the best decorative artist of the 18th century. Cresent’s distinction is closely connected with the regency, but his earlier work had affinities with the school of Boule, while his later pieces were full of originality. He was an artist in the widest sense of the word. He not only designed and made furniture, but created the magnificent gilded enrichments which are so characteristic of his work. He was likewise a sculptor, and among his plastic work is known to have been a bronze bust of Louis, duc d’Orléans, the son of the regent, for whom Cresent had made one of the finest examples of French furniture of the 18th century—the famous médaillier now in the Bibliothèque Nationale. Cresent’s bronze mounts were executed with a sharpness of finish and a grace and vigour of outline which were hardly excelled by his great contemporary Jacques Caffieri. His female figures placed at the corners of tables are indeed among the most delicious achievements of the great days of the French metal workers. Much of Cressent’s furniture of pre-1760 date is in the Wallace collection and the Wallace collection are especially rich in it, and his commode at Hertford House with gilt handles representing Chinese dragons is perhaps the most elaborate piece he ever produced. The work of identification is rendered comparatively easy in his case by the fact that he published catalogues of three sales of his work. These catalogues are highly characteristic of the man, who shared in no small degree the personal bravura of Cellini, and could sometimes execute almost as well. He did not hesitate to describe himself as the author of “a clock worthy to be placed in the very finest cabinets,” the most distinguished bronzes, or pieces of “the most elegant form adorned with bronzes of extra richness.” He worked much in marqueterie, both in tortoiseshell and in brilliant coloured woods. He was indeed an artist to whom colour appealed with especial force. The very type and exemplar of the “feeling” of the regency, he is worthy to have given his own name to some of the fashions which he deduced from it.

CRESSWELL, SIR CRESSWELL (1794–1863), English judge, was a descendant of an old Northumberland family, and was born at Newcastle in 1794. He was educated at the Charterhouse and at Emmanuel College, Cambridge. He graduated B.A. in 1814, and M.A. four years later. Having chosen the profession of the law he studied at the Middle Temple, and was called to the bar in 1819. He joined the northern circuit, and was not long in earning a distinguished position among his professional brethren. In 1837 he entered parliament as Conservative member for Liverpool, and he soon gained a reputation as an acute and learned debater on all constitutional questions. In January 1842 he was made a judge of the court of common pleas, being knighted at the same time; and this post he occupied for sixteen years. When the new court for probate, divorce and matrimonial causes was established (1858), Sir Cresswell Cresswell was requested by the Liberal government to become its first judge and undertake the arduous task of its organization. Although he had already earned a right to retire, and possessed large private wealth, he accepted this new task, and during the rest of his life devoted himself to it most assiduously and conscientiously, with complete satisfaction to the public. In one case only, out of the very large number on which he pronounced judgment, was his decision reversed. His death was sudden. By a fall from his horse on the 11th of July 1863 his knee-caps was injured. He was recovering from this when on the 20th of the same month he died of disease of the heart.

See Foss’s Lives of the Judges; E. Manson, Builders of our Law (1904).

CRESSY, HUGH PAULINUS DE (c. 1605–1674), English Benedictine monk, whose religious name was Serenus, was born at Wakefield, Yorkshire, about 1605. He went to Oxford at the age of fourteen, and in 1626 became a fellow of Merton College. Having taken orders, he rose to the dignity of dean of Leighin,
CREST—CRETACEOUS SYSTEM

Ireland, and canon of Windsor. He also acted as chaplain to Lord Wentworth, afterwards the celebrated earl of Strafford. For some time he travelled abroad as tutor to Lord Falmouth, and in 1646, during a visit to Rome, joined the Roman Catholic Church. In the following year he published his Exomologesis (Paris, 1647), or account of his conversion, which was highly valued by Roman Catholics as an answer to William Chillingworth's attacks. Cressey entered the Benedictine Order in 1649, and for four years resided at Somerset House as chaplain to Catherine of Braganza, wife of Charles II. He died at West Grinstead on the 10th of August 1674. Cressey's chief work, The Church History of Brittanuy or England, from the beginning of Christianity to the Norman Conquest (1st vol. only published, Rouen, 1668), gives an exhaustive account of the foundation of monasteries during the Saxon heptarchy, and asserts that they followed the Benedictine rule, differing in this respect from many historians. The work was much criticized by Lord Clarendon, but defended by Antony à Wood in his Athenae Oxoniensis, which supports Cressey's statement that it was compiled from original MSS. and from the Annales Ecclesiæ Britanniæ of Michael Alford, Dugdale's Monasticon, and the Decem Scriptores Historiae Anglorum. The second part of the history, which has never been printed, was discarded at Douai in 1657. It has been noted in the archives at Rome, which are familiar to the history of Walter Hilton's Scale of Perfection (London, 1659); of Father A. Baker's Santa Sophia (2 vols., Douai, 1657); and of Juliana of Norwich's Sixteen Revelations on the Love of God (1670). These books, which would have been lost but for Cressey's zeal, have been frequently reprinted, and have been favourably regarded by a section of the Anglican Church.

For a complete list of Cressey's works see J. Gillow's Bibl. Dict. of Eng. Catholics, vol. i.

CREST, a town of south-eastern France, in the department of Drôme, on the right bank of the Drôme, 20 m. S.S.E. of Valence by rail. Pop. (1906) town, 3917; commune, 5630. It carries on silk-worm breeding, silk-spinning, and the manufacture of woollens, paper, leather and cement. There is trade in truffles. On the rock which commands the town stands a huge keep, the sole survival of a castle (12th century) to which Crest was indebted for its importance in the middle ages and the Religious Wars. The rest of the castle was destroyed in the first half of the 17th century, after which the keep was used as a state prison. Crest ranked for a time as a bishopric, and in 1447, in that capacity belonged before the Revolution to the prince of Monaco. The communal charter, graven on stone and dating from the 12th century, is preserved in the public archives. Ten miles south-east of Crest lies the picturesque Forest of Saon.

CREST (Lat. crista, a plume or tuit), the "comb" on an animal's head, and so any feathery tuft or excrescence, the "cone" of a helmet (by transference, the helmet itself), and the top or summit of anything. In heraldry (q.v.) a crest is a device, originally borne as a cognizance on a knight's helmet, placed on a wreath above helmet and shield in armorial bearings, and used separately on a seal or on articles of property.

Cresting, in architecture, is an ornamental finish in the wall or ridge of a building, which is common on the continent of Europe. An example occurs at Exeter cathedral, the ridge of which is ornamented with a range of small fleurs-de-lis in lead.

CRESTON, a city and the county-seat of Union county, Iowa, U.S.A., about 60 m. S.W. of Des Moines, at the crossing of the main line and two branches of the Chicago, Burlington & Quincy railway. Pop. (1890) 7290; (1900) 1752; (1905) census 8828 (1910) 9629. The city is on the crest of the divide between the Mississippi and the Missouri basins at an altitude of about 1310 ft.—whence its name. It is situated in a fine farming and stock-raising region, for which it is a shipping point. The site was chosen in 1869 by the Burlington & Missouri River Railroad Company (subsequently merged in the Chicago, Burlington & Quincy Railroad Company) for the location of its shops. Creston was incorporated as a town in 1869, and was chartered as a city in 1872.

CRESTWICK, THOMAS (1811–1869), English landscape-painter, was born at Sheffield, and educated at Hazelwood, near Birmingham. At Birmingham he first began to paint. His earliest appearance as an exhibitor was in 1827, at the Society of British Artists in London; in the ensuing year he sent to the Royal Academy the two pictures named "Llyn Gwynant, Morning," and "Garnarvon Castle." About the same time he settled in London; and in 1836 he took a house in Bayswater. He soon attracted some attention as a landscape-painter, and had a career of uniform and encouraging, though not signal success. In 1842 he was elected an associate, and in 1850 a full member of the Royal Academy, which, for several years before his death, numbered hardly any other full members representing this branch of art. In his early practice he set an example, then too much needed, of diligent study of nature out of doors, painting on the spot all the substance of several of his pictures. English and Welsh streams may be said to have formed his favourite subjects, and generally British rural scenery, mostly under its cheerful, calm and pleasant aspects, in open daylight. This he rendered with elegant and equable skill, colour rather grey in tint, especially in his later years, and more than average technical accomplishment; his works have little to excite, but would, in many conditions of public taste, retain their power to attract. Cresswell worked in the same genre, but produced besides a steady outpouring of paintings, numerous illustrations for books. He was personally genial—a dark, bulky man, somewhat heavy and graceless in aspect in his later years. He died at his house in Bayswater, Linden Grove, on the 28th of December 1869, after a few years of declining health. Among his principal works may be named "England" (1847); "Home by the Sands, and a Squally Day" (1848); "Passing Showers" (1849); "The Wind on Shore, a First Glimpse of the Sea, and Old Trees" (1850); "A Mountain Lake, Moonrise" (1852); "Changeable Weather" (1855); also the "London Road, a Hundred Years ago"; "The Weald of Kent"; the "Valley Mill" (a Cornish subject); a "Shady Glen"; the "Windings of a River"; the "Shade of the Beech Trees"; the "Course of the Greta"; the "Wharfe"; "Glendalough," and other Irish subjects, 1836 to 1840; the "Forest Farm." Frith for figures, and Ansell for animals, occasionally worked in collaboration with Cresswell.

In 1873 T. O. Barlow, the engraver, published a catalogue of Cresswell's works.

CRESTWICK, a borough of Talbot county, Victoria, Australia, 853 m. by rail N.W. of Melbourne. Pop. (1901) 3600. It is the centre of a mining, pastoral and agricultural district. Gold is found both in alluvial and quartz formations, the quartz being especially rich. The surrounding country is fertile and well-timbered, and there is a government plantation and nursery in connexion with the forests department.

CRETACEOUS SYSTEM, in geology, the group of stratified rocks which normally occupy a position above the Jurassic system and below the oldest Tertiary deposits; therefore it is in this system that the closing records of the great Mesozoic era are to be found. The name furnishes an excellent illustration of the inconvenience of employing a local lithological feature in the descriptive title of a wide-ranging rock-system. The white chalk (Lat. creta), which gives its name to the system, was first studied in the Anglo-Parian basin, where it takes a prominent place; but even in this limited area there is a considerable thickness and variety of rocks which are not chalky, and the Cretaceous system as a whole contains a remarkable diversity of rocks.

Classification.—The earlier subdivisions of the Cretaceous rocks were founded upon the uncertain ground of similarity in lithological characters, assisted by observed stratigraphical sequence. This method yielded poor results even in a circumscribed area like Great Britain, and it breaks down utterly when applied to the correlation of rocks of similar age in Europe and elsewhere. Study of the fossils, however, has elicited the fact that certain forms characterize certain "zones," which are preceded and succeeded by other zones each bearing a peculiar species or
The Cretaceous system falls naturally into two divisions, an upper and a lower, in all but a few limited regions. In the table on page 288 the names of the principal stages are enumerated; these are capable of world-wide application. The sub-stages are of more local value, and too much importance must not be attached to them for the correlation of distant deposits. The general table is designed to show the relative position in the system of some of the more important and better-known formations; but it must be remembered that the Cretaceous rocks of Europe can now be classified in considerable detail by their fossils, the most accurate group for this purpose being the cephalopods. The smaller table was compiled by T. C. Chamberlin and R. D. Salisbury to show the main subdivisions of the North American Cretaceous rocks. The correlation of the minor subdivisions of Europe and America are only approximate.

Relation of the Cretaceous Strata to the Systems above and below

In central and northern Europe the boundary between the Cretaceous and Tertiary strata is sharply defined by a fairly general unconformity, except in the Danish and Montian beds, where there is a certain commingling of Tertiary with Cretaceous fossils. The relations with the underlying Jurassic rocks are not so clearly defined, partly because the earliest Cretaceous rocks are obscured by too great a thickness of younger strata, and partly because the lowest observable rocks of the system are not the oldest, but are higher members of the system that have overlapped on to much older rocks. However, in the south of England, in the Alpine areas, and in part of N.W. Germany the passage from Jurassic to Cretaceous is so gradual that there is some divergence of opinion as to the best position for the line of separation. In the Alpine region this passage is formed by marine beds, in the other two by brackish-water deposits. In a like manner the Potomac beds of N. America grade downwards into the Jurassic; while in the Laramie formation an upward passage is observed into the Eocene deposits. There is a very general unconformity and break between the Lower and Upper Cretaceous; this has led Chamberlin and Salisbury to suggest that the Lower Cretaceous should be regarded as a separate period with the title "Comanchean."

Physiographical Conditions and Types of Deposit.—With the opening of the Cretaceous in Europe there commenced a period of marine transgression; in the central and western European region this took place from the S. towards the N., slow at first and local in effect, but becoming more decided at the beginning of the upper division. During the earlier portion of the period, S. England, Belgium and Hanover were covered by a great series of estuarine sands and clays, termed the Wealden formation (q.v.), the delta of a large river or rivers flowing probably from the N.W. Meanwhile, in the rest of Europe alternations of marine and estuarine deposits were being laid down; but as the Alpine region lay the open sea, where there flourished coral reefs and great banks of clam-like molluscs. The sea gradually encroached upon the estuarine Wealden area, and at the time of the Aptian deposits uniform marine conditions prevailed from western Europe through Russia into Asia. This extension of the sea is illustrated in England by the overlap of the Gault over the Lower Greensand on to the older rocks, and by similar occurrences in N. France and Germany.

Almost throughout the Upper Cretaceous period the marine invasion continued, varied here and there by slight movements in the opposite sense which did not, however, interfere with the quiet general advance of the sea. This marine extension made itself felt over the old central plateau of France, the N. of Great Britain, the Spanish peninsula, the Armorican peninsula, and also in the Bavarian Jura and Bohemia; it affected the northern part of Africa and East Africa in N. America in the great spread over the entire length of the Rocky Mountain region; and in Brazil, eastern Asia and western Australia, Upper Cretaceous deposits are found resting directly upon much older rocks. Indeed, at this time there happened one of the greatest changes in the distribution of land and water that have been recorded in geological history.

We have seen that in early Cretaceous times marine limestones were being formed in southern Europe, while estuarine sands and clays were being laid down in the Anglo-German delta, and that beds of intermediate character were being made in parts of N. France and Germany. During later Cretaceous times this striking difference between the northern and southern facies was maintained, notwithstanding the fact that the later deposits were of marine origin in both regions. In the northern region the general deepening and accompanying extension of the sea caused the sandy deposits to become finer grained in N.W. Europe. The other places, the marine deposits and clays then gave way to marly deposits, and in these early stages glauconitic grains are very characteristically present both in the sand and in the marls. In their turn these marly deposits in the Anglo-Parisian basin were succeeded gradually and somewhat intermittently by the purer, soft limestone of the chalk sea, and by limestones, similar in character, in N. France, extra-Alpine Germany, S. Scandinavia, Denmark and Russia. Meanwhile, the S. European deposits maintained the characters already indicated; limestones (not chalk) prevailed, except in certain Alpine and Carpathian tracts where detrital sandstones were being laid down.

The great difference between the lithological characters of the northern and southern deposits is accompanied by an equally striking difference between their respective organic contents. In the north, the genera Inoceramus and Belenestites are particularly abundant. In the south, the remarkable, large, clam-like, chambered pelecypods, the Haploceras, T. floridana, Cephalodites, &c., attained an extraordinary development; they form great lenticular banks, like the clam banks of warm seas, or like our modern oyster-beds; they appear in successive species in the different stages of the Cretaceous system of the south, and can be used for marking palaeontological horizons as the cephalopods are used elsewhere. Certain genera of ammonites, Haploceras, Lytoceras, Phylloceras, rare in the north, are common in the south; and the southern facies is further characterized by the peculiar group of swollen belemnites (Dumontia), by the gastropods Acteonella, Nereina, &c., and by reef-building corals. The southern facies is far more widespread and typical of the period than is the chalk; it not only covers all southern Europe, but spreads eastwards far into Asia and round the Mediterranean basin into Africa. It is found again in Texas, Alabama, Mexico, the West Indies and Colombia; though limestones of the chalk type are found in Texas, New Zealand, and locally in one or two other places. The marine deposits are organically formed limestones, in which foraminifera and large bivalve molluscs play a leading part, marls and sandstones; dolomite and oolitic and pisidial limestones are also known.

The Cretaceous seas were probably comparatively shallow;

This was certainly the case where the deposits are sandy, and in the regions occupied by the hippuritic fauna. Much discussion has taken place as to the depth of the chalk sea. Stress has been laid upon the resemblance of this deposit to the modern deep-sea globigerina-ooze; but on the whole the evidence is in favour of moderate depth, perhaps not more than 1000 fathoms; the freedom of the deposit from detrital matter being regarded as due to the low elevation of the surrounding land, and the main lines of drainage being in other directions. Sandy and shore deposits are common throughout the system in every region. Besides the Weald, there were great lacustrine and terrestrial deposits in N. America (the Potomac, Kootenay, Morrison, Dakota and Laramie formations) as well as in N. Spain, and in parts of Germany, &c. The general distribution of land and sea is indicated in the map.

**Earth Movements and Vulcanicity.**—During the greater part of the Cretaceous period crustal movements had been small and local in effect, but towards the close a series of great deforming movements was inaugurated and continued into the next period. These movements make it possible to discriminate between the Cretaceous and Tertiary rocks, because the conditions of sedimentation were profoundly modified by them, and in most

parts of the world there resulted a distinct break in the sequence of fossil remains. Great tracts of our modern continental land areas gradually emerged, and several mountainous tracts began to be elevated, such as the Appalachians, parts of the Cordilleras, and the Rocky Mountains, and their northern continuation, and indeed the greater part of the western N. American continent was intensely affected; the uplifting was associated with extensive faulting. Volcanic activity was in abeyance in Europe and in much of Asia, but in America there were many eruptions and intrusions of igneous rock towards the close of the period. Diabases and peridotites had been formed during the Lower Cretaceous in the San Luis Obispo region. Great masses of ash and conglomerate occur in the Crow's Nest Pass in Canada; porphyries and porphyry tuffs of later Cretaceous age are important in the Andes; while similar rocks are found in the Lower Cretaceous of New Zealand. It is, however, in the Deccan lava flows of India that we find eruptions on a scale more vast than any that have been recorded either before or since. These outpourings of lava cover 200,000 sq. m. and are from 4000 to 6000 ft. thick. They lie upon an eroded Cenomanian surface and are to some extent interbedded with Upper Cretaceous sediments.

**Economic Products of Cretaceous Rocks.**—Coal is one of the most important products of the rocks of this system. The principal Cretaceous coal-bearing area is in the western interior of N. America, where an enormous amount of coal—mostly lignitic, but in places converted into anthracite—lies in the rocks at the foot of the Rocky Mountains; most of this is of Laramie age. Similar beds occur locally in Montana. Coal seams of Lower Cretaceous age are found in the Black Hills (S. Dakota), Alaska, Greenland, and in New Zealand; and the "Upper Quadr. of Löwenberg in Silesia also contains coal seams. Coals also occur in the brackish and fresh-water deposits of Carinthia, Dalmatia and Istria, while unimportant lignitic beds are known in many other regions. The Fort Pierre beds are oil-bear ing at Boulder, Colorado; and the Trinity formation bears asphalt and bitumen. Important clay deposits are worked in the Raritan formation of New Jersey, &c., and potter y clays are found in the Léonlând district in Germany. The Washita beds yield the well-known hone stone. Great beds of gypsum exist in the Cretaceous rocks of S. America. Near Salzburg a variety of the hippuritic lime stone is quarried for marble. Lithographic stone occurs in the Pyrenees. The economic products peculiar to the chalk are mentioned in the article CHALK. Beds of iron ore are found in the Lower Cretaceous of Germany and England.

The Life of the Cretaceous Period.—The fossils from the Cretaceous series comprise marine, fresh-water and terrestrial animals and plants. Foremost in interest and importance is the appearance in the Lower Potomac (Lower Cretaceous) of eastern and central N. America of the earliest representatives of angiospermous dicotyledons, and undoubtedly monocotyledons, the progenitors of our modern flowering plants. The angiosperms spread outward from the Atlantic coast region of N. America, and first appeared in Europe in the Aptian of Portugal; towards the close of the Lower Cretaceous period they occupied parts of Greenland, the remaining land areas of N. America, and were steadily advancing in every quarter of the globe. At first the Jurassic plants, the Cycads, ferns and conifers, lived on and were the dominant plant forms. Gradually, however, they took a subordinate place, and by the close of the Cretaceous period the angiosperms had gained the upper hand. The earliest of these fossil angiosperms is not in a true sense a primitive form, and no records of such types have yet been discovered. Some of the early forms of the Lower Cretaceous are distinctly similar to modern genera, such as Ficus, Sassafras and Aralia; others bore leaves closely resembling our elm, maple, willow, oak, eucalyptus, &c. Before the close of the period many other representatives of living genera had appeared, beech, walnut, tamarisk, plane, laurel (Laurus), cinnamon, ivy, ilex, viburnum, buckthorn, breadfruit, oleander and others; there were also junipers, thuja, pines and sequoias and monocotyledons such as Potamogeton and Arundo. This flora was widely spread and uniform; there was great similarity between that of Europe and N. America, and in parts of the United States (Virginia and Maryland) the plants were very like those in Greenland. The general aspect of the flora was sub-tropical; the eucalyptus and other plants then common in Europe and N. America are now confined to the southern hemisphere.

The marine fauna comprised foraminifera which must have swarmed in the Chalk and some of the limestone seas; their shells have formed great thickness of rock. Common forms are
CRETE

the genera Alveolina, Crinellina, Rotalia, Textularia, Orbitolina Globigerina. Radiolarians were doubtless abundant, but their remains are rare. Sponges with calcareous (Peronidilla, Barrosoilla) and siliceous skeletons (Siphonina, Celoptychium, Venticulitidae) were very numerous in certain of the Cretaceous waters. Corals were comparatively rare, Trochosphila, Parasmilia, Holocystis being typical genera; reefs were formed in the Maastricht beds of Denmark and Faxoe, in the Neocomian and Turonian of France, in the Turonian of the Alps and Pyrenees, and also in the Gosa beds and in the Uutur group of India. Sea-urchins were a conspicuous feature, and many nearly allied forms are still living; Cidaris, Microster, Discidea are examples. Crinoids were represented by Marsupites, Uintacrinus and Bouguericius; starfish (Calliderrina and Pentagonaster) were not uncommon. Polyzoa were abundant; brachiopods were fairly common, though subordinate to the pelecypods; they were mostly rhychnonellids and terebratulids, which lived side by side with the ancient forms, like Crania and Discina. The bivalve mollusca were very important during this period, Inoceramus, Ostrea, Spondylus, Gervilina, Euxyra, Pecten, Trigonia being particularly abundant in the northern seas, while in the southern waters the remarkable Hippurites, Radiolites, Cuprotina, Caprina, Monopleura and Requienia prevailed. Gastropods were well represented and included many modern genera. Cephalopods were important as a group, but the ammonites, so vigorous in the foregoing period, were declining and were assuming curious degenerate forms, often with a tendency to uncoil the shell; Bucalites, Hoplites, Turritites, Ptychoceras, Hamites are some of the typical genera, while Belemnites and Belemnitella were abundant in the northern seas. The vertebrate fauna of the Cretaceous period differed in many features from that of the present day; mammals appear to have been only poorly represented by puny forms, related to Triassic and Jurassic types; they were mainly marsupials (Batodon, Cimolothus) with a few monotreme-like forms; carnivores, rodents and ungulates were still unknown. As in Jurassic times, reptiles were the dominant forms, and not a few genera lived on from the former period into the Cretaceous; but, on the whole, the reptilian assemblage was no longer so varied, and most of the distinctive mesozoic types had passed away before the close of this period. Dinosaurs were represented by herbivorous and carnivorous genera as in the Jurassic period, but the latter were less abundant than before. The Iguanodon of the Sussex-Weald and Bernissart in Belgium is perhaps the best-known genus, but there were many others which, in their remains being particularly abundant and well-preserved in the Cretaceous deposits of N. America. Titanosaurus, Acanthopholis, Megalosaurus and Hypsilophodon may be mentioned, some of these being of great size, while Diclonius was a curious duck-billed creature; but most remarkable in appearance must have been the horned Dinosaurs, Ceratops and Triceratops, gross, unwieldy creatures, 25 to 50 ft. long, whose huge heads were grotesquely armed with horns and bony frills. Coincident, perhaps, with the widespread extension of the sea was the development of aquatic habits and structures suitable thereto amongst all the reptilian groups including also the birds. The foremost place was undoubtedly taken by the pythonomorphs or sea-serpents, including Mosasauroidea and many others; these were enormously elongated creatures, reaching up to 75 ft., with swimming flappers and powerful swimming tails, and they lived a predatory life in the open sea. Ichthyosaurs soon disappeared from Cretaceous waters; but the plesiosauroidea (Cimolosaurus and others) reached their maximum development in this period. The remarkable flying lizards, pterosaurs, likewise attained their great development and then passed away; they ranged in size from that of a pigeon to creatures with a wing-spread of 25 ft.; notable genera are Pteranodon, Ornitho-
xxvii. 10), about 25 m. from the south coast at Sphakia, in the middle ages the see of a bishop. On the N. side the small island of Dia, or Stendia, about 8 m. from Candia, offers a convenient shelter against northerly gales. Three small islands on the northern coast—Grassula at the N.W. extremity, Suda, at the entrance to Suda harbour, and Spinalonga, in Mirabello Bay—remained for some time in the possession of Venice after the conquest of Crete by the Turks. Grassula, long regarded as an impregnable fortress, was surrendered in 1692, Suda (where the flags of Turkey and the four protecting powers are now hoisted) and Spinalonga in 1715.

Natural Features.—The greater part of the island is occupied by ranges of mountains which form four principal groups. In the western portion rises the massive range of the White Mountains (Aspro Vouna), directly overhanging the southern coast with spurs projecting towards the W. and N.W. (highest summit, Hagios Theodoros, 7882 ft.). In the centre is the smaller, almost detached mass of Psiloritis (Τυφλοπείρος, ancient Ida), culminating in Stavros (8193 ft.), the highest summit in the island. To the E. are the Lassithi mountains with Apheti Christos (7165 ft.), and farther E. the mountains of Sitha with Apheti Kavousi (4850 ft.). The Kophino mountains (3888 ft.) separate the central plateau of the Lassithi from the northern coast. The isolated peak of Iuktas (about 2700 ft.), nearly due S. of Candia, was regarded with veneration in antiquity as the burial-place of Zeus. The principal groups are for the greater part of the year covered with snow, which remains in the deeper clefts throughout the summer; the intervals between them are filled by connecting chains which sometimes reach the height of 3000 ft. The largest plain is that of Monofatsi and Messará, a fertile tract extending between Mt. Psiloriti and the Kophino range, about 37 m. in length and 10 m. in breadth. The smaller plain, or rather slope, adjoining Canea and the valley of Akialóu, through which the Platanos (ancient Iardanos) flows, are of great beauty and fertility. A peculiar feature is presented by the level upland basins which furnish abundant pastureage during the summer months; the more remarkable are the Omalo in the White Mountains (about 4000 ft.) drained by subterranean outlets (κάρδάθορα), Nida (έις την 'Ινδη) in Psiloriti (between 5000 and 6000 ft.), and the Lassithi plain (about 3000 ft.), a more extensive area, on which are several villages. Another distinctive characteristic is found in the numerous cliffs (φαράγγες), both in the more rugged and in the mountainous districts; into some of these the daylight scarcely penetrates. Numerous large caves exist in the mountains; among the most remarkable are the famous Idaean cave in Psiloriti, the caves of Melidoni, in Mylopotamo, and Sarco, in Malevisi, which sheltered hundreds of refugees after the insurrection of 1866, and the Dictaean cave in Lassithi, the birth-place of Zeus. The so-called Labyrinth, near the ruins of Gortyna, was a subterranean quarry from which the city was built. The principal rivers are the Metropoli Potamos and the Apoanopiari, which drain the plain of Monofatsi and enter the southern sea E. and W. respectively of the Kophino range; the Platanos, which flows northwards from the White Mountains into the Bay of Canea; and the Mylopotamo (ancient Oakes) flowing northwards fromPsiloriti to the sea E. of Retimo.

Geology.—The metamorphic rocks of western Crete form a series some 9000 to 10,000 ft. in thickness, of very varied composition. They include gysum, dolomite, conglomerates, phyllites, and a series of eruptive rocks (gabbros, peridotites, serpentines). Glaucophane rocks are widely spread. In the centre of the folds fossiliferous beds with crinoids have been found, and the black slates at a depth of about 500 m., in the Lower Cretaceous, contain calcareous concretions, and a considerable number of corals, brachiopods (Rhyonochea incisoria, &c.) have been found, the fossils indicating the horizon of the Kimmeridge clay. Lower Cretaceous limestones and schists, with radiolarian cherts, are extensively developed; and in many parts of the island Upper Creta-

ceous limestones with Rudistes and Eocene beds with nummulites have been found. All these are involved in the earth movements to which the mountains of the island owe their formation, and the Miocene beds (with Clypeaster) and later deposits lie almost undissected over the surface of the older rocks. The Jurassic beds is associated an extensive series of eruptive rocks (gabbro, peridotite, serpentinite, diorite, granite, &c); they are chiefly of Jurassic age, but the eruptions may have continued into the Upper Cretaceous.

The structure of the island is complex. In the west the folds run from north to south, curving gradually westward towards the southern and western coasts; but in the east the folds appear to run almost due north and to the continuation of the Dinaric folds of the Balkan peninsula. The structure is further complicated by a great thrust-plane which has brought the Jurassic and Lower Cretaceous beds upon the Upper Cretaceous and Eocene beds.

Vegetation.—The forests which once covered the mountains have for the most part disappeared and the slopes are now desolate wastes. The cypress still grows wild in the higher regions; the lower hills and the valleys, which are extremely dry, are covered with olive woods. Oranges and lemons also abound, and are of excellent quality, furnishing almost the whole supply of continental Greece and Constantinople. Chestnut woods are found in the Sellino district, and forests of the valonia oak in that of Retimo; in some parts the carob tree is abundant and supplies an important article of consumption. Pears, apples, quinces, mulberries and other fruit-trees flourish, as well as vines; the Cretan wines, however, no longer enjoy the reputation which they possessed in the time of the Venetians. Tobacco and cotton succeed well in the plains and low grounds, though not at present cultivated to any great extent.

Animals.—Of the wild animals of Crete, the wild goat or agrimi (Capra aegagrus) alone need be mentioned; it is still found in considerable numbers on the higher summits of Psiloriti and the White Mountains. The same species is found in the Caucasus and Mount Taurus, and is distinct from the ibex or bosquetin of the Alps. Crete, like several other large islands, enjoys immunity from dangerous serpents—a privilege ascribed by popular belief to the intercession of Titus, the companion of St Paul, who according to tradition was the first bishop of the island, and became in consequence its patron saint. Wolves also are not found in the island, though common in Greece and Asia Minor. The native breed of mules is remarkably fine.

Population.—The population of Crete under the Venetians was estimated at about 250,000. After the Turkish conquest it greatly diminished, but afterwards gradually rose, till it was supposed to have attained to about 260,000, of whom about half were Mahomedans, at the time of the outbreak of the Greek revolution in 1821. The ravages of the war from 1821 to 1830, and the emigration that followed, caused a great diminution, and the population was estimated by Ashby in 1836 at only about 130,000. In the next generation it again materially increased; it was calculated by Spratt in 1855 as amounting to 210,000. According to the census taken in 1881, the complete publication of which was interdicted by the Turkish authorities, the population of the island was 279,165, or 3578 to the square kilometre. Of this total, 142,602 were males, 137,563 females; 33,173 were literate, 242,114 illiterate; 205,020 were orthodox Christians, 73,524 Moslems, and 921 of other religious persuasions. The most remarkable element predominant in the population was—Candia, 21,358; Canea, 13,812; Retimo, 9274. According to the census taken in June 1906, the population of the island was 301,273, the Christians having increased to 265,266, while the Moslems had diminished to 35,281. The Moslems, as well as the Christians, are of Greek origin and speak Greek.

Towns.—The three principal towns are on the northern coast and possess small harbours suitable for vessels of light draught. Candia, the former capital and the see of the archbishop of Crete (pop. in 1900, 22,501), is officially styled Herakleion; it is surrounded by remarkable Venetian fortifications and possesses a museum with a valuable collection of objects found at Cnossus, Phaestus, the Idaean cave and elsewhere. It has been occupied since 1807 by British troops. Canea (Xavía), the seat of government since 1840 (pop. 20,972), is built in the Italian style; its
walls and interesting galley-slips recall the Venetian period. The residence of the high commissioner and the consular powers are in the suburb of Halepa. Retimo (Pethonas) is, like Canea, the see of a bishop (pop. 9311). The other towns, Hieraerpa, Sitia, Kisamos, Selino and Sphakia, are unimportant.

Production and Industries.—Owing to the volcanic nature of its soil, Crete is probably rich in minerals. Recent experiments lead to the conclusion that iron, lead, manganese, lignite and sulphur exist in considerable abundance. Copper and zinc have also been found. A large number of applications for mining concessions have been received, and it is hoped that some of the companies will be organized under the government. The principal wealth of the island is derived from its olive groves; notwithstanding the destruction of many thousands of trees during each successive insurrection, the production is assured and remunerated, and will remain considerably owing to the planting of young trees and the improved methods of cultivation which the Government is endeavouring to promote. The orange and lemon groves have suffered considerably, but new varieties of the orange tree are now being introduced, and an impulse will be given to the export trade in this fruit by the removal of the restriction on its importation into Greece. Agriculture is still in a primitive condition; notwithstanding the fertility of the soil, and the abundance of capital, the wants and defects of the population. A great portion of the central plain of Monofatsi, the principal grain-producing district, is lying fallow owing to the exodus of the Moslem peasantry. The cultivation of silk, tobacco, and muscadine grape, has grown considerably in recent years, but efforts are now being made to revitalize it. There are few manufactories. Soap is produced at fifteen factories in the principal towns, and there are two distilleries of cognac at Candia.

Commerce.—The commerce of Crete has increased largely by many drawbacks, such as the unsatisfactory condition of the harbours, the want of direct steamship lines to England and other countries, and the deficiency of internal communications. The total value of imports for the four years 1901—1904 was £1,576,831; the value of exports £1,386,777; excess of imports over exports £370,054. Exports in 1904 were valued at £149,642, the principal items being agricultural products (oranges, lemons, carobs, almonds, grapes, valonia, &c.), value £153,856; olives and products of olives (oil, soap, &c.), value £201,359; and hides, leather, and leather goods, value £37,086. The principal imports are Turkey, England, Egypt, Austria and Russia. Imports in 1904 were valued at £459,465, including agricultural products (mainly flour and corn), value £101,500; wines, spirits, and textiles, £109,340. Corks are imported from the Black Sea and Danube ports, ready-made clothing from Austria and Germany, articles of luxury from Austria and France, and cotton textiles from England. Imports are charged 8%., exports 1%.

Constitution and Government.—During the past half-century the affairs of Crete have repeatedly occupied the attention of Europe. Owing to the existence of a strong Mussulman minority among its inhabitants, the warlike character of the natives, and the mountainous configuration of the country, which enabled a portion of the Christian population to maintain itself in a state of partial independence, the island has constantly been the scene of prolonged and sanguinary struggles in which the numerical superiority of the Christians was counterbalanced by the aid rendered to the Moslems by the Ottoman troops. This unhappy state of affairs was aggravated and perpetuated by the intrigues set on foot at Constantinople against successive governors of the island, the conflicts between the Palace and the Porte, the duplicity of the Turkish authorities, the dissensions of the representatives of the great powers, the machinations of Greek agitators, the rivalry of Cretan politicians, and prolonged financial mismanagement. A long series of insurrections—those of 1821, 1833, 1841, 1858, 1868, and 1888—may be regarded as briefly mentioned—culminated in the general rebellion of 1897, which led to the interference of Greece, the intervention of the great powers, the expulsion of the Turkish authorities, and the establishment of an autonomous Cretan government under the suzerainty of the sultan. According to the autonomous constitution of 1899 the supreme power was vested in Prince George of Greece, acting as high commissioner of the protecting powers. The authority thus conferred was confined exclusively to the prince, and was declared liable to modification by law in the case of his successor. The modified constitution of February 1907 curtailed the large exceptional legislative and administrative powers then accorded. The high commissioner is irresponsible, but his decrees, except in certain specified cases, must be countersigned by a member of his council. He convokes, progræus and dissolves the chamber, sanctions laws, exercises the right of pardon in case of political offences, represents the island in its foreign relations and is chief of its military forces. The chamber (βουλή), which is elected in the proportion of one deputy to every 3000 inhabitants, meets annually for a session of two months. New elections are held every two years. The chamber exercises a complete financial control, and no taxes can be imposed without its consent. The high commissioner is aided in the administration by a cabinet of three members, styled "councillors" (συμβούλιοι), who superintend the departments of justice, finance, education, public security and the interior. The councillors, who are nominated and dismissed by the high commissioner, are responsible to the chamber, which may impeach them before a special tribunal for any illegal act or neglect of duty.

In general the Cretan constitution is characterized by a conservative spirit, and contrasts with the ultra-democratic systems established in Greece and the Balkan States. A further point of difference is the more liberal payment of public functionaries in Crete. For administrative purposes the departmental divisions existing under the Turkish government have been retained. The existing civil functions (fora sangues) each under a prefect (επιδήμαρχος), and 23 eparchies (former kazas) under a sub-prefect (επαρχόχωρος). All these functionaries are nominated by the high commissioner. The prefects are assisted by departmental councils. The system of municipal and communal government remains practically unchanged. The island is divided into 86 communes, each with a mayor, an assistant-mayor, and a communal council elected by the people. The councils assess within certain limits the communal taxes, maintain roads, bridges, &c., and generally superintend local affairs. Public order is maintained by a force of gendarmerie (χαροφορική) organized and at first commanded by Italian officers, who were replaced by Greek officers in December 1906. The constitution authorizes the formation of a militia (πολιτικόφαλον) to be enrolled by conscription, but in existing circumstances the embodiment of this force seems unnecessary.

Justice.—The administration of justice is on the French model. A supreme court of appeal, which also discharges the functions of a court of cassation, sits at Canea. There are two assize courts at Canea and Candia; and a court of first instance in each of the five departments. There are 26 justices of peace, to whose decision are referred slight contraventions of the law (παιχνίδα) and civil causes in which the amount claimed is below 600 francs. These functionaries also hold monthly sessions in the various communes. The judges are chosen without regard to religious belief, and precautions have been taken to render them independent of political parties. They are appointed, transferred or removed by order of the council of justice, a body composed of the five highest judicial dignitaries, sitting at Canea. An order for the removal of a judge must be based upon a conviction for some specified offence before a court of law. The jury system has not been introduced. The Greek penal code has been adopted with some modifications. The Ottoman civil code is maintained for the present, but it is proposed to establish a code recently drawn up by Greek jurists which is mainly based on Italian and Saxon law. The Mussulman cadis retain their special courts. According to law, Mędwell, an English, divorce, the wardship of minors and inheritance.

Religion and Education.—The vast majority of the Christian population belongs to the Orthodox (Greek) Church, which is governed by a synod of seven bishops under the presidency of the metropolitan of Candia. The Cretan Church is not, strictly speaking, autocephalous, being dependent on the patriarchate of Constantinople. There were in 1907 3,500 Greek churches in the island with 53 monasteries and 3 nunneries; 55 mosques, 4 Roman Catholic churches and 4 synagogues. Education is nominally compulsory. In 1907 there were 547 primary schools (527 Christian and 20 Mahomedean), and 31 secondary schools
CRETE

(All Christian). About £20,000 is granted annually by the state for the purposes of education.

Finance.—Owing to the havoc wrought during repeated insurrections, the impoverishment of the provinces, and the desolation of the districts formerly inhabited by the Moslem agricultural population, and the drain of gold resulting from the sale of Moslem lands and emigration of the former proprietors, together with other causes, the financial situation has been unsatisfactory. Notwithstanding the advance of £160,000 made by the four protecting powers after the institution of autonomous government and the profits (£6,937) derived from the issue of a new currency in 1900, there was at the beginning of 1906 an accumulated deficit of £24,476, which represents the floating debt. In addition to the above-mentioned development of government powers, the state contracted a loan of £60,000 in 1901 to acquire the rights and privileges of the Ottoman Debt, to which the salt monopoly has been conceded for 20 years. In the budgets for 1905 and 1906 considerable economies were effected by the curtailment of salaries, the abolition of various thesis, and the reduction of the estimates for education and public works. The estimated revenue and expenditure for 1906 were as follows:

Revenue.

Drachmae (gold). Drachmae (gold).
Direct taxes 1,494,980 High Commissioner 200,000
Indirect taxes 1,715,000 Financial administra-
Stamp duties . 351,700 tion . . . . . . . . . . . . 694,670
Other sources 780,967 Education and Justice 1,453,500

4,341,667 4,026,736

The salary of the high commissioner was reduced in 1907 to 100,000 drachmae.

Improved communications are much needed for the transport of agricultural produce, but the state of the treasury does not admit of more than a nominal expenditure on road-making and other public works. On these the average yearly expenditure between 1898 and 1905 was £1,344.04. The prosperity of the island depends on the development of agriculture, the acquirement of industrious habits by the peasantry, and the abandonment of petty trade. The Cretans were in 1906 more lighted taxed than any other people in Europe. The tithe had been replaced by an export tax on exported agricultural produce levied at the custom-houses, and the smaller peasant proprietors and shepherds of the mountainous districts were practically exempt from any contribution to the state. The communal tax did not exceed on the average two francs annually for each family. The poorer communities are aided by a state subvention. (J. D. B.)

Archaeology.

The recent exploration and excavation of early sites in Crete have entirely revolutionized our knowledge of its remote past, and afforded the most astonishing evidence of the existence of a highly advanced civilization going far back behind the historic period. Great "Minoan" palaces have been brought to light at Cnossus and Phaestus, together with a minor but highly interesting royal abode at Hagia Triada near Phaestus. "Minoan" towns, some of considerable extent, have been discovered at Cnossus itself, at Gournia, Palaiakastro, and at Zakro. The early sanctuary of the Dictaean Zeus has been explored, and throughout the whole length and breadth of the island a mass of early materials has now been collected. The comparative evidence afforded by the discovery of Egyptian relics shows that the Great Age of the Cretan palaces covers the close of the third and the first half of the second millennium before our era. But the contents of early tombs and dwellings and indications supplied by such objects as stone vases and seal-stones show that the Cretans had already attained to a considerable degree of culture, and had opened out communication with the Nile valley in the time of the earliest Egyptian dynasties. This more primitive phase of the indigenous culture, of which several distinct stages are traceable, is known as the Early Minoan, and roughly corresponds with the first half of the third millennium B.C. The succeeding period, to which the first palaces are due and to which the name of Middle Minoan is appropriately given, roughly coincides with the Middle Empire of Egypt. An extraordinary perfection was at this time attained in many branches of art, notably in the painted pottery, often with polychrome decoration, of a class known as "Kamares" from its first discovery in a cave of that name on Mount Ida. Imported specimens of this ware were found by Flinders Petrie among XIth Dynasty remains at Abydos. The earlier phases of a school of wall painting also go back to the Middle Minoan period, and metal technique and such arts as gem engraving show great advance. By the close of this period a manufactory of fine faience was attached to the palace of Cnossus. The succeeding Late Minoan period, best illustrated by the later palace at Cnossus and that at Hagia Triada, corresponds in Egypt with the Hyksos period and the earlier part of the New Empire. In the first phase of this the Minoan civilization attains its acme, and the succeeding style already shows much that may be described as rococo. The later phase, which follows on the destruction of the Cnossian palace, and corresponds with the diffused Mycenæan style of mainland Greece and elsewhere, is already partly decadent. Late Minoan art in its finest aspect is best illustrated by the animated ivory figures, wall paintings, and gesso duro reliefs at Cnossus, by the painted stucco designs at Hagia Triada, and the steatite vases found on the same site with zonies in reliefs exhibiting life-like scenes of warriors, toreadors, gladiators, wrestlers and pugilists, and of a festal throng perhaps representing a kind of "harvest home." Of the more conventional side of Late Minoan life a graphic illustration is supplied by the remains of miniature wall paintings found in the palace of Cnossus, showing groups of court ladies in curiously modern costumes, seated on the terraces and balustrades of a sanctuary. A grand "palace style" of vase painting was at the same time evolved, in harmony with the general decoration of the royal halls.

It had been held till lately that the great civilization of prehistoric Greece, as first revealed to us by Schliemann's discoveries at Mycenæ, was not possessed of the art of writing. In 1893, however, Arthur Evans observed some signs on seal-stones from Crete which led him to believe that a hieroglyphic system of writing had existed in Minoan times. Explorations carried out by him in Crete from 1894 onwards, for the purpose of investigating the prehistoric civilization of the island, fully corroborated this belief, and showed that a linear as well as a semi-pictorial form of writing was diffused in the island at a very early period ("Cretan Pictographs and Phaeno-

Earlier pictographic script.

Phoenician Script," Journ. Hellenic Studies, iv. pt. 11). In 1895 he obtained a libation-table from the Dictaean cave with a linear dedication in the prehistoric writing ("Further Discoveries, &c., J.H.S. xvii.""). Finally in 1900 all scepticism in the learned world was set at rest by his discovery in the palace of Cnossus of whole archives consisting of clay tablets inscribed both in the pictographic (hieroglyphic) and linear forms of the Minoan script (Evans, "Palace of Knossos," Reports of Excavation, 1900-1905; Scripta Minoa, vol. i., 1909). Supplementary finds of inscribed tablets have since been found at Hagia Triada (F. Halbherr, Rapporte, &c., Monumenti antichi, 1903) and elsewhere (Palaiakastro, Zakro and Gournia). It thus appears that a highly developed system of writing existed in Minoan Crete some two thousand years earlier than the first introduction under Phoenician influence of Greek letters. In this, as in so many other respects, the old Cretan tradition receives striking confirmation. According to the Cretan version preserved by Diodorus (v. 74), the Phoenicians did not invent letters but simply altered their forms.

There is evidence that the use in Crete of both linear and pictorial signs existed in the Early Minoan period, contemporary with the first Egyptian dynasties. It is, however, during the Middle Minoan age, the centre point of which corresponds with the XIIth Egyptian dynasty, according to the Sothic system of dating, c. 2000-1850 B.C., that a systematized pictographic or hieroglyphic script makes its appearance which is common both to signs and clay tablets. During the Third Middle Minoan period, the lower limits of which approach 1600 B.C., this pictographic script finally gives way to a still more developed linear system—which is itself divided into an earlier and a later class. The earlier class (A) is already found in the temple repositories of Cnossus belonging to the age immediately preceding the great remodelling of the
CRETE

palace, and this class is specially well represented in the tablets of Hagia Triada (M.M. iii. and L.M. i.). The later class (B) of the linear script is that used on the great bulk of the clay tablets of the Cretan palace, amounting in number to nearly 2000.

These clay archives are almost exclusively inventories and business documents. Their general purport is shown in many cases by pictorial figures relating to various objects which appear on them—such as chariots and horses, ingots and metal vases, arms and implements, stores of corn, &c., flocks and herds. Many showing human figures apparently contain lists of personal names. A decimal system of numeration was used, with numbers going up to 10,000. But the script itself is as yet undeciphered, though it is certain that clear words have changing suffixes, and that there were many compound words. The script also recurs on walls in the shape of graffiti, and on vases, sometimes ink-written; and from the number of seals originally attached to perishable documents it is probable that parchment or similar material was also used. In the easternmost district of Crete, where the aboriginal "Eteocretan" element survived to historic times (Faress, Palaiakastro), later inscriptions have been discovered belonging to the 6th and succeeding centuries B.C., written in Greek letters on an indigenous language (Comparative, Mon. Ant., sqq.; R. S. Conway, British School Annual, viii. 125 sqq. and ib. x.).

In 1908 a remarkable discovery was made by the Italian Mission at Pheastus of a clay disk with impressed hieroglyphic characters belonging to a non-Cretan system and probably from W. Anatolia.

The remains of several shrines within the building, and the religious element perceptible in the frescoes, show that a considerable part of the Palace of Cnossus was devoted to purposes of cult. It is clear that the rulers, as so commonly in ancient states, fulfilled priestly as well as royal functions. The evidence supplied by this and other Cretan sites shows that the principal Minoan divinity was a kind of Magna Mater, a Great Mother or nature goddess, with whom was associated a male satyr. The cult in fact corresponds in its main outlines with the early religious conceptions of Syria and a large part of Anatolia—a correspondence probably explained by a considerable amount of ethnic affinity existing between a large section of the primitive Cretan population and that of southern Asia Minor. The Minoan goddess is sometimes seen in a chthonic form with serpents, sometimes in a more central aspect with doves, at times with lions. One part of her religious being survives in that of the later Rhea, another in that of Aphrodite, one of whose epithets, Arideia (= the exceeding holy), takes us back to the earliest Cretan tradition. Under her native name, Britomartis (= the sweet maiden) or Dictyna, she approaches Artemis and Leto, again associated with an infant god, and this Cretan virgin goddess was worshipped in Aegina under the name of Aphaea. It is noteworthy that whereas, in Greece proper, Zeus attains a supreme position, the old superiority of the Mother Goddess is still visible in the Cretan traditions of Rhea and Dictyna and the infant Zeus.

Although images of the deities were certainly known, the principal objects of cult in the Minoan age were of the aniconic class; in many cases these were natural objects, such as rocks and mountain peaks, with their cave sanctuaries, like those of Ida or of Dicte. Trees and curiously shaped stones were also worshipped, and artificial pillars of wood or stone. These latter, as in the well-known case of the Lion's Gate at Mycenae, often appear with guardian animals as the central motif. The principal feature of this cult is the bringing down of the celestial spirit by proper incantations and rituals into these fetish objects, the dove perched on a column sometimes indicating its descent. It is a primitive cult similar to that of Early Canaan, illustrated by the pillow stone set up by Jacob, which was literally "Bethel" or the "House of God." The story of the baetylus, or stone swallowed by Saturn under the belief that it was his son, the Cretan Zeus, seems to cover the same idea and has been derived from the same Semitic word.

A special form of this "baetylus" cult in Minoan Crete was the representation of the two principal divinities in their fetish form by double axes. Shrines of the Double Axes have been found in the palace of Cnossus itself, at Hagia Triada, and in a small palace at Gournia, and many specimens of the sacred emblem occurred in the Cave Sanctuary of Dicte, the mythical birthplace of the Cretan Zeus. Complete scenes of worship in which libations are poured before the Sacred Axes are, moreover, given on a fine painted sarcophagus found at Hagia Triada.

The same cult survived to later times in Caria in the case of Zeus Labrandeus, whose name is derived from labrys, the native name for the double axe, and it had already been suggested on philological grounds that the Cretan "labyrinthos" was formed from a kindred form of the same word. The discovery that the great Minoan foundation at Cnossus was at once a palace and a sanctuary of the Double Axe and its associated divinities has now supplied a striking and it may well be thought an overwhelming confirmation of this view. We can hardly any longer hesitate to recognize in this vast building, with its winding corridors and subterranean ducts, the Labyrinth of later tradition; and as a matter of fact a maze pattern representing the conventional representation of the Labyrinth is formed in the halls forming the decoration of one of the corridors of the palace. It is difficult, moreover, not to connect the repeated wall-paintings and reliefs of the palace illustrating the cruel bull sports of the Minoan arena, in which girls as well as youths took part, with the legend of the Minotaur, or bull of Minos, for whose grisly meals Athens was forced to pay annual tribute of her sons and daughters. It appears certain from the associations in which they are found at Cnossus, that these Minoan bull sports formed part of a religious ceremony. Actual figures of a monster with a bull's head and man's body occurred on seals of Minoan fabric found on this and other Cretan sites.

It is abundantly evident that whatever mythic element may have been interwoven with the old traditions of the spot, they have a solid substratum of reality. With such remains before us it is no longer sufficient to relegate Minos to the regions of sun-myths. His legendary presentation as the "Friend of God," like Abraham, to whom as to Moses the law was revealed on the holy mountain, calls up in our sight such characteristics of the "king of autocrats" as the palace-sanctuary of Cnossus itself presupposes. It seems possible even that the ancient tradition which recorded an earlier or later king of the name of Minos may, as suggested above, cover a dynastic title. The earlier and later palaces at Cnossus and Phaestus, and the interrupted phases of each, seem to point to a succession of dynasties, to which, as to its civilization as a whole, it is certainly convenient to apply the name "Minoan." It is interesting, as bringing out the personal element in the traditional royal seat, that an inscribed sealing belonging to the earliest period of the later palace of Cnossus bears on it the impression of two official signets with portrait heads of a man and of a boy, recalling the "associations" on the coinage of imperial Rome. It is clear that the later traditions in many respects accurately summed up the performances of the "Minoan" dynasty who carried out the great buildings now brought to light. The palace, with its wonderful works of art, executed for Minos by the craftsman Daedalus, has ceased to belong to the realms of fancy. The extraordinary architectural skill, the sanitary and hydraulic science revealed in details of the building, bring us at the same time face to face with the power of mechanical invention with which Daedalus was credited. The elaborate method and bureaucratic control visible in the clay documents of the palace point to a highly developed legal organization. The powerful fleet and maritime empire which Minos was said to have established will no doubt receive fuller illustration when the sea-town of Cnossos comes to be explored. The appearance of ships on some of the most important seal-impressions is not needed, however, to show how widely Minoan influence made itself felt in the neighboring Mediterranean regions.

The Nilotic influence visible in the vases, seals and other fabrics of the Early Minoan age, seems to imply a maritime
CRETE

423

activity on the part of the islanders going back to the days of the first Egyptian dynasties. In a deposit at Kahun, belonging to the XXIst Dynasty, c. 2000 B.C., were already found imported polychrome vases of "Middle Minoan" fabric. In the same way the important part played by Cretan enterprise in the days of the New Egyptian empire is illustrated by repeated finds of Late Minoan pottery on Egyptian sites. A series of monuments, moreover, belonging to the early part of the XVIIIth Dynasty show the characteristics of the Keft and peoples of "The King" and of the "Lands to the West" in the fashionable costume of the Cretan court, bearing precious vessels and other objects of typical Minoan forms. Farther to the east the recent excavations on the old Philistine sites like Gezer have brought to light swords and vases of Cretan manufacture in the later palace style. The principal Philistine tribe is indeed known in the biblical records as the Cherethins or Cretans, and the Minoan name and the cult of the Cretan Zeus were preserved at Gaza to the latest classical days. Similar evidence of Minoan contact, and indeed of wholesale colonization from the Aegean side, recurs in Cyprus. The culture of the more northerly Aegean islands, best revealed to us by the excavations of the British School at Smyrna in Melos, also attest a growing influence from the Cretan side, which, about the time of the later palace at Cnossus, becomes finally predominant.

Turning to the mainland of Greece we see that the astonishing remains of a highly developed prehistoric civilization, which Schliemann first brought to light in 1876 at Mycenae, and which from those discoveries received the general name of "Mycenaean," in the main represent a transmarine offshoot from the Minoan stock. The earlier remains both at Mycenae and Tiryns, still imperfectly investigated, show that this Cretan influence goes back to the Middle Minoan age, with its characteristic style of polychrome vase decoration. The contents of the royal tombs, on the other hand, reveal a wholesale correspondence with the fabrics of the Minoan first, and, to a less degree, the second Late Minoan age, as illustrated by the relics belonging to the Middle Period of the later palace at Cnossus and by those of the royal villa at Hagia Triada. The chronological centre of the great beehive tombs seems to be slightly earlier. The collection of the Orkomenos, and the painted vases and gold cups from the Vaphio tomb by Sparta, with their marvellous reliefs showing scenes of bull-hunting, represent the late palace style at Cnossus in its final development.

The leading characteristics of this mainland civilization are thus indistinguishable from the Minoan. The funeral rites are similar, and the religious representations show an identical form of worship. At the same time the local traditions and conditions differentiate the continental from the insular branch. In Crete, in the later period, when the rulers could trust to the "wooden walls" of the Minoan navy, there is no parallel for the massive fortifications that we see at Tiryns or Mycenae. The colder winter climate of mainland Greece dictated the use of fixed hearths, whereas in the Cretan palaces these seem to have been of a portable kind, and the different usage in this respect again reacted on the respective forms of the principal hall or "Megaron."

Minoan culture under its mainland aspect left its traces on the Acropolis at Athens,—a corroboration of the tradition which made the Athenians send their tribute children to Minos. Similar traces extend through a large part of the central part of Greece. Some of these from Orchomenus, the point of all others on this side where the early Cretan influence seems most to have taken root. The Minoan remains at Orchomenus which are traceable to the latest period go far to substantiate the philological comparison between the name of Minyas, the traditional ancestor of this ancient race, and that of Minos.

Still farther to the north-west a distinct Minoan influence is perceptible in the old Illyrian lands east of the Adriatic, and its traces reappear in the neighbourhood of Venice. It is well marked throughout the eastern side of the Adriatic and in a special way connected by ancient tradition. Here, as in Crete, Daedalus executed great works like the temple of Eryx, and it was on Sicilian soil that Minos, engaged in a western campaign, was said to have met with a violent death at the hands of the native king Kokolos (Cocalus) and his daughters. His name is preserved in the Sicilian Minos, and his tomb was pointed out in the neighbourhood of Agrigentum, with a shrine above dedicated to his native Aphrodite, the lady of the dove; and in this connexion it must be observed that the cult of Eryx perpetuates to much later times the characteristic features of the worship of the Cretan Nature goddess, as now revealed to us in the palace of Cnossus and elsewhere. These ancient indications of a Minoan connexion with Sicily have now received interesting confirmation in the numerous discoveries, principally due to the recent excavations of P. Orsi, of arms and painted vases of Late Minoan fabric in Bronze Age tombs of the provinces of Syracuse and Girgenti (Agrigentum) belonging to the late Bronze Age. Some of the Megaron or the Palace of Minos at Cnossus was very unsafe to infer as yet any large displacement of the original inhabitants by the invading swarms from the mainland or elsewhere.

The evidence of a partial restoration of the domestic quarter of the palace of Cnossus tends to show a certain measure of dynastic continuity. There is evidence, moreover, that the script and with it the indigenous language did not die out during this period, and that therefore the days of Hellenic settlement at Cnossus were not yet. The recent exploration of a cemetery belonging to the close of the great palace period, and in a greater degree to the age succeeding the catastrophe, has now conclusively shown that there was no real break in the continuity of Minoan culture. This third Late Minoan period,—the beginning of which may be fixed about 1400— is an age of stagnation and decline, but the point of departure continued to be the models supplied by the age that preceded it. Art was still by no means extinct, and its forms and decorative elements are simply later derivatives of the great palace style. Not only the native form of writing, but many household arrangements, domestic usages, and religious rites remain substantially the same. The third Late Minoan age corresponds generally with the Late Mycenaean stage in the Aegean world (see AEgeAN CIVILIZATION). It is an age indeed in which the culture as a whole, though following a lower level, attains the greatest amount of uniformity. From Sicily and even the Spanish coast to the Troas, southern Asia Minor, Cyprus and Palestine,—from the Nile valley to the mouth of the Po, very similar forms were now diffused. Here and there, as in Cyprus, we watch the development of some local schools. How far Crete
itself continued to preserve the hegemony which may reasonably be ascribed to it at an earlier age must remain doubtful. It is certain, however, that the character of this third and concluding Late Minoan period in the island certain mainland types of swords and safety-pins make their appearance, which are symptomatic of the great invasion from that side that was now impending or had already begun.

**Principal Minoan Sites.**

It will be convenient here to give a general view of the more important Minoan remains recently excavated on various Crete sites.

**Cnossus.**—The palace of Cnossus is on the hill of Kephala about 4 m. inland from Candia. As a scene of history and settlement, this site is of the highest antiquity. The sunken court or "Minoan" strata, which go well back into the fourth millennium B.C., reach down to a depth of about 17 ft. But below this again is a human deposit, from 20 to 26 ft. in thickness, representing a long and gradual course of Neolithic settlement. Minoan development had reached a point where it must have been the same as the strata were formed at approximately the same rate as the upper, we have an antiquity of from 12,000 to 14,000 years indicated for the first Neolithic settlement on this spot. The hill itself, like a Fell of Babylonia, is mainly formed of the debris of human settlements. The palace was approached from the west by a paved Minoan Way communicating with a considerable building on the opposite hill. This road was flanked by magazines, some belonging to the royal area, others to the dwellings of the aristocratic class. The palace itself was entered by a broad flight of steps on the east side (theatral area). The palace itself was approximately formed a square with a large paved court in the centre. It had a N.S. orientation. The principal entrance was to the north, but what appears to have been the royal staircase opened on a paved court on the west side. This entrance communicated with a corridor showing frescoes of a processionary character. The west side of the palace contained a series of 18 magazines with great store jars and cists and large hordes of bronze daggers and bronze daggers (bronze daggers). A range of a circular pillared hall, a council chamber with a gymnasium of curiously Gothic aspect and lower stone benches round. The walls of the throne room show frescoes with sacred griffins confronting each other in a Nile landscape, and a small bath chamber was also roofed. Opposite the throne room the walls of this room shows the double axes sign constantly repeated on its walls and pillars, and remains of miniature wall-paintings showing pillar shrines, in some cases with double axes stuck into the wooden columns. Here too were found the remains of a large shrine. The entire palace seems to have been the basement of a very large hall or the "Megaron," approached directly from the central court, and near this were found further relics, fresco representations of scenes of bull-fighting with female figures and fragments of a wooden bed (euanus). There was also a gaming-board of gold-plated ivory with interspersed work of crystal plaques set on silver plates and blue enamel (cynus). The true domestic quarter lay to the south of the great hall, and was approached from the north by a long staircase. A flights and traces of a fourth are preserved. This gives access to a whole series of halls and private rooms (halls of the Colonades, "of the Double Axes", "Queen's Megaron") with bath-room attached and bathrooms of which there is only a fragment (euanus, ivory plaques, and other objects of art), together with extensive remains of a house storey. The drainage system here, including a water-closet, is of the ancient and modern kind. Near this domestic quarter was found a small shrine of the Double Axes, with cult vases of the period. In the upper levels and smaller chambers. The palace at an earlier "Middle Minoan" palace beneath the later floor-levels are most visible on the east side, with splendid ceramic remains. Here also are early magazines with huge store jars. At the foot of this slope, following the eastern boundary of the N.S. of the palace, a dependency containing an important hoard of bronze vessels (ib. p. 112 sqq.). The building on the hill to the W. approached by the Minoan paved way has the appearance of a smaller palace (B.S. America, xii., 1906). Many remains of private houses belonging to the prehistoric town have also come to light (Hogarth, K.B.S. vii., 1900, p. 70 sqq.). A little N. of the town, at a spot called Zafer Papoura, an extensive Late Minoan cemetery was excavated in 1904 (Evans, The Prehistoric Tombs of Knossos, 1906), and on a height about 2 m. N. of this, a royal tomb consisting of a square chamber, which originally had a pointed vault of "Cyclopean" structure apparently was a royal tomb. From the Cercovom, nearly the remains of a vaulted structure in the form of a pyramid, the work seems to date from the close of the Middle Minoan age, but has been re-used for interments at successive periods (Evans, Archæologia, 1906, p. 136 sqq.). It is possibly the traditional tomb of Idomeneus, son of Phaestos and the Greek hero of the Trojan War.

**Phaestos.**—The acropolis of this historic city looks on the Libyan Sea and commands the extensive plain of Messara. On the eastern hill of the acropolis, excavations initiated by F. Halbherr on behalf of the German Archaeological Institute at Athens, conducted by L. Pernier have brought to light another Minoan palace, much resembling on a somewhat smaller scale that of Cnossus. The plan here too was roughly quadrangular with a central court, but owing to the country containing an exiguous fragment of this quarter has disappeared. The Phaestos palace belongs to two distinct periods, and the earlier or "Middle Minoan" part better preserved than at Cnossus. The west court and entrance belonging to the earlier building show many analogies with those of Cnossus, and the court walls had evidently been formed by a group of streets and a large vaulted room. The remains of the "theatrical area" at Cnossus on a larger scale. Magazines with fine painted store jars came to light beneath the floor of the later "propylaeum." The most imposing block of the later building is formed by a group of rooms in the south-east angle, covered by the old west wall. A fine paved corridor running east from this gives access to a line of the later magazines, and through a small door to the central court beyond, while to the left of this a broad and still open court acknowledged to be the south-west angle of the palace. North of the central court is a domestic quarter presenting analogies with that of Cnossus, but throughout the later building there was a great dearth of the frescoes and other remains such as inscriptions and peculiar objects are seen here. There are also also few remaining traces here of upper stores. It is evident that in this case the palace was overtaken by a great catastrophe, followed by a partial reoccupation towards the close of the Late Minoan age (L. G. Quaglia, Storia delle missioni italiane a Phaestos; Monumenti anticoli, xii. and xiv.).

About a kilometre distant from the palace of Phaestos near the village of Kalyvia a Late Minoan cemetery was brought to light in connection with the excavations in the period as that of Cnossus (Savignoni, Necrospoli di Phaestos, 1905).

**Hagia Triada.**—On a low hill crowned by a small church of the above name, about 3 m. nearer the Libyan Sea than Phaestos, a large palace or palace, of the Later Minoan age, was discovered by Halbherr and excavated by the Italian Mission.

In its structure, however, it bears a very close resemblance to that of Cnossus and Phaestos, and on a smaller scale. The buildings themselves, with the usual halls, bath-rooms and magazines, together with a shrine of the Mother Goddess, were connected by a stair or steps and led to a higher level approached by flights of stairs. Repositories also came to light containing treasure in the shape of bronze ingots. In contrast to the palace of Phaestos, the contents of the royal villa proved exceedingly rich, and among the treasure that was discovered, the most marvellous is the great hall which was built over a great number of clay sealings with religious and other devices and incised countermarks. Both the signet types and the other objects of art here discovered display the fresh naturalism that characterizes that of the palace of Cnossus. The town was traversed by a well-paved street with a stone sewer, and contained several important private houses and a larger one which seems to have been...

CRETE

a small palace. Among the more interesting relics found were ivory figures of Egyptian or strongly Egyptianizing fabric. On an adjacent hill were remains of what seems to have been in later times a temple of the Dictaean Zeus, and from the occurrence of rich deposits of Mycenaean gold and silver in the neighborhood of the temple, a religious tradition represented by the later temple seems to go back to prehistoric times. On the neighboring height of Petsóphi, by a rock-elter, remains of another interesting shrine were brought to light recently. In another part of the region, earth offerings of terra-cotta, many of them apparently relating to cures or to thewarding off of diseases (R. C. Bosanquet, British School Annual, vii. 286 sqq.; R. M. Dawkins, ibid. ix. 390 sqq., x.; J. H. Hall, ibid. xii. 21 sqq.).

Near this hamlet on the coast of the Gulf of Mirabello in east Crete, the American archaeologist Miss Harriet Boyd has excavated a great part of another Minoan town. It covers the sides of a long hill, its main avenue being a winding roadway leading to a small palace.

It contained a shrine of the Cretan male goddess, and was rich in minor relics, chiefly in the shape of bronze implements and pottery for household use. The bulk of the remains belong here, as at Hagia Triada, to the beginning of the Late Minoan period, but there are signs of reoccupation in the decadent Minoan age. The remains supply detailed information as to the everyday life of a Cretan country town at the middle of the second millennium B.C. (H. Boyd, Excavations at Gournia).

Zakros. These belong to the name of that town on the S.E. coast. Important remains of a settlement contemporary with that of Gournia were explored by D. G. Hogarth, consisting of houses and pits containing painted pottery of exceptional beauty and a great variety of objects; in particular, a boat-shaped vase in which Zakro lies a well-known pot of oil for the fishing fleets on their way to the sponge grounds of the Libyan coast, and doubtless stood in the same stead to the Minoan shipping (D. G. Hogarth, Annual of the British School, viii. 121 sqq.; T. W. Halbherr, Studien, i., 124 sqq., and ii., 30 sqq.).

Dictaean Cave.—Near the village of Psychro on the Lasithi range, answering to the western Dicte, opens a large cave, identified with the legendary birthplace of the Cretan Zeus. This cavern also shared with similar shrines of the archaic period in which Zeus has been supplanted by Zeus, as, for instance, the law from Zeus. The exploration begun by the Italian mission under Halbherr and continued by Evans, who found here the inscribed liration (see above), was completed by Hogarth, who, in 1913, found the great entrance hall of the cavern, which was worked as the upper shrine, were descending vaults forming a lower narrower going down deep into the bowels of the earth. Great quantities of votive figures and objects of cult, such as the fetish double axes and stone tables of offering, were found both above and below. In the lower shaft, the natural pillars of stalagmite had been used as objects of worship, and bronze votive objects thrust into their crevices (Halbherr, Museo di antichità classica, ii. pp. 906-910; Evans, Further Discoveries, &c., pp. 350 sqq.; Myc. Theo. Palaikastro, i. 14 sqq.; Hogarth, "The Dictaean Cave," Annual of British School at Athens, vi. 94 sqq.).

Psiea and Mochlos.—On these two islands on the northerm coast of E. Crete, R. Seager, an American explorer, has found striking remains of flourishing Minoan settlements. The contents of a series of tombs at Mochlos throw an entirely new light on the civilization of the Early Minoan age.

The above summary gives, indeed, a very imperfect idea of the extent to which the remains of the great Minoan civilization are spread throughout the island. The "hundred cities" ascribed to Crete by Homer are in a fair way of becoming an ascertained reality. The great days of Crete lie thus beyond the historic period. The period of decline referred to above (Late Minoan III.), which begins about the beginning of the 14th century before our era, must, from the abundance of finds, have been of considerable duration. The character of the inscriptions found in the area has not been ascertained, and the date of their incursions, contemporary Egyptian monuments afford the best clue. The Keftiu who represented Minoan culture in Egypt in the concluding period of the Cnossian palace (Late Minoan II.) cease to appear on Egyptian monuments towards the end of the XVIIIth Dynasty (c. 1350 B.C.), and their place is taken by the "Peoples of the Sea." The Achaeans, under the name Akaisha, already appear among the piratical invaders of Egypt in the time of Rameses III. (c. 1200 B.C.) of the XXth Dynasty (see H. R. Hall, "Keftiu and the Peoples of the Sea," Annual of British School at Athens, viii. 157 sqq.).

Greek settlements in Crete.

About the same time the evidences of imports of Late Minoan or "Mycenaean" fabrics in Egypt definitely cease. In the Odyssey we already find the Achaeans together with Dorians settled in central Crete. In the extreme west and west of the island the aboriginal "Eteocretan" element, however, as represented respectively by the Prasians or Cypriotes, still held its own, and inscriptions written in Greek characters show that the old language survived to the centuries immediately preceding the Christian era.

The dark ages.

The mainland invasions which produced these great ethnic changes in Crete are marked archaeologically by signs of widespread destruction and by a considerable break in the continuity of the insular civilization. New burial customs, notably the rite of cremation in place of the older corpse-burial, are introduced, and in many cases the earlier tombs were pillaged and re-used by new comers. The use of iron for arms and implements now finally triumphed over bronze. Northern forms of swords and safety-pins are now found in general use. A new geometrical style of decoration like that of contemporary Greece largely supplants the Minoan models. The civic foundations which belong to this period, and which include the greater part of the massive ruins of Goula and Anavylos in the province of Mirabello and of Hyrtykla in the west, affect more or less precipitous sites and show a greater tendency to fortification. The old system of writing now dies out, and it is not till some three centuries later that the new alphabetic forms are introduced from a Semitic source. The whole course of the older Cretan civilization is thus ariually interrupted, and is separated from the new by the true dark ages of Greece.

It is nevertheless certain that some of the old traditions were preserved by the remnants of the old population now reduced to a subject condition, and that these finally leavened the whole lump, so that once more — this time under a Hellenic guise — Crete was enabled to anticipate mainland Greece in nascent civilization. Already in 1883 A. Milchhöfer (Anfänge der Kunst) had called attention to certain remarkable examples of archaic Greek bronze-work, and the subsequent discovery of the votive braziers in the cave of Zeus on Mount Ida, and notably the shields with their fine embossed designs, shows that by the 8th century B.C. Cretan technique in metal not only held its own beside imported Cypro-Phoenician work, but was distinctly ahead of that of the rest of Greece (Hallherr, Bronzi del antro di Zeus Ideo). The recent excavations by the British School on the site of the Dictaean temple at Palaikastro bear out this conclusion, and an archaic marble head of Apollo found at Eleuthera shows that classical tradition was not at fault in recording the existence of a very early school of Greek sculpture in the island, illustrated by the names of Dipiones and Scyllis.

The Dorian dynasts in Crete seem in some sort to have claimed descent from Minos, and the Doric legislators sought their sanction in the laws which Minos was said to have received from the hands of the Cretan Zeus. The great monument of Gortyna discovered by Halbherr and Fabricius (Monumenti antichi, iii.) is the most important monument of early law hitherto brought to light in any part of the Greek world. Among other Greek remains in the island may be mentioned, besides the great inscription, the archaic temple of the Pythian Apollo at Gortyna, a plain square building with a prostyle pediments added in later times, excavated by Halbherr, 1885 and 1887 (Mon. Ant. iii. 1 sqq.), the Heraion or bridge and the vast rock-cut reservoirs of Eleuthera, the city walls of Itanos, Aptera and Polyrhenia, and at Phalasarna, the rock-cut throne of a divinity, the port, and the remains of a temple. The most interesting record, however, that has been preserved of later Hellenic civilization in the island is the coinage of the Cretan cities (J. N. Svoronos, Numismatique de la Crete ancienne; W. Wroth, B. M. Coin Catalogue, Crete, &c.; P. Gardner, The Types of Greek Coins), which during the good period display a peculiarly picturesque artistic style distinct from that of the rest of the Greek world, and sometimes indicative of a revival of Minoan types. But in every case these artistic efforts were followed at short intervals by gross relapses into barbarism which reflect the anarchy of the political conditions.

Under the Pax Romana the Cretan cities again enjoyed a large measure of prosperity, illustrated by numerous edifices still existing at the time of the Venetian occupation. A good
account of these is preserved in a MS. description of the island drawn up under the Venetians about 1438, and existing in the library of St Mark (published by Falkner, Museum of Classical Antiquities, ii. pp. 263-303). Very little of all this, however, has escaped the Turkish conquest and the ravages caused by the incessant insurrections of the last two centuries. The ruin-field of Gortyna still evokes something of the importance that it possessed in Imperial days, and at Lebena on the south coast are remains of a temple of Aesculapius and its dependencies which stood in connexion with this city. At Cnossus, save some blocks of the amphitheatre, the Roman monuments visible in Venetian times have almost wholly disappeared. Among the early Christian remains of the island far and away the most important is the church of St Titus at Gortyna, which perhaps dates from the Constantinian age.

LITERATURE.—See the authorities already quoted, for further details. Previous to the extensive excavations referred to above, Crete had been carefully examined and explored by Tournefort, Pococke, Olivier and other travellers, e.g. Pashley (Travels in Crete, 2 vols., London, 1837) and Captain Spratt (Travels and Researches in Crete, 2 vols., London, 1863). A survey sufficiently accurate as regards the maritime parts was also executed, under the orders of the British admiral, by Captain Graves and Captain (afterwards Admiral) Spratt. Most that can be gathered from ancient authors concerning the mythology and early history of the island is brought together, by Meyerius (Cretan and Eastern, the 3rd vol. of his Work and Hoeck (Kreta, 3 vols., Göttingen, 1823-1829), but the latter work was published before the researches which have thrown so much light on the topography and antiquities of the island. Much new material has been added by later scholars. Crete was the centre of the whole from the Neolithic period to the Roman period.
above the south coast. In the eastern portion of the island were Praesus in the interior, and Itanus on the coast, facing the east, while Zlicca on the south coast was only place of importance on the side facing Africa, and on this account rose under the Romans to be one of the principal cities of the island.

(A. J. E.)

Medieval to 19th Century.—Though it was continually torn by civil dissensions, the island maintained its independence of the various Macedonian monarchs by whom it was surrounded; but having incurred the enmity of Rome, first by an alliance with the great Mithradates, and afterwards by taking active part with their neighbours, the pirates of Cilicia, the Cretans were at length attacked by the Roman arms, and, after a resistance protracted for more than three years, were finally subdued by Q. Metellus, who earned by this success the surname of Creticus (67 B.C.). The island was now reduced to a Roman province, and subsequently united for administrative purposes with the district of Cyrenaica or the Pentapolis, on the opposite coast of Africa. This arrangement lasted till the time of Constantine, by whom Crete was incorporated in the prefecture of Illyria. It continued to form part of the Byzantine empire till the 9th century, when it fell into the hands of the Saracens (823). It then became a formidable nest of pirates and a great slave mart; it defied all the efforts of the Byzantine sovereigns to recover it till the year 960, when it was reconquered by Nicephorus Phocas.

In the partition of the Greek empire after the capture of Constantinople by the Latins in 1204, Crete fell to the lot of Boniface, marquis of Montferrat, but was sold by him to the Venetians, and thus passed under the dominion of that great republic, to which it continued subject for more than four centuries.

Under the Venetian government Candia, a fortress originally built by the Saracens, and called by them “Khandax,” became the seat of government, and not only rose to be the capital and chief city of the island, but actually gave name to it, so that it was called in the official language of Venice “the island of Candia,” a designation which from thence passed into modern maps. The ancient name of Krete or Kriti was, however, always retained in use among the Greeks, and is gradually resuming its place in the usage of literary Europe. The government of Crete by the Venetian aristocracy was, like that of their other dependencies, very arbitrary and oppressive, and numerous insurrections were the consequence. Daru, in his history of Venice, mentions fourteen between the years 1297 and 1365, the most important being that of 1361-1364,—a revolt not of the natives against the rule of their Venetian masters, but of the Venetian colonists against the Venetian republic. But with all its defects their administration did much to promote the material prosperity of the country, and to encourage commerce and industry; and it is probable that the island was more prosperous than at any subsequent time. Their Venetian masters at least secured to the islanders external tranquillity, and it is singular that the Turks were content to leave them in undisturbed possession of this opulent and important island for nearly two centuries after the fall of Constantinople. The Cretans themselves, however, were eager for a change, and, disappointed in the hope of a Genoese occupation, were ready, as is stated in the report of a Venetian commissioner, to exchange the rule of the Venetians for that of the Turks, whom they fondly expected to find more lenient, or at any rate less energetic, masters. It was not till 1645 that the Turks made any serious attempt to effect the conquest of the island; but in that year they landed with an army of 50,000 men, and speedily reduced the important city of Candia. Retimo fell the following year, and in 1648 they laid siege to the capital city of Candia. This was the longest siege on record, having been protracted for more than twenty years; but in 1667 it was pressed with renewed vigour by the Turks under the grand vizier Ahmed Kuprili, and the city was at length compelled to surrender (September 1668). Its fall was followed by the submission of the whole island. Venice was allowed to retain possession of Grabusa, Suda and Spinalonga on the north, but in 1718 these three strongholds reverted to the Turks, and the island was finally lost to Venice.

From this time Crete continued subject to Ottoman rule without interruption till the outbreak of the Greek revolution. After the conquest large part of the inhabitants embraced Mahomedanism, and thus secured to themselves the chief share in the administration of the island. But far from this having a favourable effect upon the condition of the population, the result was just the contrary, and according to R. Ashley (Travels in Crete, 1837) Crete was the worst governed province of the Turkish empire. In 1770 an abortive attempt at revolt, the hero of which was “Master” John, a Phakiot chief, was repressed with great cruelty. The regular authorities sent from Constantinople were wholly unable to control the excesses of the janissaries, who exercised without restraint every kind of violence and oppression. In 1813 the ruthless severity of the governor-general, Haji Osman, who obtained the co-operation of the Christians, broke the power of the janissaries; but after Osman had fallen a victim to the suspicions of the sultan, Crete again came under their control. When in 1821 the revolution broke out in continental Greece, the Cretans, headed by the Phakiots, after a massacre at Canaa at once raised the standard of insurrection. They carried on hostilities with such success that they soon made themselves masters of the whole of the open country, and drove the Turks and Mussulman population to take refuge in the fortified cities. The sultan then invoked the assistance of Mehemet Ali, pasha of Egypt, who despatched 7000 Albanians to the island. Hostilities continued with no decisive result till 1824, when the arrival of further reinforcements enabled the Turkish commander to reduce the island to submission. In 1827 the battle of Navarino took place, and in 1830 (3rd of February) Greece was declared independent. The allied powers (France, England and Russia) decided, however, that Crete should not be included amongst the islands annexed to the newly-formed kingdom of Greece; but recognizing that some change was necessary, they obtained from the sultan Mahmud II. its cession to Egypt, which was confirmed by a firman of the 20th of December 1832. This change of masters brought some relief to the unfortunate Cretans, who at least exchanged the licence of local misrule for the oppression of an organized despotism; and the government of Mustafa Pasha, an Albanian like Mehemet Ali, the ruler of the island for a considerable period (1832-1852), was more enlightened and intelligent than that of most Turkish governors. He encouraged agriculture, improved the roads, introduced an Albanian police, and put down brigandage. The period of his administration has been called the “golden age” of Crete.

In 1840 Crete was again taken from Mehemet Ali, and replaced under the dominion of the Turks, but fortunately Mustafa still retained his influence. Until 1864 the Cretans continued to be governor general. Four years later an insurrection broke out, owing to the violation of the provisions of an imperial decree (February 1856), whereby liberty of conscience and equal rights and privileges with Mussulmans had been conferred upon Christians. The latter refused to lay down their arms until a firman was issued (July 1858), confirming the promised concessions. These promises being again repudiated, in 1864 the inhabitants held an assembly and a petition was drawn up for presentation at Constantinople by the governor. The Sultan’s reply was couched in the vaguest terms, and the Cretans were ordered to render unquestioning obedience to the authorities. After a period of great distress and cruel oppression, in 1866, on the demand for reforms being again refused, a general insurrection took place, which was only put down by great exertions on the part of the Porte. It was followed by the concession of additional privileges to the Christians of the island and of a kind of constitutional government and other reforms embodied in what is known as the “Organic Statute” of 1868. (J. H. F.)

Modern Constitutional.—Cretan constitutional history may be said to date from 1868, when, after the suppression of an insurrection which had extended over three years, the Turkish government consented to grant a certain measure of autonomy to the island. The privileges so accorded were embodied in what is known as the Organic Statute, an instrument which eventually obtained a somewhat wider importance, being proposed by
Article XXIII. of the Berlin Treaty as a basis of reforms to be introduced in other parts of the Ottoman empire. Various privileges already acquired by the Christian population were confirmed; a general council, or representative body, was brought into existence, composed of deputies from every district in the island; mixed tribunals were introduced, together with a highly elaborate administrative system, under which all the more important functionaries, Christian and Mussulman, were provided with an assessor of the opposite creed. The new constitution, however, proved costly and unworkable, and failed to satisfy either section of the population. The Christians were ready for another outbreak, when, in 1878, the Greek government, finding Hellenic aspirations ignored by the treaty of San Stefano, gave the signal for agitation in the island. During the insurrection which followed, the usual barbarities were committed on both sides; the Christians betook themselves to the mountains, and the Mussulman peasants crowded into the fortified towns. Eventually the Cretan chiefs invoked the mediation of England, which Turkey, exhausted by her struggle with Russia, was ready to accept, and the convention known as the Pact of Halepa was drawn up in 1878 under the auspices of Mr. Sandwich, the British consul, and Ablastides Pasha, both of whom enjoyed a high degree of confidence. The privileges conferred by the Organic Statute were confirmed; the cumbersome and extravagant judicial and administrative systems were maintained; the judges were declared independent of the executive, and an Assembly composed of forty-nine Christian and thirty-one Mussulman deputies took the place of the former general council. A parliamentary régime was thus inaugurated, and party warfare for a time took the place of the old religious antagonism, the Moslems attaching themselves to one or other of the political factions which now made their appearance among the Christians. The material interests of the island were neglected in the scramble for place and power; the finances fell into disorder, and the party which came off worst in the struggle systematically intrigued against the governor-general of the day and conspired with his enemies at Constantinople. A crisis came about in 1889, when the "Conservative" leaders, finding themselves in a minority in the chamber, took up arms and withdrew to the mountains. Though the outbreak was unconnected with the religious feud, the latent fanaticism of both creeds was soon aroused, and the island once more became a scene of pillage and devastation. Eight thousand, the massive force of 1889, resulted unfavourably for the Christians. The Porte, having induced the Greek government to persuade the insurgents not to oppose the occupation of several strategic posts, despatched a military governor to the island, proclaimed martial law, and issued a firman abrogating many important provisions of the Halepa Pact. The mode of election to the assembly was altered, the number of its members reduced, and the customs revenue, which had hitherto been shared with the island, was appropriated by the Turkish treasury. The firman was undoubtedly illegal, as it violated a convention possessing a quasi-international sanction, but the Christians were unable to resist, and the powers abstained from intervention. The elections held under the new system proved a failure, the Christians refusing to go to the polls, and for the next five years Crete was governed absolutely by a succession of Mahomedan Vals. The situation went from bad to worse, the deficit in the budget increased, the gendarmerie, which received no pay, became insubordinate, and crime multiplied. In 1894 the Porte, at the instance of the powers, nominated a Christian, Karatheodory Pasha, to the governorship, and the Christian chiefs, mollified by the concession of 1889, agreed to take part in the assembly which soon afterwards was convoked; no steps, however, were taken to remedy the financial situation, which became the immediate cause of the disorders that followed. The refusal of the Porte to refund considerable sums which had been illegally diverted from the Cretan treasury or even to sanction a loan to meet immediate requirements caused no little exasperation in the island, which was increased by the recall of Karatheodory (March 1895). Before that event an Epitropé, or "Committee of Reform," had appeared in the mountains—the harbingers of the prolonged struggle which ended in the emancipation of Crete. The Epitropé was at first nothing more than a handful of discontented politicians who had failed to find places in the administration, but some slight reverses which it succeeded in inflicting on the Turkish troops brought thousands of armed Christians to its side, and in April 1896 it found itself strong enough to invest the important garrison town of Vamos. The Moslem peasantry now flocked to the fortified towns and civil war began. Serious disturbances broke out at Canea on the 24th of May, and were only quelled by the arrival of foreign warships. The foreign consuls intervened in the hope of bringing about a peaceful settlement, but the Sultan resolved on the employment of force, and an expedition despatched to Vamos effected the relief of that town with a loss of 200 men. The advance of a Turkish detachment through the western districts, where other garrisons were besieged, was marked by pillage and devastation, and 5000 Christian peasants took refuge on the desolate promontory of Spada, where they suffered extreme privations. These events, which produced much excitement in Greece, quickened the energies of the powers. An international blockade of the island was proposed by Austria but rejected by England. The ambiguous attitude of Constantinople, however, ultimately caused the Porte, and the Sultan, alarmed at this juncture by an Armenian outbreak, began to display a conciliatory disposition. The Pact of Halepa was restored, the troops were withdrawn from the interior, financial aid was promised to the island, a Christian governor-general was appointed, the assembly was summoned, and an imperial commissioner was despatched to negotiate an arrangement. The Christian leaders prepared a moderate scheme of reforms, based on the Halepa Pact, which, with a few exceptions, were approved by the powers and eventually sanctioned by the sultan. On the 4th of September 1896 the assembly formally accepted the new constitution and declared its gratitude to the powers for their intervention. The Moslem leaders acquiesced in the arrangement, which the powers undertook to guarantee, and, notwithstanding some symptoms of discontent at Candia, there was every reason to hope that the island was now entering upon a period of tranquillity. It soon became evident, however, that the Porte was endeavouring to obstruct the execution of the new reforms. Several months passed without any step being taken towards this realization; difficulties were raised with regard to the composition of the international commissions charged with the reorganization of the gendarmerie and judicial system; intrigues were set on foot against the Christian governor-general; and the presence of a special imperial commissioner, who had no place under the constitution, proved so injurious to the restoration of tranquillity that the powers demanded his immediate recall. The indignation of the Christians increased, a state of insecurity prevailed, and the Moslem peasants refused to return to their homes. A new factor now became apparent in Cretan politics. Since the outbreak in May 1896 the Greek government had loyally co-operated with the powers in their efforts for the pacification of the island, but towards the close of the year secret society known as the Ethnikē Hetaeria began to arrogate to itself the direction of Greek foreign policy. The aim of the society was a war with Turkey with a view to the acquisition of Macedonia, and it found a ready instrument for its designs in the growing discontent of the Cretan Christians. Emisaries of the society now appeared in Crete, large consignments of arms were landed, and at the beginning of 1897 the insurrection had been practically in a state of insurrection. On the 11st of January the Greek fleet was mobilized. Affairs were brought to a climax by a series of conflicts which took place at Canea on the 4th of February; the Turkish troops fired on the Christians, a conflagration broke out in the town, and many thousands of Christians took refuge on the foreign warships in the bay. The Greek government now despatched an ironclad and a cruiser to Canea, which were followed a few days later by a torpedo flotilla commanded by
Prince George. The prince soon retired to Melos, but on the night of the 14th of February a Greek expeditionary force under Colonel Vassos landed at Kolymbia near Canea, and its commander issued a proclamation announcing the occupation of the island in the name of King George. On the same day Georgi Pasha, the Christian governor-general, took refuge on board a Russian ironclad, and, on the next, naval detachments from the warships of the powers occupied Canea. This step paralysed the movements of Colonel Vassos, who after a few slight engagements with the Turks remained practically inactive in the interior. The insurgents, however, continued to threaten the town, and their position was bombarded by the international fleet (21st February). The intervention of Greece caused immense excitement among the Christian population, and terrible massacres of Moslem peasants took place in the eastern and western districts. The forces of the powers shortly afterwards occupied Candia and the other maritime towns, while the international fleet blockaded the Cretan coast. These measures were followed by the presentation of collective notes to the Greek and Turkish governments (2nd March), announcing the decision of the powers that (1) Crete could in no case in present circumstances be annexed to Turkey; (2) in view of the delays caused by Turkish prevarication, the application of the rule of Crete should be entrusted with an effective autonomous administration, intended to secure to it a separate government, under the suzerainty of the sultan. Greece was at the same time summonsed to remove its army and fleet from the island, while the Turkish troops were to be concentrated in the fortresses and eventually withdrawn. The cabinet of Athens, however, declined to recall the expeditionary force, which remained in the interior till the 9th of May, when, after the Greek reverses in Thessaly and Epirus, an order was given for its return. Meantime Cretan autonomy had been proclaimed (20th March). After the departure of the Greek troops the Cretan leaders, who had hitherto demanded annexation to Greece, readily acquiesced in the decision of the powers, and the insurgent Assembly, under its president Dr Sphakianakis, a man of good sense and moderation, co-operated with the international commanders in the maintenance of order. The pacification of the island, however, was delayed by the presence of the Turkish troops and the inability of the powers to agree in the choice of a new governor-general. The prospect of a final settlement being spoiled by the withdrawal of Germany and Austria, which had favoured Turkish pretensions, from the European concert (April 1898), the remaining powers divided the island into four departments, which they severally undertook to administer. An attack made by the Moslems of Candia on the British garrison of that town, with the connivance of the Turkish authorities, brought home to the powers the necessity of removing the Ottoman troops, and the last Turkish soldiers quitted the island on the 14th of November 1898.

On the 26th of that month the nomination of Prince George of Greece as high commissioner of the powers in Crete for a period of three years (renewed in 1901) was formally announced, and on the 21st of December the prince landed at Suda and made his public entry into Canea amid enthusiastic demonstrations. For some time after his arrival complete tranquillity prevailed in the island, but the Moslem population, reduced to great distress by the prolonged insurrection, emigrated in large numbers. On the 27th of April 1899 a new autonomous constitution was approved by a constituent assembly, and in the following June the local administration was handed over to Cretan officials by the international authorities. The extensive powers conferred by the constitution upon Prince George were increased by subsequent enactments. In 1902 M. Venezelo, who had played a noteworthy part in the last insurrection, was dismissed from the post of councillor by the prince, and soon afterwards became leader of a strong opposition party, which denounced the arbitrary methods of the government. During the next four years party spirit ran high; in the spring of 1904 a deputation of chiefs and politicians addressed a protest to the prince, and early in the following year a band of armed malcontents under M. Venezelo raised the standard of revolt at Theriso in the White Mountains. The insurgents, who received moral support from Dr Sphakianakis, proclaimed the union of the island with Greece (March 1905), and their example was speedily followed by the assembly at Canea. The powers, however, reiterated their decision to maintain the status quo, and increased their military and naval forces; the Greek flag was hoisted at Canea and Candia, and some desultory engagements with the insurgents took place, the international troops co-operating with the native gendarmerie. In the autumn M. Venezelo and his followers, having obtained an amnesty, laid down their arms. A commission appointed by the powers to report on the administrative and financial situation drew up a series of recommendations in January 1906, and a constituent assembly for the revision of the constitution met at Canea in the following June. On the 27th of July the powers announced a series of reforms, including the reorganization of the gendarmerie and militia under Greek officers, as a preliminary to the eventual withdrawal of the international troops, and the extension to Crete of the system of financial control established in Greece. On the 14th of September, under an agreement dated the 14th of August, they invited King George of Greece, in the event of the high commissionership becoming vacant, to propose a candidate for that post, to be nominated by the powers for a period of five years, and on the 25th of September Prince George left the island. He had done much for the welfare of Crete, but his participation in party struggles and his attitude towards the representatives of the powers had rendered his position untenable. His successor, M. Alexander Zaimis, a former prime minister of Greece, arrived in Crete on the 1st of October.

On the 22nd of February 1907 M. Zaimis, as high commissioner, took the oath to the new constitution elaborated after much debate by the Cretan national assembly. His position was one of singular difficulty. Apart from the rivalry of the factions within the Assembly, there was the question of the Mussulman minority, dwindling it is true, but still a force to be reckoned with. The high commissioner, true to his reputation as a prudent statesman and astute politician, showed great skill in dealing with the situation. From the first he had taken up an attitude of conciliation and had proposed to his premise as well as to identify himself with any faction. In such matters as appointments to the judicial bench, indeed, his studied impartiality offended both parties; but on the whole his administration was a marked success, and the cessation of the chronic state of disturbance in the island justified the powers in preparing for the withdrawal of their troops. In spite of the admission of their co-religionists to high office in the government, the Mussulmans, it is true, still complained of continuous ill-treatment for its object their expatriation; but these complaints were declared by Sir Edward Grey, in answer to a question in parliament, to be exaggerated. The protecting powers had fixed the conditions preliminary to evacuation—(1) the organization of a native gendarmerie, (2) the maintenance of the tranquillity of the island, (3) the complete security of the Mussulman population. On the 20th of March 1908 M. Zaimis called the attention of the powers to the fact that these conditions had been fulfilled, and on the 11th of May the powers announced to the high commissioner their intention of beginning the evacuation at once and completing it within a year. The first withdrawal of the troops (July 25), hailed with enthusiasm by the Cretan Christians, led to rioting by the Mussulmans, who believed themselves abandoned to their fate.

Meanwhile M. Zaimis had made a further advance towards the annexation of the island to Greece by a visit to Athens, where he arranged for a loan with the Greek National Bank and engaged Greek officers for the new gendarmerie. The issue was precipitated by the news of the revolution in Turkey. On the 12th

1 The Mussulman population, 88,000 in 1895, had sunk to 40,000 in 1907, and the emigration was still continuing. The loss to the country in wealth exported and land going out of cultivation has been very serious.
CRETINISM

of October the Cretan Assembly once more voted the union with Greece, and in the absence of M. Zaimis—who had gone for a holiday to Santa Maura—elected a committee of six to govern the island in the name of the king of Greece.

Against this the Musulman deputies protested, in a memorandum addressed to the British secretary of state for foreign affairs. His reply, while stating that his government would safeguard the interests of the Musulmans, left open the question of the attitude of the powers, complicated now by sympathy with reformed Turkey. The efforts of diplomacy were directed to allaying the resentment of the “Young Turks” on the one hand and the ardour of the Greek unionists on the other; and meanwhile the Cretan administration was carried on peaceably in the name of King George. At last (July 13, 1909) the powers announced to the Porte, in answer to a formal remonstrance, their decision to withdraw their remaining troops from Crete by July 26 and to station four war-ships off the island to protect the Moslems and to safeguard “the supreme rights” of the Ottoman Empire. This arrangement, which was duly carried out, was avowedly “provisional” and satisfied neither party, leading in Greece especially to the military and constitutional crises of 1909 and 1910.

W. A. P.

CRETINISM, the term given to a chronic disease, either sporadic or endemic, arising in early childhood, and due to absence or deficiency of the normal secretion of the thyroid gland. It is characterized by imperfect development both of mind and body. The thyroid gland is either congenitally absent, imperfectly developed, or there is definite goitre. The origin of the word is doubtful. Its southern French form *christia* suggested to Michel a derivation from *cresta* (crale), the goose foot of red cloth worn by the Cagots of the Pyrenees. The Cagots, however, were not cretins. The word is usually explained as derived from *christien* (Christian) in the sense of “innocent.” But *christianus* (which appears in the Lombard cristianet; compare the Savoyard innocents and gens du bon dieu) is probably a translation of the older *cretin*, and the latter is probably connected with *creta* (crale)—a sallow or yellow-earthly complexion being a common mark of cretinism.

The endemic form of cretinism prevails in certain districts, as in the valleys of central Switzerland, Tirol and the Pyrenees. In the United Kingdom cretins have been found in England at Oldham, Sholver Moor, Crompton, Duffield, Cromford (near Matlock), and other points in Derbyshire; endemic goitre has been seen near Nottingham, Chesterfield, Pontefract, Ripon, and the mountainous parts of Staffordshire and Yorkshire, the east of Cumberland, certain parts of Worcester, Warwick, Cheshire, Monmouth, and Leicester, near Horsham in Hampshire, near Haslemere in Surrey, and near Beaconsfield in Buckingham. In Scotland cretins and cases of goitre have been seen in Perthshire, on the east coast of Fife, in Roxburgh, the upper portions of Peebles and Selkirk, near Lanark and Dumfries, in the east of Ayrshire, in the west of Berwick, the east of Wigtown, and in Kirkcudbright. The disease is not confined to Europe, but occurs in North and South America, Australia, Africa and Asia. Wherever endemic goitre is present, endemic cretinism is present also, and it has been constantly observed that when a new family moves into a goitrous district, goitre appears in the first generation, cretinism in the second. The causation of goitre has now been shown to be due to drinking certain waters, though the particular impurity in the water which gives rise to this condition has not been determined (see Goitre). The causation of the sporadic form of cretinism is, however, obscure.

Cretinism usually remains unrecognized until the child reaches some eighteen months or two years, when its lack of mental development and uncouth bodily form begin to attract attention. Occasionally the child appears to be normal in infancy, but the cretinoid condition develops later, any time up to puberty. The essential point in the morbid anatomy of these cases is the absence or abnormal condition of the thyroid gland (see Metabolic Diseases). It may be congenitally absent, atrophied, or the seat of a goitre, though this last condition is very rare in cases of sporadic cretinism. The skeleton shows arrested growth, most marked in the case of the long bones. The skull in the endemic form of cretinism is usually brachycephalic, but in the sporadic cases it is more commonly dolichocephalic. The pathology of cretinism and its allied condition myxoedema (q.v.) has now been conclusively worked out, and its essential cause has been shown to be loss of function of the thyroid gland.

The condition has existed and been described in far back ages, but mingled with so many other entirely different deformities and degenerations that it is now often almost impossible to classify them satisfactorily. The following is a vivid picture by Beaupré (*Dissertation sur les crétins*, translated in Blackie on *Cretinism*, Edin., 1855):—

“I see a head of unusual form and size, a squat and bloated face, a stupid look, bleared hollow and heavy eyes, thick projecting eyelids, and a flat nose. His face is of a leaden hue, his skin dirty, the usual hue of goitre, from which the每一次 begins down over his moist livid lips. His mouth, always open and full of saliva, shows teeth going to decay. His chest is narrow, his back curved, his breath asthmatic, his limbs short, misshapen, without power.

“His voice is extremely low, and his words are thick; the voice is also breathless, the voice has difficulty, the large high drops listlessly on the breast; the abdomen is like a bag.”

When fully grown the height rarely exceeds 4 ft., and is often less than 3 ft. The skin feels doughy from thickening of the subcutaneous tissues, and it hangs in folds over the abdomen and the bends of the joints. Very frequently there is an umbilical hernia. The hair has a far greater resemblance to horse-hair than to that of a human being, and is usually absent on the body of an adult cretin. The temperature is subnormal, and the exposed parts tend to become blue in cold weather. The blood is usually deficient in haemoglobin, which is often only 40-50% of the normal. The mental capacity varies within narrow limits; an intelligent adult cretin may reach the intellectual development of a child 3-4 years of age, though more often the standard attained is even below this. The child cretin learns neither to walk nor talk at the usual time. Often it is unable to sit without support. Some years later a certain power of movement is acquired, but the gait is waddling and clumsy. Speech is long delayed, or in bad cases may be almost entirely lacking. The voice is usually harsh and unpleasant. Of the senses smell and taste are but slightly developed, more or less deafness is generally present, and only the sight is fairly normal. In the adult the genital organs remain undeveloped. If the cretin is untreated he rarely has a long life, thirty years being an exceptional age. Death results from some intercurrent disease.

Cretinism has to be distinguished from the state of a Mongolian idiot, in whom there is no thickening of the subcutaneous tissues, and much greater alertness of mind; from achondroplasia, in which condition there is usually no mental impairment; and from infantilism, which covers a group of symptoms whose only common point is that the primary and secondary sexual characteristics fail to appear at the proper time.

Before 1881 there was no treatment for this disease. The patients lived in hopeless imbecility until their death. But in that year Dr George Murray published his discovery of the effect of hypodermic injections of thyroid gland extract in cases of myxoedema. In the following year Drs Hector Mackenzie, E. L. Fox of Plymouth, and Howitz of Copenhagen, each working independently, showed the equally potent effect of the gland administered by the mouth. The remedy was soon
after applied to cretinism and its effects were found to be even more wonderful. It has to be used, however, with the greatest care and discrimination, since personal idiosyncrasy seems to be a very variable factor. Even small doses, if beyond the patient's power, may produce fever, excitement, headache, insomnia and vomiting. The administration must be persisted in throughout life, otherwise myxoedematous symptoms appear. The first most apparent results are those of growth, and this may supervene even in patients up to 25-30 years of age. Once started, 4 to 6 in. may be gained in stature in the first year's treatment, though this is usually in inverse ratio to the age of the patient, and also diminishes in later stages of treatment. In young adolescents it may be so rapid that the patient has to be kept lying down to prevent permanent bending of the long bones of the leg, softened by their rapid growth. A very typical case under Dr Hector Mackenzie, showing what can be expected from early treatment, is that of a cretin aged 11 years in 1853, when thyroid treatment was started. He grew very rapidly, and became a normal child, passed through school, and in 1868 was at one of the universities.

"Organotherapy," "Textbook of Pharmacology and Therapeutics (1901); Weygandt, Der heutige Stand der Lehre vom Cretinismus" (Halle, 1901); Hector Mackenzie, "Cretinism," Allbutt & Rolleston's System of Medicine (1895).

CRETONE, originally a strong, white fabric with a hempen warp and linen weft. The word is said to be derived from Cret, a village in Normandy where the manufacture of linen was carried on. It is now applied to a strong, printed cotton cloth, stouter than chintz but used for very much the same purposes. It is usually unglazed and may be printed on both sides and even with different patterns. Frequently the cretone has a woven fancy pattern of some kind which is modified by the printed design. It is sometimes made with a weft of cotton waste.

CREUSE, a department of central France, comprising the greater part of the northern province of Marche, together with portions of Berry, Bourbons, Auvergne, Limousin and Poitou. Area, 2104 sq. m. Pop. (1906) 274,094. It lies on the north-western border of the central plateau and is bounded N. by the departments of Indre and Cher, E. by Allier and Puy-de-Dôme, S. by Corrèze and W. by Haute-Vienne. The surface is hilly, with a general inclination north-westward in the direction of the valley of the Creuse, sloping from the mountains of Auvergne and Limousin, branches of which project into the south of the department. The chief of these starts from the Plateau de Gentieux, and under the name of the Mountains of Marche extends along the left bank of the Creuse. The highest point is in the forest of Châteauvert (3050 ft.) in the extreme south-east of the department. Rivers, streams and lakes are numerous, but none are navigable; the principal is the Creuse, which rises on the north side of the mass of Mount Oudouze on the border of the department of Corrèze, and passes through the department, dividing it into two nearly equal portions, receiving the Petite Creuse from the right, and afterwards flowing on to join the Vienne. The valleys of the head-streams of the Cher and of its tributary the Tardes, which near Évux pass under a fine viaduct 300 ft. in height, occupy the eastern side; those of the heads of the Vienne and its tributary the Thurion, and of the Garmente joining the Creuse, are in the west of the department. The climate is in general cold, moist and variable; the rigorous winter covers the higher cantons with snow; rain is abundant in spring, and storms are frequent in summer, but the autumn is fine. Except in the valleys the soil is poor and infertile, and agriculture is also handicapped by the dearness of labour, due to the annual emigration of from 15,000 to 20,000 of the inhabitants to other parts of France, where they serve as stonemasons, &c. The produce of cereals, chiefly rye, wheat, oats and buckwheat, is not sufficient for home consumption. The chestnut abounds in the north and west; hemp and potatoes are also grown. Cattle-rearing and sheep-breeding are the chief industries of the department, which supplies Poitou and Vendée with draught oxen. Coal is mined to some extent, chiefly in the basin of Ahun. There are thermal springs at Évau in the east of the department, where remains of Roman baths are preserved. The chief industrial establishments are the manufactories of carpets and hangings and the dyeworks of Aubusson and Felletin. Saw-mills and the manufacture of wooden shoes and hats have some importance. Exports include carpets, coal, live-stock and hats; imports comprise raw materials for the manufactories and food-supplies.

The department is served by the Orléans railway company, whose line from Montluçon to Périgueux traverses it from east to west. It is divided into the four arrondissements of Guéret, the capital Aubusson, Bourganeuf, and Boussac, and further into 25 cantons and 266 communes. With Haute-Vienne, Creuse forms the diocese of Limoges, where also is its court of appeal. It forms part of the académie (educational division) of Clermont and of the region of the XIII. army corps. The principal towns are Guéret and Aubusson. La Souterraine, Chambron-sur-Vouéze and Bénévent-l’Abbaye possess fine churches of the 12th century. At Moutier-d’Ahun there is a church, which has survived from a Benedictine abbey.

The nave of the 13th century with a fine portal, and the choir with its carved stalls of the 17th century, are of considerable interest.

The small industrial town of Bourganeuf has remains of a priory, including a tower (13th century) in which Zizim, brother of the Sultan Bajazet II, is said to have been imprisoned.

CREUTZ, GUSTAF FILIP, Count (1729-1785), Swedish poet, was born in Finland in 1729. After concluding his studies in Åbo he received a post in the court of chancery at Stockholm in 1751. Here he met Count Gyllenborg, with whom his name is indissolubly connected. They were closely allied with Fru Nordenflycht, and their works were published in common; to their own generation they seemed equal in fame, but posterity has given the palm of genius to Creutz. His greatest work is contained in the 1762 volume, the idyll of Atis och Camilla; the exquisite little pastoral entitled "Daphne" was published at the same time, and Gyllenborg was the first to proclaim the supremacy of his friend. In 1763 Creutz practically closed his poetical career; he went to Spain as ambassador, and after three years to Paris in the same capacity. In 1783 Gustavus III. recalled him and heaped honours upon him, but he died soon after, on the 30th of October 1785. Atis och Camilla was long the most admired poem in the Swedish language; it is written in a spirit of pastoral which is now to some degree faded, but in comparison with most of the other productions of the time it is freshness itself. Creutz introduced a melody and grace into the Swedish tongue which it lacked before, and he has been styled "the last artificer of the language."

See Creutz och Gyllenborgs Vitterhetsarbeten (Stockholm, 1795).

CREUZER, GEORG FRIEDRICH (1771-1838), German philologist and archaeologist, was born on the 10th of March 1771, at Marburg, the son of a bookseller. Having studied at Marburg and Jena, he for some time lived at Leipzig as a private tutor; but in 1802 he was appointed professor at Marburg, and two years later professor of philology and ancient history at Heidelberg. The latter position he held for nearly forty-five years, with the exception of a short time spent at the university of Leiden. The health of his health was affected by the Dutch climate. He was one of the principal founders of the Philological Seminary established at Heidelberg in 1807. The Academy of Inscriptions of Paris appointed him one of its members, and from the grand-duke of Baden he received the dignity of privy councillor. He died on the 16th of February 1838. Creuzer's first and most famous work was his Symbolik und Mythologie der alten Völker,
besonders der Griechen (1830-1812), in which he maintained that the mythology of Homer and Hesiod came from an Eastern source through the Pelasgians, and was the remains of the symbolism of an ancient revelation. This work was vigorously attacked by Hermann in his Briefen über Homer und Hesiod, and in his letter, addressed to Creuze, Über das Wesen und die Behandlung der Mythologie; by J. H. Voss in his Antisymbolik; and by Lobek in his Aglaophamus. Of Creuer's other works the principal are an edition of Plotinus; a partial edition of Cicero, in preparing which he was assisted by Moser; Die historische Kunst der Griechen (1803); Epochen der griech. Literaturgeschichte (1802); Abriss der römischen Antiquitäten (1824); Zur Geschichte altägyptischen Cultur am Oberrein und Neckar (1833); Zur Gemmenkunde (1854); Das Mithreum von Neuenheim (1838); Zur Gallerei der alten Dramatiker (1839); Zur Geschichte der klassischen Philologie (1854).

See the autobiographical Aus dem Leben eines alten Professors (Leipzig and Darmstadt, 1848), to which was added in the year of his death Paralipomena der Lebensskizze eines alten Professors (Frankfort, 1858); also Starck, Friedrich Creuzer, sein Bildungsgang und seine bleibende Bedeutung (Heidelberg, 1875).

CREVILLENTE, a town of eastern Spain, in the province of Alicante, and on the Murcia-Alicante railway. Pop. (1900) 10,726. Crevillente is a picturesque old town built among the eastern foothills of the Sierra de Crevillente. Its flat-roofed Moorish houses are enclosed by gardens of cactus, dwarf palm, orange and other subtropical plants, interspersed with masses of rock. The surrounding country, though naturally sterile, is irrigated from two adjacent springs, which differ in temperature by no less than 25° F. The district is famous for its melons, and also produces wine, olives, wheat and esparto grass. Local industries include the manufacture of coarse cloth, esparto fabrics, oil and flour.

CREW, NATHANIEL CREW, 3rd Baron (1633-1721), bishop of Durham, was a son of John Crew (1658-1679), who was created Baron Crew of Steine in 1661, and a grandson of Sir Thomas Crew (1656-1654), speaker of the House of Commons. Born on the 31st of January 1633, Nathaniel was educated at Lincoln College, Oxford, and was appointed rector of the college in 1688. He became dean and preacher of Chichester in 1660, clerk of the closet to Charles II. shortly afterwards, bishop of Oxford in 1671, and bishop of Durham in 1674. He owned his rapid preferment to James, then duke of York, whose favour he had gained by conning at the duke's leanings to the Roman Church. After the accession of James II. Crew received the deanery of the Chapel Royal. He served in 1686 on the revived ecclesiastical commission which suspended Compton, bishop of London, and then shared the administration of the see of London with Spratt, bishop of Rochester. In 1687 he was a member of another ecclesiastical commission, which suspended the vice-chancellor of the university of Cambridge for refusing the degree of M.A. to a monk who would not take the customary oaths. On the decease of James's power Crew dissociated himself from the court, and made a bid for the favour of the new government by voting for the motion that James had abdicated. He was excepted from the general pardon of 1690, but afterwards was allowed to retain his see. He left large estates to be devoted to charitable ends, and his benefaction to Lincoln College and to Oxford University is commemorated in the annual Crewian oration. In 1697 Crew succeeded his brother Thomas as 3rd Baron Crew. He died on the 18th of September 1721, when the barony became extinct.

CREW (sometimes explained as a sea term of Scandinavian origin, cf. O. Icel. kræ, a swarm or crowd, but now regarded as a shortened form of acre, acrewe, used in the 16th century in the sense of a reinforcement, O. Fr. acrewe, from accroître, to grow, increase), a band or body of men associated for a definite purpose, a gang who jointly carry out a particular piece of work, and especially those who man a ship, exclusive of the captain, and sometimes also of the officers.

CREWE, ROBERT OFFLEY ASHBURTON CREWE-MILNES, 1st Earl of (1850-1931), English statesman and writer, was born on the 27th of January 1850, being the son of Lord Houghton (q.v.), and was educated at Harrow and Trinity, Cambridge. In 1880 he married Sibyl Marcia Graham, who died in 1887, leaving him with two daughters. He inherited his father's literary tastes, and published Stray Verses in 1890, besides other miscellaneous literary work. A Liberal in politics, he became private secretary to Lord Granville when secretary of state for foreign affairs (1883-1884), and in 1886 was made a lord-in-waiting. In the Liberal administration of 1892-1895 he was lord- lieutenant for Ireland, having Mr John Morley as chief secretary. In 1895 he was created 1st earl of Crewe, his maternal grandfather, the 2nd Baron Crewe, having left him his heir. In 1899 he married Lady Margaret Primrose, daughter of the 7th earl of Rosbery. In 1905 he became lord president of the council in the Liberal government; and in 1908, in Mr Asquith's cabinet, he became secretary of state for the colonies and Liberal leader in the House of Commons.

CREWE, a municipal borough in the Crewe parliamentary division of Cheshire, England, 158 m. N.W. of London, on the main line of the London & North-Western railway. Pop. (1901) 42,074. The town was built on an estate called Oak Farm in the parish of Monk's Coppedhall, and takes its name from the original stations having been placed in the township of Crewe, in which the seat of Lord Crewe is situated. It is a railway junction where lines converge from London, Manchester, North Wales and Holyhead, North Stafford and Hereford. It is inhabited principally by persons in the employment of the London & North-Western railway company, and was practically created by that corporation, at a point where in 1841 only a farmhouse stood in open country. Crewe is not only one of the busiest railway stations in the world, but is the locomotive metropolis of the London & North-Western company, which has centred here enormous workshops for the manufacture of the material and plant used in railways. In 1901 the 400th locomotive was turned out of the works. A series of subterranean ways extending many miles have been constructed to enable merchandise traffic to pass through without interfering with passenger trains on the surface railways. The company possesses one of the finest electric stations in the world, and electrical apparatus for the working of train signals is in operation. The station is fitted with an extensive suite of offices for the interchange of postal traffic, the chief mails to and from Ireland and Scotland being stopped here and arranged for various distributing centres. Its enormous railway facilities and its geographical situation as the junction of the great trunk lines running north and south, tapping also the Staffordshire potteries on the one side and the great mineral districts of Wales on the other, constitute Crewe station one of the most important links of railway and postal communications in the kingdom. The railway company built its principal schools, provided it with a mechanics' institute, containing library, science and art classes, reading rooms, assembly rooms, &c. Victoria Park, also the gift of the company, was opened in 1888. The municipal corporation built the technical school and school of art. The borough incorporated in 1877, is under a mayor, 7 aldermen and 21 councillors. Area, 2185 acres.
Crewkerne, a market town in the southern parliamentary division of Somersetshire, England, 137 m. W.S.W. of London by the London & South-Western railway. Pop. of urban district (1901) 4,246. It is pleasantly situated in a wooded hollow, in the upper valley of the river Parret. The church of St Bartholomew, one of the finest in the county, is in the Perpendicular style characteristic of the district. The ornamentation throughout is beautiful, and the west front especially notable. The grammar school dates from 1499, but occupies modern buildings.

Sail-cloth, horsehair, cloth and webbing are manufactured.

Crib (a common word to some Teutonic languages, cf. Dutch krib and Ger. Krippe; it has a common origin with the O. Eng. "cratch," a manger or crib, cf. Fr. crèche), a manger or framework receptacle for holding fodder for cattle and horses, and so, from early times in English, particularly the manger in which Jesus was laid. It is thus used of a "cradle," from which in form it should be distinguished as being a small bed with high closed-in sides. The word has many transferred meanings, as a rough, small hut or dwelling, from which comes the slang use of "crib" as a berth or situation, or, as a burglar's term for a house to be broken into; also, technically, in engineering for a timber bearing on foundations below water, or in mining for a timber lining to a shaft. "Crib-bitings" is a vicious habit in horses, probably due in the first instance to indigestion; the horse seizes the manger or other object in its teeth, and draws in the breath, known as "wind-sucking"; the habit may be checked by the use of a throat-strap. The slang meaning of the verb "crib," to steal, especially used of petty thievery, is probably derived from an obsolete use of the substantive for a small wicker basket; this meaning occurs in the expression "time-cribbing," used of an illicit increase of the hours of labour in a factory or workshop, especially by the running of machinery each day slightly beyond the time of ceasing work. "Crib" and "cribbing" in this sense are also applied to any unacknowledged appropriation or plagiarism from an author, and particularly to the secret copying by a schoolboy of another's work or from a book, and also to the secret use of a translation and to such translation itself. "Crib," in the game of cribbage, of which it is a shortened form, is the term for the cards thrown away in playing the score for a player.

Cribbage. A very similar game called "Noddy" was formerly played, the game being fifteen or twenty-one up, marked with counters, occasionally by means of a noddy board. Cribbage seems to be an improved form of Noddy. According to John Aubrey (Brief Lives) it was invented by Sir John Suckling (1609-1642).

A complete pack of fifty-two cards is required, and a cribbage board for scoring, drilled with sixty holes for each player and one hole (called "the game hole") at each end, the players usually scoring from opposite ends. Each player has two scoring pegs. The game is marked by inserting the pegs in the holes, one after the other, as the player makes a fresh score, commencing with the outer row at the game-hole end and going up the board. When the thirtieth hole is reached the player comes down the board, using the inner row of holes, until he places his foremost peg in the game-hole. If the losing player fails to obtain half the holes, his adversary wins a "lurch," or double game.

The game may be played by two players, five or six cards being dealt to each, and taking out two for what is called "crib," or by three players (with one cribber) or five cards being dealt to each, putting out one for the crib, and a card from the top of the pack being dealt to complete the crib; or by four players (two being partners against the other two, sitting and playing as at whist, and one partner scoring for the other). The players cut for deal, the lowest dealing. If more than one game is played, the winner of the last game deals. The cards rank from king (highest) to the ace (lowest). At the two-handed five-card game, the non-dealer scores three holes (called "three" for last") at any time during the game, but usually while the dealer is dealing the first hand. This is not part of the six-card game, which we take as our example.

The dealer deals six cards to each, singly. The undated cards are placed face downwards on the table. The players then look at their hands and "lay out," each putting two cards face downwards on the table, on the side of the board nearest to the dealer, for the "crib." A player must not take back into his hand a card he has laid out if the cards have been covered, nor must the crib be touched during the play of his hand.

After laying out, the non-dealer (when more than two play, the player to the dealer's left) cuts the pack, and the dealer turns up the top card of the lower packet, called the "start," or "turn-up." If this is a knave, the dealer marks two "for his heels." This score is forfeited if not marked before the dealer plays a card.

The non-dealer plays first by laying face upwards on the table one of the cards from his hand; the dealer then does the same, and so on alternately. When none has a card that may play, the player to the leader's left plays the second card, and so on. As soon as the first card is laid down the player calls out the number of pips on it; if a picture card, ten. When the second card is laid down, the player calls out the sum of the pips on the two cards played, and so on until all the cards are played, or until neither player can play without passing the number thirty-one. If one player has a card or cards that will come in and the other has not, he is at liberty to play them; at the six-card game he must play as long as they can come in, and he can score runs or make pairs, &c., with them. If one player's cards are exhausted, the adversary plays out his own, and can score with them. When more than two play, the player next in rotation is bound to play, and so on until no one can come in. At the two-handed five-card game, when neither can come in the play stops; at the other games, the cards are played turned down, and the remainder of the cards are played in rotation, and so on until all are played out.

The object of the play is to make pairs, fifteens, sequences, and the "go," and to prevent the adversary from scoring.

Pairs.—If a card is put down of the same denomination as the one last played, the player pairing scores two holes. If a third of the same sequence is added, a score of four is added to any pair; thus if a pair are ten, and they are all tenth pips, a break is made, and the maker scores six holes. If a fourth card of the same denomination is next played, twelve holes are scored for the double pair royal. Kings pair only with kings, queens, and so on with knaves and tens, notwithstanding that they all count ten in play.

Fifteens.—If either player during the play reaches fifteen exactly, by reckoning the values of all the played cards, he marks two.

Sequence.—If during the play cards are consecutively played which make an ascending or descending sequence, the maker of the sequence marks one hole for each card forming the sequence or run. King, queen, knave and ten reckon one each in this order, in the play of a king, queen, knave, and ten and the break is filled "p" during the play, without the intervention of a card not in sequence, the player of the card that fills the break scores a run. Thus the cards are played in this order: A-4, B-3, A-2, B-ace, A gets a run of three, B a run of four. Had B’s last ace been a four, he would have scored a run of three. The cards need not be played in order. Thus the cards being played in this order, A-4, B-2, A-5, B-3, A-6, A-9, B-2, B-5, B-6, B-ace, A gets a run of three, B a run of five, and so on. B then playing the deuce has no run, as the deuce previously played intervenes. Again, if the cards at six-card cribbage are thus played, A-4, B-2, A-3, B-ace, A-5, B-2, A-ace, A takes a run of three, B a run of five, and so on; B then playing the deuce has no run, as the deuce previously played intervenes. If thirty-one is reached exactly, it is a go of two instead of one. After a go no card already played can be counted for pairs or sequences.
CRICCIETH—CRICHTON

Compound Scores. — More than one of the above scores can be made at the same time. Thus a player pairing with the last card that will come in scores both pair and go. Similarly a pair and a fifteen, or a sequence and a fifteen, can be reckoned together.

When the play is over, the hands are shown and counted aloud. The hand afterwards counts, scores and marks marks what he has in hand, and then takes what is in crib. In counting both hands and crib the "start" is included, so that five cards are involved.

The hand on which each entitle to a score are fifteen, pairs or pairs royal, sequences, flushes and "his nob."

Fifteens. — All the combinations of cards that, taken together, make fifteen exactly, count two. For example, a ten (King, Queen, Knave) and a nine makes three cards. Another five in the hand or turned up would again combine with the ten card, and entitle to another fifteen ("fifteen four"); if the other cards were a two and a three, two other fifteen would be counted ("fifteen six"); fifteen eight or crib, for the combination of the three last cards and one, and for the combination of the two fives with the three and two. Similarly two ten cards and two fives reckon eight; a nine and three threes count six; and so on for other cards.

Pairs. — Pairs are reckoned as in play.

Sequences. — Three or more cards in sequence count one for each. If one sequence card can be substituted for another of the same denomination, the sequence reckons again. For example, 3, 4 and 5, and 4, 5, and 6, with another 3, there would be three sequences of three, and so on.

Flushes. — If all the cards in hand are of the same suit, one is reckoned for each card. If the start is also of the same suit, one is reckoned for the fourth card, and two for the fifth. If the start is of the same suit as the cards in crib.

This Nob. — If a player holds the knave of the suit turned up for the start he counts one "for his nob."

A dialogue card, and is the technical conversation of the game, in a game at six-card cribbage. The cards for crib having been discarded, A holds knave of hearts, a four and a pair of twos: B holds a pair of nines, a six and a four: two of hearts is turned up by B. A may play the eight or the nine: if he play the nine, A folds down the two and says: "Two and nine, and says: Eleven." A follows with a four, saying "Fifteen two." Pegging two holes at once, B plays his four and says: "Nineteen; two for a pair," and pegs: A putting on his knave, "Twenty-nine; two for a pair," and pegs; A laying two, "Thirty-one; good for two," B plays his nine and six, saying: "Fifteen two, and on for my last—three." The points are marked as they are made. Then A counts his hand aloud. Six for a pair—royal, or Three twos—good for six, and One for his nob—seven, and then he in his hand for B's inspection. B, "Fifteen two, fifteen four, fifteen six, fifteen eight, and a pair are ten." B then looks at his crib and counts it. It contains, say, king, eight, three, ace and on for the "start" is also reckoned. B counts, takes a run of threes and a run of fives, and a five of the same suit as the knave, turned up.

CRICCIETH, a watering-place and contributory parliamentary borough of Carnarvonshire, Wales, on Cardigan Bay, served by the Cambrian railway. Pop. of urban district (1901) 1466. It is interesting for its high antiquity and the ruined castle, a fortress on an eminence where a neck of land ends, projecting into the sea. Portions of two towers are on the very verge of the rock. A double fosse and vallum, with the outer and inner court lines, can be traced. Apparently British, the castle was repaired later, probably in the time of Edward I. Across the bay is seen Harlech castle, backed by the Merionethshire hills. An old county-family mansion near Criccieth is Gwynfryn (happy hill), the seat of the Nannyes, situated near the stream Dwyfawr and within some 7 m. of Pwllheli. Not far is a tumulus, Tomen fawr. At a distance of 5 m. is Tremadoc (which owes its name, Tremadoc, to Sir W. Madocks, or Morfa Lodge, who made the embankment here). Criccieth has become a favourite watering-place, as well as a centre of excursions. The neighbourhood is agreeable, and the Cardigan Bay shore is shelving and suitable for safe bathing. Cantrefy Gwaelod (the hundred of the bottom) is the Welsh literary name of this bay, on the shores of which geological depression has certainly taken place. Mythical history relates how Seithenin’s drunkenness inundated the land now covered by the bay, and how King Arthur’s ship was wrecked upon Maelstrond Enli near Bardsey. The Mabinogion tells how Harlech was a port. Similarly, in Carnarvon Bay, about 2 m. seaward, at low water, are visible the ruins of Caerarvonbod (fortified town of the silver wheel), a submerged town—due to another geological depression.

CRICHTON, JAMES (1567–1582), commonly called the "Admirable Crichton," was the son of Robert Crichton, lord advocate of Scotland in the reign of Mary and James VI., and of Elizabeth, daughter of Sir James Stewart of Beath, through whom he claimed royal descent. He was born probably at Elicock in Dumfriesshire in 1560, and when ten years old was sent to St Salvador’s College, St Andrews, where he took his B.A. in 1574 and his M.A. in 1575. In 1577 Crichton was undoubtedly in Paris, but his career on the continent is difficult to follow. That he displayed considerable classical knowledge, was a good linguist, a ready and versatile writer of verse, and above all that he possessed an astounding memory, seems certain, not only from the evidence of men of his own time, but from the fact that even Joseph Scaliger (Prima Scaligerana, p. 58, 1660) speaks of his attainments with the highest praise. But those works of his which have come down to us show few traces of unusual ability; and the laudation of him as a universal genius by Sir Thomas Urquhart and Aldus Manutius requires to be discounted. Urquhart (in his dedication of a book to Crichton) tells us that "Mr Paris Crichton successfully held a dispute in the college of Navarre, on any subject and in twelve languages, and that a few days after he had a tilting match at the Louvre. There is, however, no contemporary evidence for this, the only certain fact being that for two years Crichton served in the French army, and that in 1579 he arrived in Genoa. The latter event is proved by a Latin address (of no particular merit) to the Doge and Senate entitled Oratio J. Critonii Scoti pro Moderatorum Genuesi Reipubl. electione coram Senatu habita . . . (Genoa, 1570). The next year Crichton was in Venice, and won the friendship of Aldus Manutius by his Latin ode In appusul ad urbem Venetam de Proprio statu J. Critonii Scoti Carmen ad Aldum Manuccium . . . (Venice, 1580). The best contemporary evidence for Crichton's stay in Venice is a handbill printed by the Guerra press in 1580 (and now in the British Museum), giving a short biography and an extravagant eulogy of his powers; he speaks ten languages, has a command of philosophy, theology, mathematics; he improvises Latin verses in all metres and on all subjects, has all Aristotle and Plato and the commentaries of the Scholastics and the fathers of the church, a handle to the most difficult historical and geographical questions, a soldier from top to toe, &c. This work is undoubtedly by Manutius, as it was reprinted with his name in 1581 as Relatione della qualità di . . . Crettone, and again in 1582 (reprinted Venice, 1581).

In Venice Crichton met and vanquished all disputants except Giacomo Massonzi, was followed from place to place by crowds of admirers, and won the affection of the humanists Lorenzo Massa and Giovanni Donati. In March 1581 he went to Padua, where he held two great disputations. In the first he expounded in succession a Latin poem, a daring onslaught on Aristotelian ignorance, and an oration in praise of ignorance. In the second, which took place in the Church of St John and St Paul, and lasted three days, he undertook to refute innumerable errors in Aristotelians, mathematicians and schoolmen, to conduct his dispute either logically or by the secret doctrine of numbers, &c. According to Aldus, who attended the debate and published an account of it in his dedication to Crichton prefixed to Cicero's "Paradoxa" (1581), the young Scotman was completely successful. In June Crichton was once more in Venice, and while there wrote two Latin odes to his friends Lorenzo Massa and Giovanni Donati, but after this date the details of his life are obscure. Urquhart states that he went to Mantua, became the tutor of the young prince of Mantua, Vincenzo di Gonzaga, and was killed by the latter in a street quarrel in 1582. Aldus in his edition of Cicero’s De universitate (1583), dedicated to Crichton, laments the 3rd of July as the fatal day; and this account is apparently confirmed by the Mantuan state papers recently unearthed by Mr Douglas Crichton (Proc. Soc. of Antiquaries of Scotland, 1909). Mr Sidney Lee (Dict. Nat. Biol.) argued against this date, on the ground that in 1584 and 1585 Crichton was alive and in Milan, as certain works of his published in that year testified,
CRICKET

CRICKET. The game of cricket may be called the national summer pastime of the English race. The etymology of the word itself is the subject of much dispute. The Century Dictionary connects with O. Fr. criquet, "a stick used as a mark in the game of bowls," and denies the connexion with A.S. crice or cryce, a staff. A claim has also been made for cricket, meaning a stool, from the stool at which the ball was bowled, while in the wardrobe account of King Edward I. for the year 1300 (p. 126) is found an allusion to a game called creag. Skeat, in his Etymological Dictionary, states that the word is probably derived from A.S. crice (repudiated by the first authority quoted), the meaning of which is a staff, and suggests that the "et" is a diminutive suffix; the word is of the same origin as "crutch." Finally the New English Dictionary traces the O. Fr. criquet, defined by Littre as "jeu d'adresse," to M. Flem. Krick, Krücke, baston à s'appuyer, quinte, polence.

History.—In a MS. of the middle of the 13th century, in the King's library, 14 Bv, entitled Chronique d'Angleterre, depuis Ethelberd jusqu'Hen. III., there is found a grotesque delineation of two male figures playing a game with a bat and ball. This is undoubtedly the first known drawing of a game destined to develop into the scientific cricket of modern times. The left-hand figure is that of the batsman, who holds his weapon upright in the right hand with the handle downwards. The right-hand figure shows the catcher, whose duty is at once apparent by the extension of his hands. In another portion of the same MS., however, there is a male figure pointing a bat towards a female figure in the attitude of catching, but the ball is absent. In a Bodleian Library MS., No. 264, dated the 18th of April 1344, and entitled Romance of the Good King Alexander, fielders for the first time appear in addition to the batsman and bowler. All the players are monks (not female figures, as Strutt misinterprets their dress in his Sports and Pastimes), and on the extreme left of the picture, the bowler, with his cowl up, poises the ball in the right hand with the arm nearly horizontal. The batsman comes next with his cowl down, a little way only to the right, standing sideways to the bowler with a long roughly-hewn and slightly-curved bat, held upright, handle downwards in the left hand. On the extreme right come four figures—with cows alternately down and up, and all having their hands raised in an attitude to catch the ball. It has been argued that the bat was always held in the left hand at this date, since on the opposite page of the same MS. a solitary monk is figured with his cowl down, and also holding a somewhat elongated oval-shaped implement in his left hand; but it is unsafe to assume that the accuracy of the artist can be trusted.

The close roll of 39 Edw. III. (1365), Men. 23, disparages certain games on account of their interfering with the practice of archery, where the game of cricket is probably included among the pastimes denounced as "ludus inonestos, et minus utiles ut valentes." In this instance cricket was clearly considered fit for the lower orders only, though it is evident from the entry in King Edward's wardrobe account, already mentioned, that in 1300 the game of creag was patronized by the nobility. Judging from the drawings, it can only be conjectured that the game consisted of bowling, batting, and fielding, though it is known that there was an in-side and an out-side, for sometime during the 15th century the game was called "Hondyn or Hondoute," or "Hand in and Hand out." Under this title it was interdicted by 17 Edw. IV. c. 3 (1477-1478), as one of those illegal games which still continued to be so detrimental to the practice of archery. By this statute, any one allowing the game to be played on his premises was liable to three years' imprisonment and £20 fine, any player to two years' imprisonment and £10 fine, and the implements to be burnt. The inference that hand in and hand out was analogous to cricket is made from a passage in the Hon. Daines Barrington's Observations on the more Ancient Statutes from Magna Charta to 21 James I. cap. 27. Writing in 1766, he comments thus on the above statute, viz.: "This is, perhaps, the most severe law ever made against gaming, and some of these forbidden sports seem to have been manly exercises, particularly the handyn and handoute, which I would suppose

regarded it as probable that he died in Mantua c. 1585/6. But these later works seem to have been by another man of the same name. The epithet "admirable" (admirabilis) for Crichton first occurs in John Johnston's Heroes Scoti (1603). It is impossible to recover the whole truth either as to Crichton's death or as to the extent of his attainments, which were so quickly elevated into legendary magnitude.

BIBLIOGRAPHY.—Sir Thomas Urquhart's Discovery of a most excellent jewel (1652; reprinted in the Maitland Club's edition of Urquhart's Works in 1834) is written with the express purpose of glorifying Scotland. The pamphlets of Aldus Manutius require to be received with some caution, since he was given to exaggerating the merits of his friend, and uses almost the same language about a young Pole named Stanislaus Negosevski; see John Black's Life of Tocque (1811); The Life of Crichton, by P. Fraser Tytler (2nd ed., 1823), contains many extracts from earlier writers; see also "Notices of Sir Robert Crichton of Cluny and of his son James," by John Stuart, in Proceedings Soc. of Antiquaries of Scotland, vol. ii. pp. 103-118 (1855); and the article by Andrew Lang, "The death of the Admirable Crichton," in the Morning Post (London), Feb. 25, 1910. W. Harrison-Ainsworth in his novel Crichton (new ed., 1892) reprints and translates some documents relating to Crichton, as well as some of his poems.
to be a kind of cricket, as the term hands is still retained in that game."

The word "cricket" occurs about the year 1550. In Russell's History of Guildford it appears there was a piece of waste land in the parish of Holy Trinity in that city, which was enclosed by one John Parish, an innholder, some five years before Queen Elizabeth came to the throne. In 1553 (1593) evidence was taken before a jury and a verdict returned, ordering the garden to be laid waste again and disinclosed. Amongst other witnesses John Derrick, gent., and one of H.M.'s coroners for Surrey, et al., fifty-nine, deposed he had known the ground for fifty years or more, and "when he was a scholler in the free school of Guildford, he and several of his fellows did runne and play there at cricket and other plaiyes." In the original edition of Stow's Survey of London (1598) the word does not occur, though he says, "The ball is used by noblemen and gentlemen in tennis courts, and by people of the meaner sort in the open fields and streets."

Some noteworthy references to the game may be cited. In Giovanni Florio's dictionary A World of Words most Copious and Exact, published in Italy in 1595 and in London three years later, squallare is defined as "to make a noise as a cricket, to play cricket, or morrice-dancing."

According to W. Crosse in his Dictionary of English and French, dated 1611, Crosse is translated "crosier or bishop's staffe wherewith boys play at cricket," and Crosser "to play at cricket."

Among the earliest traces of cricket at public schools is an allusion to be found in the Life of Bishop Ken by William Lisle Bowles (1830). Concerning the subject of this biography, who was admitted to Winchester on the 13th of January 1660/1, it is said "on the fifth or sixth day, our junior . . . is found for the first time attempting to wield a cricket bat." In 1688 a "ram and bat" is charged in an Etonian's school bill, but it is possible this may only refer to a cudgel used for ram-haunting. In The Life of Thomas Wilson, Minister of Maidstone, published anonymously in 1672, Wilson having been born in 1601 and dying in or about 1653, occurs the following passage (p. 40): "Maidstone was formerly a very prosperous town, in as much as having morrice-dancing, cudgel-playing, stool-ball, crickets, and many other sports openly and publicly indulged in the Lord's Day." Cricket is found enumerated as one of the games of Gargantua in The Works of Rabelais, translated in 1653 by Sir Thomas Urquhart (Urquhart), vol. i. ch. xxi. p. 97. In a poem entitled The Mysteries of Love and Eloquence or the Arts of Wooing and Complimenting (1638), by Edward Phillips, John Milton's nephew, the mistress of a country bumpkin when she goes to a fair with him says "Would my eyes had beene beaten out of my head with a cricket bat." The St Alban's Cricket Club was founded in 1661, one of its earliest presidents being James Cecili, 4th earl of Salisbury (1666-1694).

In 1662 John Davies of Kidwelly issued his translation of Adam Olearius' work entitled The Voyages and Travels of the Ambassadors from the Duke of Holstein to the Grand Duke of Muscovy, and the King of Persia. Begun in the year 1633 and finished in 1639. On page 307 is a description of the exercises indulged in by the Persian grandees in 1637, and the statement is made that "They play there also at a certain game, which the Persians call Kuchelawak, which is a kind of Mall or Cricket." In the Clerkenwell parish book of 1668 the proprietor of the Rum Inn, Smithfield, is found rated for a cricket field.

The chaplain of H.M.S., "Assistance," Rev. Henry Teonge, states in his diary that during a visit to Antioch on the 6th of May 1676, several of the ship's company, accompanied by the consul, rode out of the city early and amongst other pastimes indulged in "cricket." During the first half of the 18th century the popularity of the game increased and is frequently mentioned by writers of the time, such as Swift, who alludes sneeringly to "footmen at cricket," D'Urfey, Pope, Soame Jenyns, Strype in his edition of Stow's Survey of London, and Arbuthnot in John Bull, iv. 4, "when he happened to meet with a football or a match at cricket."

In 1748 it was decided that cricket was not an illegal game under the statute 9 Anne, cap. 10, the court of king's bench holding "that it was a very manly game, not bad in itself, but only in the ill use made of it by betting more than ten pounds on it; but that was bad and against the law." Frederick Louis, prince of Wales, died in 1751 from internal injuries caused by a blow from a cricket ball whilst playing at Cliefden House. Games at this period were being played for large stakes, ground proprietors and tavern-keepers farming and advertising matches, the results of which were not always above suspicion. The old Artillery Ground at Finsbury was one of the earliest sites of this type of fixture. Here it was that the London Club—formed about 1700—played its matches. The president was the prince of Wales, and many noblemen were among its supporters. It flourished for more than half a century. One of the very earliest full-scores kept in the modern fashion is that of the match between Kent and All England, played on the Artillery Ground on the 1st of June 1743.

Cricket, however, underwent its most material development in the southern counties, more especially in the hop-growing districts. It was at the large hop-fairs, notably that of Weyhill, to which people from all the neighbouring shires congregated, that county matches were principally arranged.

The famous Hambledon Club lasted approximately from 1750 to 1791. Its matches were played on Broad Half-Penny and Windmill Downs, and in its zenith the club frequently contended with success against All England. The chief players were more or less retainers of the noblemen and other wealthy patrons of cricket. The original society was broken up in 1701 owing to Richard Nyren, their "general," abandoning the game, of which in consequence "the head and right arm were gone." The dispersion of the players over the neighbouring counties caused a diffusion of the best spirit of the game, which gradually extended northward and westward until, at the close of the 18th century, cricket became established as the national game, and the custom became general to play the first game of each year on Good Friday.

The M.C.C. (or Marylebone Cricket Club), which ranks as the leading club devoted to the game in any part of the globe, sprang from the old Artillery Ground Club, which played at Finsbury until about 1780, when the members migrating to White Conduit Fields became the White Conduit Cricket Club. In 1787 they were remodelled under their present title, and moved to Lord's ground, then on the site of what is now Dorset Square; thence in 1811 to Lord's second ground nearer what is now the Regent's Canal; and in 1814, when the canal was cut, to what is now Lord's ground in St John's Wood. Thomas Lord, whose family were obliged to leave their native Scotland on account of their participation in the rebellion of 1745, was born in Thirsk, Yorkshire, in 1757, and is first heard of as an attendant at the White Conduit Club, London, in 1780. Soon afterwards he selected and superintended a cricket ground for the earl of Winchilsea and other gentlemen, which was called after his name. He died in 1832 on a farm at West Meon, Hampshire, of which he took the management two years before. Lord took away the original turf of his cricket-ground at each migration and relaid it. In 1825 the pavilion was burnt down, invaluable early records of the game being destroyed; and in the same year the ground would have been broken up into building plots had not William Ward purchased Lord's interest. Dark bought him out in 1836, selling the remainder of his lease to the club in 1864. Meanwhile, in 1860, the freehold had been purchased at public auction by a Mr Marsden—né Moses—for £7000, and he sold it to the club six years later for nearly £18,500; a similar sum being paid in 1887 for additional ground. In 1897 the Great Central railway company conveyed a further portion to the club, making the ground complete as it now is; the total area is about 20 acres, including the site of various villas adjoining.
the ground which are part of the property. The number of members now considerably exceeds five thousand.

Laws.—The oldest laws of cricket extant are those drawn up by the London Club in 1744. These were amended at the “Star and Garter” in Pall Mall, London, in 1755, and again in 1774, and were also revised by the M.C.C. in 1788. From this time the latter club has been regarded as the supreme authority, even though some local modifications have in recent years been effected in Australia. Alterations and additions have been frequently made, and according to the present procedure they have to be approved by a majority of two-thirds of the members present at the annual general meeting of the whole club; the administration being in the hands of a president, annually nominated by his outgoing predecessor, a treasurer and a committee composed of sixteen members, four annually retiring, in conjunction with a secretary and a large subordinate staff.

 Implements.—Concerning the implements of the game, in the 1744 rules it was declared that the weight of the ball must be “between five and six ounces,” and it was not until 1774 that it was decided that it “shall weigh not less than five ounces and a half nor more than five ounces and three-quarters,” and it is to the latter that we are to refer in the absence of the addition, “it shall measure not less than nine inches nor more than nine inches and a quarter in circumference.” The materials out of which the old balls were made are not on record. At present a cube of cork forms the foundation, round which layers of fine twine and thin shavings of cork are accumulated until the proper size and shape are attained, when a covering of red leather is sewn on with six parallel seams. Various “compositions” have been tried as a substitute for cork and leather, but without taking their place.

For the bat, English willow has been proverbially found the best wood. The oldest extant bats resemble a broad and curved hockey stick, and it has been claimed to be an evolution of the club employed in the Irish game of “hurley.” The straight blade was adopted as soon as the bowler began to pitch the ball up, an alteration which took place about 1750, but pictures show slightly curved bats almost to the time of the battle of Waterloo. The oldest were all made in one piece and were so used until the middle of the 19th century, when handles of ash were inserted into the blade, and the whole cane-handle was introduced about 1860. No limit was set to the length of the bat until 1840, though the width was restricted to 44 in. “In the widest part” by the laws of 1788, and a gauge was made for the use of the Hambledon Club. The length of the bat is now restricted to 38 in., 36 being generally used, as a rule the handle being 14 in. long and the blade 22 in. As to weight, though there is no restriction, 2 lb 3 oz. is considered light, 2 lb 6 oz. fairly heavy; but W. Ward (1787-1840) used a bat weighing 4 lb.

At present the wicket consists of three stumps (round straight pieces of wood) of equal thickness, standing 27 in. upright out of the ground. On the top are two “bails,” short pieces of wood which fit into grooves made in the top of the stumps so as not to project more than half an inch above them. But the evolution of the wicket has been very gradual, and the history of it is very obscure, since different types of wickets seem to have existed simultaneously. If early pictures are to be trusted, no wicket was required in primitive times: the striker was either caught out, or run out, the fieldsman having to put the ball into a hole scooped in the ground, before the batsman could put his bat into it. A single stump, it is supposed, was sometimes substituted for the hole to save collision between the bat and the fieldsman’s fingers. In due course, but at an unknown date, a wicket—a “skeleton gate”—was raised over the hole; it consisted of two stumps each 12 in. high, set 24 in. apart, with a third laid on the top of them. John Nyren, however, writing in 1833, and discussing some memoranda given him by Mr W. Ward, says apropos of these dimensions, “There must be a mistake in this account of the width of the wicket.” Undoubtedly such wickets were all against the bowler, who must have bowled over or through the wicket twenty times for every occasion when he succeeded in hitting either the uprights or the cross stumps. In pictures of cricket played about 1774, we find only two stumps and a cross stumps, or ball, the wicket varying apparently both in height and width. In a picture, the property of H.M. the King, entitled “A Village Match in 1768,” three stumps and a ball are distinctly shown. Two wickets are shown as used in 1779, afterwards three always with one exception. Two prints, advertisements, representing matches played between women on consecutive days in 1811, show, one of them a wicket of three stumps, the other a wicket of two. The addition of the third stump, as is universally agreed, was due to an incident which occurred in a match of the Hambledon Club in 1775. “It was observed at a critical point in the game, that the ball passed three times between Mr Small’s two stumps without knocking off the ball; and then, first a third stump was added, and seeing that the new style of balls which rise over the bat also rise over the wicket, then but 1 ft. high, the wicket was altered to the dimensions of 22 in. by 8, and to its present dimensions of 27 in. by 8 in 1817.” So writes the Rev. J. Pycroft (1813-1895), quoting fairly closely from Nyren, who was in the company of Dyce, who was present and saw the change. The wording of writing 22 by 8, which should really be 22 by 6. It is hard to believe that the 12 by 24 wicket lasted as long as 1775, for in laws issued after the meeting held at the “Star and Garter,” Pall Mall, where many “noblemen and gentlemen” attended “finally to settle” the laws of the game, we read that the stumps are to be 22 in. and the ball 6. “N.B.—It is lately settled to use three stumps instead of two to each wicket, the ball the same length as before.” Regarding all the circumstances one is tempted to believe that Small defended a wicket of two stumps, 22 in. high and 6 in. apart, strange as is the circumstance that the ball should thrice in a short innings—for Small only made 14 runs—pass through them without dislodging the ball, even though the diameter of the ball is a trifle less than 3 in. Allusion is also found to a wicket 12 in. by 6, but it is hard to believe in its existence, unless it was used as a form of handicap. It should be recorded that in advertisements of matches about this time (1787) the fact that three wumps will be used “to shorten the game” is especially mentioned, and that the Hampshire Chronicle of the 15th of July 1797 records that “The Earl of Winchelsea has made an improvement in the game of cricket, by having four stumps instead of three, and the wickets 2 in. higher. The game is thus rendered shorter by easier bowling out.” In 1788, however, when the M.C.C. revised the laws, reference is made to stumps (no number given, but probably three) 22 in. high and a ball of 6 in. Big scoring in 1796 caused the addition next year of 2 in. to the height and of 1 to the breadth, making the wicket 24 in. by 7. That three stumps were employed is shown by a print of the medallion of the Oxfordshire County C.C. 1797, forming the frontispiece to Taylor’s Annals of Lord’s (1803). In 1817 the dimensions now in use were finally settled, three stumps 27 in. high, and a wicket 8 in. wide. Larger wickets have occasionally been used by way of handicap or experiment. The distance between the wickets seems always, or at least as far back as 1700, to have been 22 yds.—one chain.

The Game.—Cricket is defined in the New English Dictionary as “an open-air game played with bats, ball and wickets by two sides of eleven players each; the batsman defends his wicket against the ball which is bowled by a player of the opposing side, the other players of this side being stationed about the field in order to catch or stop the ball.” The laws define that the score shall be reckoned by runs. The side which scores the greatest number of runs wins the match. Each side has two innings taken alternately, except that the side which leads by 150 runs in a three days’ match or by 100 runs in a two days’ match or by 75 runs in a one day match shall have the option of requiring the other side to “follow their innings.” In England cricket is invariably played on turf wickets, but in the Colonies matting wickets are often employed, and sometimes matches have taken place on sand, earth and other substances. The oldest form of the game is probably single wicket, which consists of one
batsman defending one wicket, but this has become obsolete, though it was very popular in the time when matches were played for money with only one or two, or perhaps four or five, players on a side. Matches between an unequal number of players are still sometimes arranged, but mainly in the case of local sides against touring teams, or "colts" playing against eleven experienced cricketers. In any case two umpires are always appointed, and for English first-class county cricket these are now annually chosen beforehand by the county captains. Two scorers are officially recognized. All the arrangements as to scorecards, and accommodation for players, members of the club and general spectators, vary considerably according to local requirements. Between six and seven acres forms the most suitable area for a match, but the size of a cricket ground has never been defined by law.

The wickets are pitched opposite and parallel to one another at a distance of 22 yds.; the "bowling crease" being marked with whitewash on the turf on a line with the stumps 8 ft. 8 in. in length, with short "return creases" at right angles to it at each end; but the "popping crease," marked parallel to the wicket and 4 ft. in front of it, is deemed of unlimited length. The captains of the opposing sides toss for choice of innings, and the winner of the toss, though occasionally, owing to the condition of the ground or the weather prospects, electing to put his adversaries in first, as a general rule elects for his own side to bat first. The captain of the batting side sends his eleven (or whatever the number of his team may be) in to bat in any order he thinks best, and much judgment is used in deciding what this order shall be. Two batsmen with strong defensive powers and good nerve are usually selected to open the innings, the most brilliant run-getters immediately following them, and the weakest batsmen going in last. As there must always, except in the obsolete single-wicket cricket, be two batsmen in together, it follows that when ten of the side (in a side of eleven) have been put out, one of the final pair must be "not out," that is to say, put out not at all. The innings is terminated without his getting out because there is none of his side left to become his partner. The batsman who is thus "not out" is said to "carry his bat," a phrase that recalls a period when two bats sufficed for the whole side, each retiring batsman leaving the implement on the ground for the use of his successor, till at the close of the innings the "not out" man carried it back to the tent or pavilion. As the phrase is not also applied to the last batsman to get out, who would of course have carried the second bat off the ground, it was possibly at one time restricted to a player who going in first survived through the whole innings. It should be observed that the term "wicket" is used by cricketers in a number of different senses. Besides being the name given to the set of three stumps with their two balls when pitched for a match, it is in an extended sense applied to that portion of the ground, also called the "pitch," on which the stumps are pitched, with which is usually described being "in the wicket," a "sticky wicket," and so forth. It also in several idiomatic expressions signifies the getting out of a batsman and even the batsman himself, as in the phrases: "Grace lost his wicket without scoring," "Grace went in first wicket down," "when Grace got out England lost their best wicket," "England beat Australia by two wickets."

The umpires are required to decide questions arising in the course of play and to call the "overs," the "over" being a series of successive deliveries of the ball (usually six) by the bowler from one end of the pitch, the rest of the "out" side, or fielders, being stationed in various positions in the field according to well-defined principles. When an "over" has been bowled from one end a different bowler then bowls an "over" from the opposite end, the alternation being continued without interruption throughout the innings, and the bowlers being selected and changed from time to time by the captain of their side at his discretion, and the end of every over the fielders "change over" or otherwise rearrange their places to meet the batting from the other end. An over from which no runs are made off the bat is called a "maiden." A "run" is made when the two batsmen change places, each running from his own to the opposite wicket without being "run out." The aim of the batting side is to make as many runs as possible, while the object of the fielding side is to get their opponents out, and to prevent their making runs while in.

There are nine ways in which the batsman, or "striker," can be put out. Of these the following five are the most important. (1) The striker is "bowled" out if the bowler hits the wicket with the ball, when bowling, and dislodges the ball; (2) he is "caught" out if the ball after touching his bat or hand be held by any member of the fielding side before it touches the ground; (3) he is "stumped" out if the wicket-keeper dislodges the ball with the ball, or with his hand holding the ball, at a moment when the striker in playing at the ball has no part of his person or bat in contact with the ground behind the popping crease, i.e. when the batsman is "out of his ground"; (4) he is out "l.b.w." (leg before wicket) if he stops with any part of his person other than his hand, or arm below the elbow, a ball which in the umpire's judgment pitched straight between the wickets, and would have bowled the striker's wicket; (5) if when the batsmen are attempting to make a run the striker is put down (i.e. the ball dislodged) by the ball, or by the hand of any fieldman holding the ball, at a moment when neither batsman has any part of his person or bat on the ground behind the popping crease, the nearer of the two batsmen to the wicket so put down is "run out." The remaining four ways in which a batsman may be dismissed are (6) hit wicket, (7) handling the ball, (8) hitting the ball more than once "with intent to score," and (9) obstructing the field.

The positions of the fieldsmen are those which experience proves to be best adapted for the purpose of saving runs and getting the batsmen caught out. During the middle of the 19th century these positions became almost stereotyped according to the pace of the bowler's delivery and whether the batsmen were right or left-handed. A certain number of fielders stood on the "on" side, i.e., the side of the wicket on which the batsman stands, and a certain number on the opposite or "off" side, towards which the batsman faces. "Point" almost invariably was placed square with the striker's wicket some ten or a dozen yards distant on the "off" side; "cover point," to the right of "point" (as he is looking towards the batsman) and several yards deeper; "mid on" a few yards to the right of the bowler, and "mid off" in a corresponding position on his left, and so forth. Good captains at all times exercised judgment in modifying to some extent the arrangement of the field according to circumstances, but in this respect much was learnt from the Australians, who on their first visit to England in 1878 varied the positions of the field according to the idiosyncrasies of the batsmen and other exigencies to a degree not previously practised in England. The perfection of wicket-keeping displayed by the Australian, McCarthy Blackham (b. 1855), taught English cricketers that even modern grounds the "long stop" could be altogether dispensed with, and this position, which in former days was considered a necessary and important one, has since been practically abolished. In many matches at the present day, owing to the character of modern bowling, no more than a single fieldsmen is placed on the "on" side, while the number and positions of those "in the slips," i.e. behind the wicket on the "off" side, are subject to no sort of rule, but vary according to the nature of the bowling, the state of the ground, or any other circumstances that may influence the judgment of the captain of the fielding side. Charts such as were once common, showing the positions of the fielders for fast, slow and medium bowling respectively, would therefore to-day give no true idea of the actual practice; and much of the skill of modern captaincy is shown in placing the field.

The score is compiled by runs made by the batsman and by the addition of "extras," the latter consisting of "byes," "leg-byes," "wides" and "no-balls." All these are included in the designation "runs," of which the total score is composed, though neither "wides" nor "no-balls" involve any actual run on the part of the batsmen. They are called by the umpire on his own
439

CRICKET

initiative, in the one case if the bowler's delivery passes the batsman beyond the reach of his bat ("wide"), and in the other if he delivers the ball without having either foot touching the ground behind the "bowling crease" and within the "return crease," or if the ball be jerked or thrown instead of being bona fide "bowled." "Wides" and "no-balls" count as one "run" each, and all "extras" are added to the score of the side without being credited to any individual batsman. The batsman may, however, hit a "no-ball" and make runs off it, the runs so made being scored to the striker's credit instead of the "no-ball" being entered among the "extras." The batsman may be "run out" in attempting a run off a "no-ball," but cannot be put out off it in any other way. "Byes" are runs made off a ball which touches neither the bat nor the person of the batsman, "leg-byes" off a ball which, without touching the bat or hand, touches any other part of his person. With the exception of these "extras," the score consists entirely of runs made off the bat.

Batting is the most scientific feature of the game. Proficiency in it, as in golf and tennis, depends, in the first instance, to a great extent on the player assuming a correct attitude for making his stroke, the position of leg, shoulder and elbow being a matter of importance; and although a quick and accurate eye may occasionally be sufficient by itself to make a tolerably successful run-getter, good style can never be acquired, and to be consistent in batmanship is seldom to be gained, by a batsman who has neglected these rudiments. Good batting consists in a defence that is proof against all the bowler's craft, combined with the skill to seize every opportunity for making runs that the latter may inadvertently offer. If the batsman's whole task consisted in keeping the ball out of his wicket, the accomplishment of his art would be comparatively simple; it is the necessity for doing this while at the same time he must prevent the ball from rising off his bat into the air in the direction of any one of eleven skillfully placed fielders, each eager to catch him out, that offers scope for the science of a Grace, a MacLaren or a Trumper. In early days when the wickets were low and the ball was trundled along the ground, the curved bats of the old pictures were probably well adapted for hitting, defence being neglected; but when the height of the wickets was raised, and bowlers began to pitch the ball closer to the batsman so that it would reach the wicket on the first bound, defence of the wicket became more necessary and more difficult. Hence the modern straight-bladed bat was produced, and a more scientific method of batting became possible. Batting and bowling have been fact developed together; and a new form of attack requiring a new form of defence. One of the first principles a young batsman has to learn is to play with a "straight bat" when defending his wicket against straight balls. This means that the whole blade of the bat should be equally opposed to the line on which the ball is travelling towards him, in order that the ball, to whatever height it may bound from the ground, may meet the bat unless it rises altogether over the batsman's hands; the tendency of the untutored cricketer being on the contrary to hold the bat sloping outwards from the handle to the point, as the golf-player holds his "driver," so that the rise of the ball is apt to carry it clear of the blade. Standing then in a correct position and playing with a straight bat, the batsman's chief concern is to calculate accurately the "length" of the ball as soon as he sees it leave the bowler's hand. The "length" of the ball means the distance from the batsman at which it pitches, and "good length" is the first essential of the bowler's art. The distance that constitutes "good length" is not, however, to be defined by precise measurement; it depends on the condition of the ground, and on the reach of the batsman. A good length ball is one that matches too far from the batsman for him to reach out to meet it with the bat at the moment it touches the ground or immediately it begins to rise, in the manner known as "playing forward," and at the same time not far enough from him to enable him to wait till after it has reached the highest point in its bound before playing it with the bat, i.e. "playing back." When, owing to the good length of the ball, the batsman is unable to play it in either of these two ways, but is compelled to play at it in the middle of its rise from the ground, he is almost certain, if he does not miss it altogether, to send it up in the air with the danger of being caught out. If through miscalculation the batsman plays forward to a short-pitched ball, he will probably give a catch to the bowler or "mid off," if he plays back to a well-pitched-up ball, he will probably miss it and be bowled out. The bowler is therefore continually trying to pitch balls just too short for safe forward play, while the batsman defends his wicket by playing forward or back as his judgment directs so long as the bowling is straight and of approximately good length, and is ready the instant he receives a bad-length ball, or one safely wide of the wicket, to hit it along the ground clear of the fieldsmen so as to make as many runs as he and his partner can accomplish before the ball is returned to the wicket-keeper or the bowler. But even those balls off which runs are scored are not to be hit recklessly or without scientific method. A different stroke is brought into requisition according to the length of the ball and its distance wide of the wicket to the "off" or "on" as the case may be; and the greatest batsmen are those who with an almost impenetrable defence combine the greatest variety of strokes, which as occasion demands they can make with confidence and certainty. There are, however, comparatively few cricketers who do not excel in some single stroke, and the batmen have to learn the most of his runs by "cuts" past "point," or by wrist strokes behind the wicket, while others, like the famous Middlesex Etonian C. I. Thornton, and the Australian C. J. Bonnor, depend mainly on powerful "drives" into the deep field behind the bowler's wicket. Some again, though proficient in all-round play, develop exceptional skill in some one stroke which other first-class players seldom attempt. A good illustration is the "glance stroke" off the legs which K. S. Ranjitsinhji made with such ease and grace. All great cricketers in fact, while observing certain general principles, display some individuality of style, and a bowler who is familiar with a batsman's play is often aware of some idiosyncrasy of which he can take advantage in his attack.

Bowling is, indeed, scarcely less scientific than batting. It is not, however, so systematically taught to young amateurs, and it may be partly in consequence of this neglect that amateur bowling is exceedingly weak in England as compared with that of professionals. The evolution of the art of bowling, for it has been an evolution, is an interesting chapter in the history of cricket which can only be briefly outlined here. The term "the art of bowling" is a misnomer, since, after delivering the ball that is the ball must be bowled, not thrown or jerked. When bowling underhand along the ground was superseded by "length bowling," it was found that the ball might be caused, by jerking, to travel at a pace which on the rough grounds was considered dangerous; hence the law against jerking, which was administered practically by chalking the inside of the bowler's elbow; if a chalk mark was found on his side, the ball was not allowed as fair. The necessity of keeping the elbow away from the side led gradually to the extension of the arm horizontally and to round-arm bowling, the invention of which is usually attributed to John Wills (or Willes; b. 1777) of Kent and Sussex. Nyren, however, says "Tom Walker (about 1700) began the system of throwing instead of bowling now so much the fashion"; and, "The first I recollect seeing revive this fashion was Wills, a Sussex man," the date of the revival being 1807. Walker was no-balled. Beldham (1760-1862) says, "The law against jerking was owing to the frightful pace Tom Walker put on, and I believe that he afterwards tried something more like the modern throwing-bowling. Willes was the first to the kind of round-arm bowling. He only revived what was forgotten or new to the young folk." Curiously enough, Beldham also writes of the same Tom Walker that he was "the first looming slow bowler" he ever saw, and that he "did feel so ashamed of such baby bowling, but after all he did more than even David Harris himself." Round-arm bowling was long and vigorously opposed, especially in 1826 when three matches were arranged between England and Sussex, the Sussex bowlers being round-arm bowlers. When England had lost the first two matches, nine of the professionals refused
to take part in the third, “unless the Sussex bowlers bowl fair, that is, abstain from throwing.” Five of them did play and Sussex lost, but the new style of bowling had indicated its existence. In 1844 the M.C.C.’s revised law read, “The ball must be bowled, not thrown or jerked, and the hand must not be above the shoulder in delivery.” Round-arm bowling was therefore legal. In 1862, Willsker (1828-1885), the Kent bowler, was no-balled by the umpire (Lilleywhite) for raising his hand too high, amid a scene of excitement that almost equalled a tumult. Overhand bowling was legalized on the 10th of June 1864 after strenuous opposition. In early days much importance was attached to great pace, but the success of the slow lobbing bowling (pitched up underhand) led to its cultivation; in both styles some of the best performers delivered the ball with a curious high action, thrusting the ball, as it were, from close under the arm-pit. When the advantages of bias (or twist, or break) were first known is not closely recorded, but we read of one Lamborn who (about 1800) could make the ball break from leg so that “the Kent and Surrey men could not tell what made of that cursed twist of his.” Whatever the pace of bowling, accuracy was the essential point or, more correctly, the power of aiming fairly at the wicket; the direction so that the batsman is nearest at peace. If the bowler is a mere machine, the batsman soon becomes his master; but the question as to which of the two is supreme depends very largely on the condition of the turf, whether it be hard and true, soft and wet, hard and rough or soft and dry; the first pair of conditions favour the batsmen, the second pair the bowler.

The immense amount of labour and expense devoted to the preparation and care of cricket grounds has produced during the past quarter of a century a perfection of smoothness in the turf which has materially altered the character of the game. On the rough and fiery pitches of earlier days, on which a “long stop” was indispensable, the behaviour of the ball could not be reckoned upon by the batsman with any degree of confidence. The first ball of an “over” might be a “shooter,” never rising as much as an inch off the ground, the next might bound over his head, and the third pursue some equally eccentric course. But on the best grounds of to-day, subject to the well-understood changes due to weather, the bound of the ball is so regular and true that the batsman has no difficulty in getting to his wicket. The result has been that in fine weather, when wickets are true and fast, bowlers have become increasingly powerless to defeat the batsmen. In other words the defence has been strengthened out of proportion to the attack. Bowlers have consequently to a great extent abandoned all attempt to bowl the wicket down, aiming instead at effecting their purpose by bowling close to but clear of the wicket, with the design of getting the batsman to give catches. Many batsmen of the stubbornly defensive type, known in cricket slang as “stonewallers,” retaliated by leaving such balls alone together, or stopping them deliberately with the legs instead of the bat.

These tactics caused the game to become very slow; over after over was bowled without an attempt being made to score a run and without apparent prospect of getting a wicket. This not only injured the popularity of the game from the spectator’s point of view, but, in conjunction with the enormous scores that became common in dry seasons, made it so difficult to finish a match within the three days to which first-class matches in England are invariably limited, that nearly 70% of the total number of fixtures in some seasons were drawn. Cricketers of an older generation have complained that the cause of this is partly to be found in the amount of time wasted by contemporary cricketers. These critics see no reason why half of a summer’s day should be allowed to elapse before cricket begins, and they comment with some scorn on the interval for tea, and the fastidiousness with which play is frequently interrupted on account of imperfect light or for other unimperative reasons. Various suggestions have been made, including proposals for enlarging the wicket, for enabling the attack to hold its own against the increasing strength of the defence. But the M.C.C., the only recognized source of cricket legislation, has displayed a cautious but wise conservatism, due to the fact that its authority rests on no sanction more formal than that of prestige tacitly admitted by the cricketing world; and consequently no drastic changes have been made in the laws of the game, the only important amendments of recent years being that which now permits a side to close its innings voluntarily under certain conditions, and that which, in substitution for the former hard and fast rule for the “follow on,” has given an option in the matter to the side possessing the requisite lead on the first innings.

**Early Players.**—If the era of the present form of cricket can very properly be dated from the visit of the first Australian team to England in 1878, some enumeration must be made of a few of the cricketers who took part in first-class matches in the earlier portion of the 19th century. Among amateurs should be noted the two fast bowlers, Sir F. H. Bathurst (1807-1881; Eton, Hampshire), and Harvey Fellowes (b. 1826; Eton); the batsman N. Felix (1804-1876; Surrey and Kent), who was a master of “cutting” and one of the earliest to adopt batting gloves; the cricketing champion of his time Alfred Mynn (1821-1861; Kent); and the keen player F. F. Miller (1828-1875; Sussex). The three Marshams, Rev. C. D. Marsham (b. 1835), R. H. B. Marsham (b. 1833) and G. Marsham (b. 1840), all of Eton and Oxford, were as famous as the Studds in the ’eighties; and R. Hankey (1832-1886; Harrow and Oxford) was a great scorer. In the next generation one of the greatest bats of his own or any time was R. A. H. Mitchell (1843-1905; Eton, Oxford, Hants). A very attractive run-getter was C. F. Buller (b. 1846; Harrow, Middlesex); an all too brief career was that of C. J. Ottaway (1850-1878; Eton, Oxford, Kent and Middlesex); whilst A. Lubbock (b. 1845; Eton, Kent) was a sound bat, and D. Buchanan (1830-1900; Rugby and Cambridge) a destructive bowler, as was also A. Appleby (1843-1902; Lancashire).

Of the professionals, Fuller Pilch (1803-1879) and E. G. Wenman (1803-1897) were great bats; T. Box (1808-1876) the most skilful wicket-keeper of his time; W. Lilleywhite (1792-1854), one of the first round-arm bowlers, renowned for the accuracy of his pitch, and W. Clark (1798-1856) possessed wonderful variety of pace and pitch. It was the last-named who organized the All England Eleven, and he was not chosen to play in as many as seven international matches. The greatest leg-bowler in England, George Parr (1826-1861), the greatest leg-batter in England, had no professional rival until the advent of Richard Daft (1833-1900). J. Dean (1816-1891) was the finest long-stopper, Julius Caesar (1830-1878) a hard clean hitter, as was G. Anderson (1826-1892), and T. Lockyer (1826-1869) seems to have been the first prominent wicket-keeper who took balls wide on the leg-side. Of bowlers, E. Willsher (1828-1885) would seem to have been the most difficult, W. Martinell (1818-1897) being a very good medium-paced bowler, and J. Wisden (1826-1884) a very fast bowler short in his length. Four famous bowlers of a later date are George Freeman (1844-1895), J. Jackson (1833-1901), G. Tarrant (1838-1870) and G. Wootton (b. 1834). With them must be mentioned the great batsmen, T. Hayward (1835-1876) and R. Carpenter (1830-1901), as well as two other keen cricketers, H. H. Stephenson (1833-1896) and T. Hearne (1836-1906).

Since the first half of the 19th century the sort of cricket to engage public attention has very greatly changed, and the change has become emphasized since the exchange of visits between Australian and English teams has become an established feature of first-class cricket. First-class cricket has become more formal, more serious and more spectacular. The contest for the county championship has introduced an annual competition, closely followed by the public, between standing rivals familiar with each other’s play and record; an increased importance has become attached to “averages” and “records,” and it is felt by some that the purely sporting side of the game has been damaged by the change. Professionalism has increased, and it is an open secret that not a few players who appear before the public as amateurs derive an income under some pretext or other from the game. Cricket on the village green has in many parts of the country almost ceased to exist, while immense crowds congregate
to watch county matches in the great towns; but this must no doubt be in part attributed to the movement of population from the country districts; and some compensation is to be found in league cricket (see below), and in the numerous clubs for the employees of business firms and large shops, and for the members of social institutes of all kinds, which play matches in the suburbs of London and other cities. At an earlier period two great professional organizations, "The All England," formed in 1846, and "The United All England," toured the country, mainly for profit, playing local sides in which "given men," generally good professional players, figured. They did much good work in popularizing the game, and an annual match between the two at Lord's on Whit-Monday was once a great feature of the season; but the increase of county cricket led eventually to their disbandment.

At this period, and much later, the first-class matches of "M.C.C. and ground" (i.e. ground-staff, or professionals attached to the club) occupied a far greater amount of importance than is at present the case. In recent years over 150 minor matches of the utmost value in propagating the best interests of cricket are annually played by the leading club. League cricket has of late become exceedingly popular, especially in the North of England, a number of clubs—about twelve to sixteen—combining to form a "League" and playing home-and-home matches, each with each of the others in turn; points are scored according as each club wins, loses, or draws matches, the championship of the "League" being thus decided.

**England v. Counties Cricket.**—The first English inter-county match which is recorded was played on Richmond Green in 1730 between Surrey and Middlesex; but for very many years, though counties played counties, there was no systematic organization, matches often being played at odds or with "given" players, who had no county connexion with the side they represented. This was the natural outcome of the custom of playing for stakes. It was not till 1872 that any real effort was made to organize county cricket. In that year the M.C.C. took the initiative by offering a cup for competition between the counties, six of which were to be selected by the M.C.C., the matches to be played at Lord's, but the scheme fell through owing to the coolness of the counties themselves. It was only in 1890 that the counties were formally and officially classified, Notts (the county club dating from 1859), Lancashire (1864), Surrey (1845), Kent (1842), Middlesex (1864), Gloucestershire (1869), Yorkshire (1862), and Sussex (1830), being regarded as "first-class" as indeed had been the case from the time of their existence; and by degrees other counties were promoted to this class; Somerset, in 1893; Derbyshire, Essex, Leicestershire, Warwickshire in 1894; Hampshire in 1895; Worcestershire in 1899; Northamptonshire in 1901.

In 1887 the County Cricket Council had been formed, working with and not against the Marylebone Club, for the management of county cricket, but the council dissolved itself in 1890, and it was then arranged that the county secretaries and delegates should meet and discuss such matters, and request the M.C.C. to consider the result of their deliberations, and practically to act as patron and arbiter. In 1905 an Advisory Cricket Committee was formed "with the co-operation of the counties, with a view to improve the procedure in dealing with important matters arising out of the development of cricket, the effect of which will be" (the quotation is from the annual report of M.C.C. in 1905) "to bring the counties into closer touch with the M.C.C." Various methods have been tried as to the assignment of points or marks, the following being the list of champion counties up to 1900:

English county cricket is now the most firmly established cricketing institution in the world, but in its earlier stages it owed much in different counties to enthusiastic individuals and famous cricketing families whose energies were devoted to its encouragement and support. To Gloucestershire belongs the honour of the greatest name in the history of the game. Dr W. G. Grace (q.v.) was not only the most brilliant all-round cricketer in the world, but he remained supreme after reaching an age when most cricketers have long since abandoned the game. He and his two famous brothers, E. M. Grace (b. 1841) and G. F. Grace (1850-1880), rendered invaluable service to their county for many years; and not to their county alone, for the great part they played with or against the English in the first-class cricket dics that filled the growing popularity of the county fixtures. A separate article is devoted to Dr W. G. Grace, whose name as the champion of the game will always be associated with his county. And of Dr E. M. Grace it might be said that, besides being the "King of the field at 'point'" ever seen, he altogether took 11,092 wickets and scored 75,625 runs. In more recent years some excellent cricketers have been associated with Gloucestershire, such as F. Townsend, J. P. Howard, and J. H. Harvey, and as a consumer of his powers of hitting. What W. G. Grace did for Gloucestershire, Lord Harris (b. 1851) did for Kent, and his services are not to be estimated by his performances against any other county. His services were always exerted in upholding a spirit of sportsmanship and honourable distinction to the national game. Kent had been a home of cricket since the first half of the 18th century, but it was Lord Harris who made it a first-class county, celebrated for the number of distinguished amateurs who have taken part in its matches. The Hon. Ivo Bligh, afterwards Lord Darnley (b. 1859), and F. Marchant (b. 1864), both Etonians like Lord Harris himself, Harris's younger brother, H. Farrant (b. 1859) and M. C. Kemp (b. 1862), and the Wykehamist J. R. Mason (b. 1874) are names that show the place taken by public school men in the annals of Kent cricket, while the family of Hearne, who have the county with some famous names in amateur batmen like W. Rashleigh, C. J. Burnup, E. W. Dillon and A. P. Day have been prominent in the Kent eleven; and in Fielder and Blythe they have had two first-class professional bowlers. The Kent nursery at Tonbridge has produced a fine line of young players, and contributed not a little to the rising reputation of Kent, which justified itself when the county won the championship in 1906, largely owing to the admirable batting of the amateur K. L. Hutchings.

Middlesex and Lancashire, who have been indebted to the great public schools, and especially to Harrow, which provided both counties with famous captains who directed their fortunes for an uninterrupted period of over twenty years. In 1887, the most celebrated of their legendary brothers, all Harrovians, who founded the Middlesex County Club, hounded on the captaincy, after a personal record of astonishing brilliancy, to a younger Harrow and Oxford cricketer, A. N. Hornby, who was one of the finest all-rounders of his time, one of the safest out-fielders of his day, and a captain of consummate judgment and knowledge of the game. A. N. Hornby, a contemporary at Harrow of J. D. Walker, was for many years the soul of Lancashire cricket, and he succeeded in the captaincy of his county by the still more famous Harrovian, A. C. MacLaren, one of the greatest batsmen in the history of cricket, whose record for England in test matches against Australia was almost unrivalled. In 1905, when he headed the batting averages, MacLaren made the highest individual score in a first-class match, viz. 424 against Somersetshire. Middlesex has also the distinction of having produced the two greatest amateur wicket-keepers in the history of English cricket, namely, the Hon. Alfred Lyttelton (b. 1857) and Gregor MacGregor, both of whom, after playing for Cambridge University, gave their services to the Metropolitan county; while Lancashire can boast of the greatest professional wicket-keeper in Richard Pilling (1855-1891), whose reputation has not been eclipsed by that of the most proficient of more recent and Lancashire famous cricketers, a contemporary of Lyttelton, who was invaluable to Lancashire for
Some years when he was one of the very finest all-round cricketers in the country, was A. G. Steel (b. 1858), equally brilliant as a batsman and as a slow bowler; and other names memorable in Lancashire cricket were R. G. Barlow (b. 1859), whose stubborn batting was a feature of the 1890s, and J. W. Hall, the right-handed opening batsman of great efficiency whose long partnership with J. A. Hobbs was a landmark in the history of Lancashire cricket.

Several of the celebrated cricketers of early times already mentioned as having played for the Surrey club were more closely associated with the adjoining county of Sussex, whose records go back as far as 1734, in which year a match was played with the county of Kent. Note, however, that the duke and Sir William Gage. One of the earliest famous cricketers, Richard Newland (d. 1791), was a Sussex man; and James Broadbridge, W. Lambert, Tom Box, and the great Lillywhites; amateur batting averages in 1845, was still performing in five-wicket white box (1858–1860) kept cricket for the county for twenty-four years without missing a match. Notwithstanding this distinguished history, Sussex never attained the highest place in the county rivalry, and for a number of years towards the end of the season, before which time the Asiatic work of the Asiatic, C. B. Fry (b. 1872), who came from Oxford University to become a fast bowler, and Cobham (b. 1872), a dashing batsman, who in 1896 succeeded to the position of being the county cricketer for the best known. The present writer's father, C. E. Shuter (b. 1829), both as captain and as batsman, did splendid work; and J. T. Bosanquet, besides assisting powerfully with the bat, became famous for inaugurating a new style of curving bowling ("shuttle"").

A glance at the table given above shows the high place occupied by Surrey in the past. Surrey county cricket can be traced as far back as 1730. Pycroft observes that "the name of Surrey is mentioned as early as 1712, and the first county cricket from 1817 to 1824." But before that date two of the most celebrated cricketers, William Lillywhites and Fuller Phile, had occasionally played for the county, and so also had J. W. Hall, 1870–1893), W. Lambert (1779–1851). Pennington, the Studd (b. 1835), both as captain and as batsman, did splendid work; and J. T. Bosanquet, besides assisting powerfully with the bat, became famous for inaugurating a new style of curving bowling ("shuttle").

The following years his reputation was fully maintained, and in 1896 he had a particularly successful season.

Shuter's and Hearne's records came at a time when the great names in the history of the game. Richard Daft (1835–1900), after playing as an amateur, became a professional in preference to abandoning the game, scoring to resort to any of the pretenses by which he may have been led, and in some measure wages were fairly paid their services while continuing to cling to the status of the amateur. William Oscoff (1843–1905) was one of Yorkshire's early batting heroes, and in Alfred Shaw (b. 1842) and A. Mowrey (1825–1845), he headed the batting averages in 1828, and was a remarkably steady bowler who bowled an abnormal number of maiden overs; Mordecai Sherwin (b. 1851), an excellent successor to T. Plumb (b. 1833) and F. Wild (1847–1893) as wicket-keeper, and in L. Knott (b. 1877) and John Gunn, both of whom proved themselves cricketers worthy of the Notts traditions. J. A. Dixon (b. 1861), one of the few amateurs of the Nottinghamshire records, was for some time the acknowledged captain of the county side. But it was a dashing batsman, who in 1899 was entertaining a Melbourne club when the pair scored 391 in the first wicket in a match against Gloucestershire.

The county cricket of Yorkshire is modern in comparison with that of Surrey, Sussex or Kent. The county club only dates from 1861, and for some years the team was composed entirely of professionals. But though Yorkshire attained the championship three times during the first ten years of the county, the team was much inferior to that of the other county. The county did not in the opening years of the 20th century maintain the high place it occupied during the last quarter of the 19th. It possessed some excellent professionals, however, in Hayes, Hobbs and Lees, as one united club county is quite lost in the history of Lord Dalmeny, showed a revival, a new fast bowler being found in N. A. Knox, and a fine batsman and bowler in J. N. Crawford.
CRICKET

Bates (1855-1900), too, was effective both as batsman and bowler; and Tom Emmett (1841-1904), long proverbial for bowling "a wide and a wicket," was deservedly popular. To the earlier period belonged two fast bowlers, George Freeman (1844-1895) and Allan Hill (b. 1845), and the eminent wicket-keeper Pincher (1841-1903), who was succeeded by J. Hunter (1857-1901), and later by his brother Daniel Hunter (b. 1862). The full effect of Lord Hawke's energetic captness was seen in 1900, when Yorkshire played through a prolonged series of outstanding matches. The county's record was but little inferior in both the following years and again in 1905, in each of which years it retained the championship.

It was during this period that as notable a group of cricketers were the Yorkshire colours as ever appeared in county matches. William H. Hill (1855-1900), one of the finest all-round cricketers the game has ever known, was an unlimb bowler, and Yorkshire was fortunate in discovering a successor of even superior skill in Wilfrid Rhodes, who in 1900 took over 200 wickets at a cost of 12 runs each in county matches alone, and was also an excellent bat. Hirst and Jackson were the two great fast bowlers. Hirst was born in Windlesham (Surrey), S. Jackson (b. 1870), like his fellow-Harrovian A. C. MacLaren, had a wonderful record in test matches against Australia; he captained the England eleven in 1905, and his wonderful nerve enabled him to extricate his team from the difficult position in which they found themselves at the close of the first innings. In 1906 he scored the famous "benefit" match (Yorkshire against Lancashire) in August.

Besides cricketers like these, such fine players were included in the team as Wainwright (b. 1865), Haigh (b. 1871), Denton (b. 1874), and Longbottom (b. 1866); with such a formidable batting line-up Yorkshire had no "tail," and was able to win the championship six times in a decade.

Somersetshire hardly fulfilled the promise held out by the success achieved in the years 1855 and 1854. The greatest individual performance of the season was probably that of the Hampshire cricketer W. G. Grace, who, when the county first-class teams came together at Lord's, expressed sovereignly to the captain charming of six counties 180 runs, the best wicket-keeper of his day, who represented England against Australia in the test matches; while Worcestershire produced one of the best all-round professionals in the country for a number of years in Arnold (b. 1877) and a batsman of about equal brilliancy in R. E. Foster, a member of a cricketing family to whom belongs the credit of raising Worcestershire into a cricketing county of the first class. Derbyshire, similarly, can claim some well-known cricketers, among them the bowler W. M. Grace (1841-1894), W. Chatterton (b. 1867) and W. S. Sowerby (b. 1868), a first-class wicket-keeper. Essex possesses at Leyton one of the best county grounds in the country, and the club was helped over financial difficulties by the munificent support of an old Uppingham and Cambridge cricketer, C. E. Green. It has a very small ground, but when Lord's was built it had a fine pitch and a good bowling square of wicket, and its annals are conspicuous for the phenomenal scores made during the single season of 1899 by Major R. M. Poore; these two put together 411 against Somersetshire in that year before being separated. Among the later Hants professionals, Llewellyn was most prominent.

The distribution of cricketing ability in England may be the subject of some interesting speculation. In the forty years of the period from 1850 to 1890 there were no less than seventeen matches in which the total score of either side was over 500 runs; in 1900 they only won by two wickets, but to do so had to make, and did make, 501 runs in the last innings of the match. In 1903 the gentlemen, heavily in arrears after each side had played an innings, were reduced to playing a fifth of a wicket against their opponents, who won by only 27 runs. In 1888 the gentlemen won by only 5 runs; in 1890 Club, the 1903 professionals won by 13. The gentlemen won only 7 matches as compared with 21 losses. In 1867 they turned theVec, for the gentlemen Grace, especially W. G. Grace, became a power in the cricket-field, and from 1867 to 1884 the gentlemen, winning fifteen matches, lost only 10. From 1885 the gentlemen won fourteen matches, and by 1903 the professionals had won eleven matches and lost but four. The gentlemen won on nine successive occasions between 1874 and 1884, a draw intervening; while beginning with 1884 the gentlemen's won eleven matches in 1885 the gentlemen only won 7 matches as compared with 21 losses. In 1867 they turned the, for the gentlemen Grace, especially W. G. Grace, became a power in the cricket-field, and from 1867 to 1884 the gentlemen, winning fifteen matches, lost only 10. From 1885 the gentlemen won fourteen matches, and by 1903 the professionals had won eleven matches and lost but four. The gentlemen won on nine successive occasions between 1874 and 1884, a draw intervening; while beginning with 1884 the gentlemen's won eleven matches in 1885 the gentlemen only won 7 matches as compared with 21 losses. In 1867 they turned the, for the gentlemen Grace, especially W. G. Grace, became a power in the cricket-field, and from 1867 to 1884 the gentlemen, winning fifteen matches, lost only 10. From 1885 the gentlemen won fourteen matches, and by 1903 the professionals had won eleven matches and lost but four. CRICKET

 till 1880. As at Lord's, it was the era of Grace, but from this point the amateurs could only win two matches, and by the narrowest of margins, till 1903, this making their sum of victories up to then, as opposed to twenty-three. In 1879 the gentlemen won in their triple match at Lord's, but the outcome of that match did not put the runs between the bowlers of the other side and the score was being inflected on the other. The highest individual score was Robert Abel's 247, and the next Dr W. G. Grace's 215. Hayward scored 203 in 1904; A. G. Steel and A. H. Evans bowled unchanged in 1827.

School and Club Cricket.—Cricket is the standing summer game at every English private and public school, where it is taught as carefully and systematically as either classics or mathematics. There are a good many local or private clubs, both Senior and Junior, that are independent of any club; but Dr Grace was instrumental in the formation of the London county club, whose ground was at the Crystal Palace at Sydenham. Other amateur clubs, similar to I Zingari, are the Free Foresters, Hambledon, Wykehamists, the Etonians (in the prelude the Etonians, Ramblers, Harrow Wanderers, Old Wykehamists, and others clubs whose membership is restricted to "old boys.”

The Oxford and Cambridge universities match was first played in 1827, but was not an annual fixture till 1836. Five matches, the last of 1829, 1833, 1836, 1848 and 1850, were played at Oxford, the rest at Lord's. The "Varsity match," and that between the two great public schools, Eton and Harrow, are great "society" events at Lord's; the former being held every five or ten years, and the latter, 1850, 1905, and 1910. In 1853, 1854 and 1855, T. B. Harrow on thirty-five occasions. D. C. Boles by scoring 185 in 1904 set up a new record for this match, beating the 152 obtained in 1847 by Emilias Bayley (afterwards the Rev. Sir John Robert Lock), and the 135 by T. B. Harrow in 1854. Further record by scoring over a hundred runs in each innings. Of the contests between Oxford and Cambridge, the latter (up to 1900) had lost thirty-one and won thirty-five. Oxford's 503 in 1900 and Cambridge's 492 in the same match furnished the highest aggregates. The largest individual innings was 172 not out by J. F. Marsh in 1901; but as a feat of batting it was intrinsically inferior to the 179 by R. E. Foster in 1909. Of the thirty-five centuries scored up to 1909, Oxford and Cambridge have respectively scored 16 and 19. S. A. Sharpe and J. E. Bannerman both scored a hundred both in the Eton v. Harrow and Oxford v. Cambridge matches. In the match of 1870 F. C. Cobden (b. 1849) took the last three Oxford wickets with consecutive balls, winning the match for Cambridge.

Australian Cricket.—Naturally popular in a British colony, cricket made but little progress in Australia until after the arrival of an English professional eleven in 1861-1862, which carried all before it. Since 1857, F. J. Bowmer (b. 1855), and S. P. Jones (b. 1861), whilst the wicket-keeper was McCarthy Blackburn (b. 1855). This visiting side in 1882 was the greatest team of all; 23 matches were won, only 4 lost, and England was defeated at the Oval by 7. In 1884, English cricket had improved, and the visiting record was hardly so good. The match against England at the Oval will not soon be forgotten. The Colonials scored 551 (Murdoch 211, McDonnell 103, Scott 102), and England responded with 346, Scotton and W. J. Bannerman. The team of H. J. H. Scott (b. 1858) in 1886 proved less successful, for all three test matches were lost, and eight defeats had to be set against nine victories, but Giffen covered himself with distinction. In 1887, the first Australian team was sent to England, and McDonnell's team in 1888 marked the appearance of the bowlers C. T. B. Turner (b. 1862) and J. Ferris (1867-1900). The former took 314 wickets for 11 runs each, and the latter 220 for 14 apiece. In 1890, the New South Wales and Victoria teams met, and the former won, and set 392, and the latter, with the wickets of Blackham and W. E. M. Blackburn, made a total of 185. The New South Wales team made 99. Claremont 100, and Bannerman made a century. The team of H. J. H. Scott (b. 1858) in 1890, though they did not win the number of test matches, the colonials were most successful, 19 matches being victories and only 6 lost. S. E. Gregory, J. Darling (b. 1870), F. A. Irelan (b. 1867), A. C. Hirst (b. 1869-1905) were the best bowlers. Claremont made an admission, H. Trumble (1867) kept an excellent length, and E. Jones (1869) was deadly with his fast bowling.

The Australian representatives in 1899 demonstrated that they were not inferior to the Englishmen in the matter of successes and only 3 defeats (s. Essex, Surrey and Kent) being emphasized by a victory over England at Lord's by 10 wickets, the only one of the five test matches brought to a conclusion. M. A. Noble (b. 1873) and Victor Trumper (b. 1877), both of whom made centuries, were the chief cricketers of the series. Noble made the largest individual score hitherto made by an Australian in England, the previous best having been 286 by Murdoch in the corresponding match in 1882. Trumble scored 118 runs and took 142 wickets for the season. The performance of Trumper in making 2570 runs (with an average of 48) surpassed anything previously seen; R. A. Duff (b. 1878) also proved a brilliant run-getter. W. W. Armstrong (b. 1879) was useful in all departments, and J. V. Saunders (b. 1879) and D. L. 'Jackson (b. 1882) were useful bowlers. In 1902 another fine Australian eleven, captained by Darling, won 23 and lost only 2 matches. They won the rubber of test matches at Manchester by 3 runs, but lost the final at the Oval by an innings. Darling became the first Australian to score 1000 runs in a season. In 1905 there was a marked falling-off, as England won two and drew the other three test matches; but only one other defeat, by Essex by 19 runs, had to be set against 16 Australian victories. The performance of Trumper in having scored 1733 runs with an average of 106 in the earlier part of the tour, was becoming less formidable. Duff saved the colonials by a great innings in the fifth test match; Trumper was less certain than formerly, and Clement Hill more reckless; whilst J. J. Kelly (b. 1867) on his fifth tour was better than formerly when he arrived in England.

The Australians who visited England under the leadership of M. A. Noble in 1909 were generally held to be a weaker team than most of their predecessors, but they greatly improved as the season advanced. H. A. D. MacLaren, who was captain, took the place of H. J. H. Scott, and made the highest merit, and as a captain Noble has seldom been surpassed in consummate generalship. Their record of thirteen wins to four defeats offered little evidence of inferiority, while the large number of draws was no sign of a lack of determination. The batting was not always good, and the weather that largely prevailed throughout the summer. Two out of the five test matches were unfinished, and Australia won the rubber by two matches to one. In all the test matches England was under very little pressure, and in none did the visitors appear to be longer the batmen had he been some years earlier; Jackson had abandoned first-class cricket; Hirst and Hayward were becoming veterans; and, speaking generally, the English batting was decidedly inferior, and it collapsed feebly in three of the test matches. England's failure, for which poor fielding and missed catches were also responsible, was the more disappointing since they began well by winning the first test match at Birmingham by ten wickets.
C. B. Fry and Hobbs knocking off the 105 runs required to win in the second innings without the loss of a wicket. In the third test match, at Leeds, England, was deprived of the services of Hayward and Blythe through illness, and an accident to Jessop during the match compelled the side to play a man short. It was in bowling that the Australians were thought to be least strong; but Laver's analysis in the Manchester test match, when he took 8 wickets for 31 runs in England's first innings, was the most notable feature of the match; and although his record at the head of the bowling averages for the tour, 70 wickets at an average cost of 14 runs each, he had usually been in trouble. In the Melbourne test match, which terminated in a draw after five days, neither team was able to assert its superiority, and England took the series by the narrowest margin, Australia's win being 11 runs. A further and interesting feature of the encounter was the bowling out of twenty-one players in the side by the bowler F. Morley. Four victories could be set against three defeats; Australia winning the only test match, owing to the batting of Blackham. Shaw's second tour in 1884 showed Barnes to have reached his first-class form, and by bowling 10 wickets for 47 each in the first innings of the tour of 1884, and 25 in the second innings of the match at Adelaide, his leg-spinning on the one hand and his off-spin on the other, he was able to destroy the English innings. The third tour, in 1885, saw the first and second matches won by England, and the third by Australia, the victory of the former being the result of thirty runs in the second innings. In the test match, Australia was defeated by 72 runs. The batting of Blackham and Bannister in the Melbourne test match was of the highest standard, and G. O. Wood showed his ability as an all-rounder in the same match. In the last test match, which was won by England, Shaw and Lightbody's batting was equalled only by the bowling of F. C. Clay and W. J. Peel. England was defeated by 44 runs. A fourth tour was played in 1886, the match at Sydney being won by Australia by 133 runs in the second innings, the English batting of W. G. Grace and H. S. Croft being equalled only by the bowling of W. E. Bradman. Australia's victory in the last test match, which was won by England, was due to the batting of Bannister and the bowling of W. G. Grace.

The following table shows the Australians who headed the batting and bowling averages respectively in tours in England up to 1909.

The first English team to visit Australia was organized in 1862, and was captained by H. H. Stephenson. George Parr (1864-1881) took over the captaincy in 1864. Dr. E. M. Grace being the only amateur. In 1873 the Melbourne Club invited Dr. W. G. Grace to take out an eleven, and three years later James Lillywhistle contracted a team of professionals. On this tour for the first time colonials contended on equal terms, one match v. Australia being won by 4 wickets and the other lost by 45 runs. Lord Harris in the autumn of 1876 took a complete side to play a man short. It was in bowling that the Australians were thought to be least strong; but Laver's analysis in the Manchester test match, when he took 8 wickets for 31 runs in England's first innings, was the most notable feature of the match; and although his record at the head of the bowling averages for the tour, 70 wickets at an average cost of 14 runs each, he had usually been in trouble. In the Melbourne test match, which terminated in a draw after five days, neither team was able to assert its superiority, and England took the series by the narrowest margin, Australia's win being 11 runs. A further and interesting feature of the encounter was the bowling out of twenty-one players in the side by the bowler F. Morley. Shaw's second tour in 1884 showed Barnes to have reached his first-class form, and by bowling 10 wickets for 47 each in the first innings of the tour of 1884, and 25 in the second innings of the match at Adelaide, his leg-spinning on the one hand and his off-spin on the other, he was able to destroy the English innings. The third tour, in 1885, saw the first and second matches won by England, and the third by Australia, the victory of the former being the result of thirty runs in the second innings. In the test match, Australia was defeated by 72 runs. The batting of Blackham and Bannister in the Melbourne test match was of the highest standard, and G. O. Wood showed his ability as an all-rounder in the same match. In the last test match, which was won by England, Shaw and Lightbody's batting was equalled only by the bowling of W. E. Bradman. Australia's victory in the last test match, which was won by England, was due to the batting of Bannister and the bowling of W. G. Grace.
tean under Mr Leveson Gower went to South Africa, and played test matches.

West Indies.—West Indian cricketers toured in England in 1900, winning 3 matches and losing 6. The best batsman was C. A. Oliver (b. 1870). In 1876 they subsequently qualified under the leadership of the renowned bowlers on S. Woods and T. Burton (b. 1872). In 1877 teams under Lord Hawke and A. Priestly (b. 1876) both visited West Indies, winning 2 matches and losing 2. R. S. Liddle and M. H. Shaw, who both played in 1876, established a new record in 1869, and the West Indies made 133 runs. B. J. T. Bosanquet, E. R. Wilson (b. 1879) and E. M. Dowson (b. 1880) were the chief performers. In 1906 another West Indian side visited England, but were not particularly successful.

in the United States of baseball, and in Canada with the rival attractions of lacrosse. Nevertheless it has grown in popularity. Philadelphia being the headquarters of the game in the New World.

New York matches are arranged by the Metropolitan District Cricket and Football Club. The city is divided into five districts, the organizations are the Northwestern, the California and the Massachusetts associations, while the Intercollegiate Cricket League consists of college teams representing Harvard, Pennsylvania and Yale. The matches are played annually for the Halifax Cup, and the game is controlled by the Associated Cricket clubs of Philadelphia.

Bibliography.—The chief works on cricket are, apart from well-known annuals—H. Bentley's Scores from 1762 to 1862 (published in 1823) and John Noyes' Victorian Cricketers' Turn (1853). N. Wano- strocht's Felix at the Bat (various editions, 1845-1855); F. Lill- whyte's Cricket Scores and Biographies, 1740 to 1860 (1860); J. Pycroft's Cricket Field (various editions, 1862-1873); C. B. Fry's History of the Middlesex Cricket Club, 1871, new ed. (1896); Marylebone Cricket Club Scores and Biographies (1876), a continuation of Lillwhyte's Scores and Biographies; C. B. Fry's English Game of Cricket (1877); History of S. D. 'The Hundred Centuries', by W. E. Davies; History of the Middlesex Cricket Club, by W. J. Ford (1900); History of the Cambridge University Cricket Club, by W. J. Ford (1901); History of the Yorkshire County Cricket Club, by R. S. Holmes (1904); Reports of the Annual General Meetings of the Lord's Cricket Ground, by A. D. Taylor (1903); Curiosities of Cricket, by F. S. Ashley Cooper (1901); ("Crick," by Lord Hawke, in English Sport, by A. E. T. Watson (1903); Cricket, edited by H. G. Hutchinson (Badminton Library), by A. G. Steel and Hon. R. L. Lyttleton (1904); Old English Cricketers, by Old Ebor (1903); Cricket in Many Climes, by P. F. Warner (1903); How We Recovered the Ashes, by P. F. Warner (1904); England Australia, by J. N. Pentelow (1857-1904); The Jubilee Book of Cricket, by R. K. Ranjitsinhji (1897).
CRICKHOWELL—CRIME

CRICKHOWELL, a market town of Brecknockshire, Wales, 14 m. E. of Brecon, beautifully situated on the left bank of the Usk, which divides it from Llangattock. Pop. (1901) 1,140. The nearest railway stations are Govilon (5 m.) and Gilwern (4 m.) on the London & North-Western railway, but a mail and passenger motor service running between Abergavenny and Brecon passes through the town. It is also served by the Brecon & Newport Canal, which passes through Llangattock about a mile distant. Agriculture is almost the sole industry of the district. The town derives its name from a British fortress, Crug Hywel, commonly called Table Mountain, about 2 m. N.E. of the town. Crickhowell Castle, of which only a tower remains, probably dated from the Norman conquest of the country. The manor of Crickhowell used to be regarded as a borough by prescription, but there is no record of its ever having possessed any municipal institutions. The church is in transitional Decorated style.

CRICKLADE, a market town in the Cricklade parliamentary division of Wiltsire, England, 9 m. N.W. of Swindon, on the Midland & South-Western Junction railway. Pop. (1901) 1,517. It is pleasantly situated in the plain which borders the southern slopes of the Cotswolds, but not, whether from the Thames and Severn Canal. The cruciform church of St Sampson is mainly Perpendicular, with a fine ornate tower, and an old rood-stone in its churchyard. The small church of St Mary has an Early English tower, Perpendicular aisles and a Norman chancel-arch. There is some agricultural trade.

Legend makes Cricklade the abode of a school of Greek philosophers before the Roman conquest, and the name is given as "Greeklake" in Drayton's Polyolbion. It owed its importance in Saxon times to its position at the passage of the Thames. During the revival of Æthelwold the Ætheling in 905 he and his army "harried all the Mercian's land until they came to Cricklade and there they went over the Thames" (Anglo-Sax. Chron. sub anno), and in 1016 Canute came with his army over the Thames into Mercia at Cricklade (ibid.). There was a mint at Cricklade in the time of Edward the Confessor and William I., and William of Dover fortified a castle here in the reign of Stephen. In the reign of Henry III. a hospital dedicated to St John the Baptist was founded at Cricklade, and placed under the government of a warden or prior. Cricklade was a borough by prescription at least as early as the Domesday Survey, and returned two members to parliament from 1295 until disfranchised by the Redistribution Act of 1885. The borough was never incorporated, but certain liberties, including exemption from toll and passage, were granted to the townsmen by Henry III. and confirmed by successive sovereigns. In 1257 Baldwin de Insula obtained a grant of a Thursday market, and an annual three days' fair at the feast of St Peter ad Vincula. The market was subsequently changed to Saturday, and was much frequented by dealers in corn and cattle, but is now inconsiderable. During the 14th century Cricklade formed part of the dowry of the queens of England. In the reign of Henry VI. the lordship was acquired by the Hungerford family, and in 1427 Sir Walter Hungerford granted the reversion of the manor to the dean and chapter of Salisbury cathedral to aid towards the repair of their buildings.

CRIEFF, a police burgh of Perthshire, Scotland, capital of Strathearn, 17½ m. W. of Perth by the Caledonian railway. Pop. (1901) 5,808. Occupying the southern slopes of a hill on the left bank of the Earn, here crossed by a bridge, it practically consists of a main street, with narrower streets branching off at right angles. Its climate is the healthiest in mid-Scotland, the air being pure and dry. Its charter is said to date from 1218, and it was the seat of the courts of the earls of Strathearn till 1747, when heritable jurisdictions were abolished. A Runic sculptured stone, believed to be of the 8th century, and the old town cross stand in High Street, but the great cattle fair, for which Crieff was once famous, was removed to Falkirk in 1770. It was probably in connexion with this market that the "kind gallowes of Crieff" acquired their notoriety, for they were mostly used for the execution of Highland cattle-stealers. The principal buildings are the town hall, tolbooth, public library, assembly rooms, mechanics' institute, Morison's academy (founded in 1839), and Strathearn House, a hydrophatic establishment built on an eminence at the back of the town, and itself sheltered by the Knock of Crieff (911 ft. high). The industries consist of manufactures of cotton, linen, woollens and worsteds, and leather. Drummond Castle, about 3 m. S., is celebrated for its gardens. They cover an area of 10 acres, are laid out in terraces, and illustrate Italian, Dutch and French styles. They were planned by the 2nd earl of Perth (d. 1662), and take rank with the most magnificent in the United Kingdom. The keep of the castle dates from 1490, and much of the original building was demolished in 1689, a few years after its siege by Cromwell. The present structure was erected subsequent to the extinction of the Jacobite rebellion.

CRIME (Lat. crimen, accusation), the general term for offences against the Criminal Law (q.v.). Crime has been defined as "a failure or refusal to live up to the standard of conduct deemed binding by the rest of the community." Sir James Stephen describes it as "some act or omission in respect of which legal punishment may be inflicted on the person who is shown to have committed the act either through his fault whether voluntary or involuntary act." Such action or neglect of action may be injurious or hurtful to society. It is a wrong or tort, to be prevented and corrected by the strong arm of the law.

Crimes vary in character with times and countries. Under different circumstances of place and custom, that which at one time is denounced as a crime, at another passes as a meritorious act. It was once an imperative duty for the family to avenge the death of a kinsman, and the blood feud had a sanction that made killing no murder. Again, among primitive tribes to make away with parents at an advanced age or suffering from an incurable disease was a filial duty. Polyandry was sometimes encouraged, and cannibalism practised with general approval; religious sentiment elevated into heinous crimes, blasphemy, heresy, sacrilege, sorcery and even science when it ran counter to accepted dogmas of the church. Offences multiplied when people gathered into communities and the rights of property and of personal security were understood and established. The law of the strongest might still interfere with individual ownership; crime was the worst and most absolute, whether exercised by one master or by the combined power of a company, was resisted, and this resistance constituted crime. As civilization spread and the bulk of the population settled into orderliness, society, for its own comfort, convenience and protection, would not tolerate the infracction of its rules, and rising against all lawbreakers decreed reprisals against them as the common enemy. Then began that constant warfare between criminals and the forces of law and order which has been continuously waged through the centuries with varying degrees of bitterness.

The combat with crime was long waged with great cruelty. Extreme penalties were thought to constitute the best deterrent, and the principle of vengeance chiefly inspired the penal law. The harshness of ancient codes makes a more humane age shudder. It was the custom to hang or decapitate, or otherwise take life in some more or less barbarous fashion, on the smallest excuse. The final act was preceded by hideous torture. It was performed with the utmost barbarity. Victims were put to death by breaking on the wheel, burning at the stake, by disembowelling and flaying or boiling alive. These were the aggravations of the original idea of riddance, the check was crime by the absolute removal of the offender. Only slowly and gradually milder methods came into force. Revenge and retaliation were no longer the chief aims, the law had a larger mission than to coerce the criminal and force him by severity to mend his ways. To withdraw him for a lengthened period from the sphere of his baseful activity was something; to subject him to more or less irksome processes, to solitary confinement upon short diet, deprived of all the solaces of life, with severe labour, were sharp lessons limited in effect to those actually subjected to them, but too remote to deter the outside crowd of potential wrongdoers. The higher duty of the administrator...
is to utilize the period of detention by labouring to reform the
criminal subjects and send them out from gaol reformed
characters. If no very remarkable success has been achieved
in this direction, it is obviously the right aim, and it is being more
and more steadfastly pursued. But it is generally accepted
in principle that to eradicate criminal proclivities and cut off
recruits from the permanent army of crime the work must be
undertaken when the subject is of an age susceptible of
reform; hence the extreme value attaching to the more
enlightened treatment of crime in embryo, a principle becom-
ing more and more largely accepted in practice among civilized
nations.

It may safely be asserted that the germ of crime is universally
present in mankind, ever ready to show under conditions favour-
able to its growth. Children show criminal tendencies in their
earliest years. They exhibit evil traits, anger, resentment,
mendacity; they are often intensely selfish, are strongly acquisi-
tive, greedy of gain, ready to steal and secrete things at the first
opportunity. Happily the fatal consequences that would other-
wise be inevitable are checked by the gradual growth of inhibitory
processes, such as prudence, reflection, sense of morality, and
in many cases the influence of temptation. From this Dr
Nicholson deduces that "in proportion as this development is
prevented or stilled, either owing to an original brain defect or
by lack of proper education or training, so there is the risk of
the individual lapsing into criminal-mindedness or into actual
crime." In the lowest strata of society this risk is largely
increased from the conditions of life. The growth of criminals
is greatly stimulated where people are badly fed, morally and
physically unhealthy, infected with any forms of disease and
vice. In such circumstances, moreover, there is too often the
evil influence of heredity and example. The offspring of criminals
are constantly compelled to follow in their parents' footsteps by
the secret springs of nature and pressure of childish imitiveness.
The seed is thrown, so to speak, into a hot-bed where it finds
congenial soil in which to take root and flourish.

Wherever crime shows itself it follows certain well-defined lines
and has its genesis in three dominant mental processes, the result
of marked propensities. These are malice, acquisitiveness and
lust. Malicious crimes may be amplified into offences against
the person originating in hatred, resentment, violent temper,
and rising from mere assaults into manslaughter and murder.
Crimes of greed and acquisitiveness cover the whole range of
thefts, frauds and misappropriation; of larcenies of all sorts;
obtaining by false pretences; receiving stolen goods; robberies;
house-breaking, burglary, forgery and coinage. Crimes of lust
embrace the whole range of illicit sexual relations, the result of
ungovernable passion and criminal depravity. The proportions
in which these three categories are manifested have been worked
out in England and Wales to give the following figures.

The percentage in any 100,000 of the population is:

- Crimes of malice: 15%
- Crimes of greed: 10%
- Crimes of lust: 5%

The members of these categories do not form distinct classes;
their crimes are interdependent and constantly overlap. Crime
in many is progressive and passes through all the stages from
misappropriation to the worst crimes. Murder—the culminating
point of malice—is constantly preceded by petty larceny; theft
by forcible entry; and robbery is associated with violence and
armed resistance to capture. Criminality rising into its highest
development shows itself under many forms. It is instinctive,
passionate, accidental, deliberate and habitual, the outcome
of abnormal appetite, of weak and disordered moral sense.
The causation of crime varies, but a predominating motive is
idleness, leading to the predatory instincts of gain easily
acquired without the labour of continuous effort. To deprive
the more industrious or more happily placed of their hard-won
earnings or possessions, inspires the bulk of modern serious
crime. It no doubt has produced one peculiar feature in modern
crime: the extensive scale on which it is carried out. The
greatest frauds are now commonly perpetrated; great robberies
are planned in one capital and executed in another. The whole
is worked by wide associations of cosmopolitan criminals.

Other features of modern crime are especially interesting. It
is extraordinarily precocious. Children of quite tender years
commit murders, and boys and girls are frequently to be met
with as professional thieves. Again, the comparative propor-
tions of crime in the two sexes may be considered. Everywhere
women are less criminal than men. Naturally they have fewer
facilities for committing crimes of violence, although they have
offices peculiar to their sex, such as infanticide, and are more
frequently guilty of poisoning than men by 70% against 30%.
Statistics presented to the Prison Congress at Stockholm fix
the percentage of female criminals at 3% in Japan, the East gener-
ally, South America and some parts of North America. In
some states of the American Union it is 10%; in China, 20%;
in Europe generally it varies between 10% and 21%. In France
the proportion of accused women is fifteen to eighty-five men.
In Great Britain it is now one in four, but has been less. The total
sentenced in 1905-1906 to penal servitude and imprisonment
was 135,389 men and 44,304 women, the balance being made up
of very large convicts. But it is noteworthy that one-seventh of the women committed to prison had already
been convicted from eleven to twenty times. It has been well
said from the above proportions that women are less criminal
according to the figures, because when a woman wants a crime
she can generally find a man to do it for her.

It has often been debated whether or not prison methods react
upon the criminality of the country; whether, in other words,
severity of treatment deter, while milder methods encourage
the wrongdoer to despise the penalties imposed by the law.
Evidence for and against the verdict may be drawn from the
whole civilized world. In England, as judged by the increase
or decrease of the prison population, it might be supposed that
the prison system was at one time effective in diminishing crime.
Between 1878 and 1891 there was a steady decrease in numbers
because of it. More recently there has been an appreciable
increase in the number of crimes and proportionately of those
imprisoned. The figures for 1906 showed a distinct increase in
criminality for that year as compared with the years immediately
preceding. The proportion of indictable offences had increased
in 1906 from 59,079 as against 50,494 in 1899, or in the proportion
of 171-01 per 100,000 of the population as against 158-97, a very
marked increase over earlier years. Nevertheless the figures for
1906, although high, are by no means the highest, as on eight
occasions during the fifty odd years for which statistics were
available in 1906 the total crimes exceeded 60,000, and in the
quinquennial period 1860-1864 the annual average was 280 per
100,000 as compared with 171-01 for 1906 and 175 for the
quinquennial period 1902-1906. The quality of the crime varied,
and while offences against property have increased, those against
the person have constantly fallen. Quite half the whole number
of crimes were committed by old offenders (see RECIDIVISM).

Statistics have not been kept with the same care in all other
countries, but some authentic figures may be quoted for France,
where the number of thefts increased while offences against the
person diminished. In Belgium there has been a satisfactory
decrease in recent years. In Prussia the prison population has
risen, though not so rapidly as in Belgium; but there has been a slight diminution in more serious crime. Some very noticeable figures are forth-
coming from the United States, and comparison is possible of
the relative amount of crime in the two countries, America and
England. Here the want of statistics covering a large period is
much to be regretted. On the general question serious crime in
the ten years between 1880 and 1890 slightly increased, while
petty crime was very considerably less during the period.
Charges for homicide have been much more numerous. There
were in 1880, 4608, or a ratio of 0-1 to 100,000 of the population;
but in 1890 these offences rose to 7351, or a ratio of 11-7. Com-
paring America with England, we have computed in round
numbers that the proportion of prisoners to the general popula-
tion was in the United States as 1 to every 759, and in England
1 to every 1764 persons. As regards the more serious crimes
the number in English convict prisons was as 1 to 10,000, and in the American state prisons (the corresponding institutions) the ratio was 1 to every 1358. In the lesser prisons, i.e. the English local prisons and the American city or county gaols, the numbers more nearly approximate, being in England 1 to 2143 and in America 1 to 1721. It has been argued that much of the crime in America is attributable to the preponderance of foreign immigrants, but the ratio of native born prisoners is that of 1237 to the million, of foreign born prisoners 1777 to the million.

**AUTHORITIES.**—A. MacDonald, Criminology (New York, 1893); A. Drähms, The Criminal (New York, 1900); E. Ferri, La Sociologia criminelle, trans. Ferrier (Paris, 1900); all these contain extensive bibliographies. See also under CRIMINOLOGY. (A. G.)

**CRIMEA** (ancient Taurus or Tauric Chersonese, called by the Russians by the Tatar name Krym or Crim), a peninsula on the north side of the Black Sea, forming part of the Russian government of Tauris, with the mainland of which it is connected by the Isthmus of Perekop (3.4 m. across). It is rudely rhomboid in shape, the angles being directed towards the cardinal points, and measures 200 m. between 44° 23' and 46° 16' N., and 110 m. between 32° 30' and 36° 40' E. Its area is 9700 sq. m.

Its coasts are washed by the Black Sea, except on the north-east, where is the Sivash or Putrida Sea, a shallow lagoon separated from the Sea of Azov by the Arabat spit of sand. The shores are broken by several bays and harbours—on the west side, the north side of the Isthmus of Perekop by the Bay of Karkinit; on the south-west by the open Bay of Kalunitsu, on the shores of which the allies landed in 1854, with the ports of Uzuporia, Sevastopol and Balaklava; by the Bay of Arabat on the north side of the Isthmus of Yenikale or Kerch; and by the Bay of Kaffa or Feodosiya (Theodosia), with the port of that name, on the south side of the same. The south-east coast is flanked at a distance of 5 to 8 m. from the sea by a parallel range of mountains, the Yalta-dagh, a range of Alpine Meadow mountains, and these are backed inland, by secondary parallel ranges; but 75% of the remaining area consists of high arid prairie lands, a southward continuation of the Pontic steppes, which slope gently north-westwards from the foot of the Yaila-dagh: the main range of these mountains shoots up with extraordinary abruptness from the deep floor of the Black Sea to an altitude of 2000 to 2500 ft., beginning at the south-west extremity of the peninsula, Cape Fiolente (anc. Parthenion), supposed to have been crowned by the temple of Artemis in which Iphigeneia officiated as priestess. On the higher parts of this range are numerous flat mountain pastures (Turk. yuslais), which, except for their scanty vegetation, are analogous to the almen of the Swiss Alps, and are crossed by various passes (bojas), of which only six are accessible as carriage-roads. The most conspicuous summits in this range are the Demi-kapu or Kemal-geherk (5040 ft.), Roman-kosh (5060 ft.), Chatyr-dagh (5090 ft.), and Karah-mal (5075 ft). A second parallel range, which reaches altitudes of 1500 to 1900 ft., likewise presents steep crags to the south-east and a gentle slope towards the north-west. In the former slope are thousands of small caverns, probably inhabited in prehistoric times; and several rivers pierce the range in picturesque gorges. A valley, 10 to 12 m. wide, separates this range from the main range, while another valley 2 to 3 m. across separates it from the third parallel range, which reaches altitudes of only 500 to 850 ft. Evidences of a fourth and still lower ridge can be traced towards the south-west.

A number of short streams, none of them anywhere navigable, leap down the flanks of the mountains by cascades in spring, e.g. the Chernaya, Belbek, Kacha and Alma, to the Black Sea, and the Salghir, with its affluent, the Kara-su, to the Sivash lagoon.

In point of climate and vegetation there exist marked differences between the open steppes and the south-eastern littoral, with the slopes of the Yaila-dagh behind it. The former, although grasses and Liliaceae grow on them in great variety and luxuriance in the early spring, become completely parched up by July and August, while the air is then filled with clouds of dust. There also high winds prevail, and snowstorms, hailstorms and frost are of common occurrence. Nevertheless this region produces wheat and barley, rye and oats, and supports numbers of cattle, sheep and horses. Parts of the steppes are, however, impregnated with salt, or studded with saline lakes; there nothing grows except the usual species of Artemisia and Salsola. As a rule water can only be obtained from wells sunk 200 to 300 ft. deep, and artesian wells are now being bored in considerable numbers. All over the steppes are scattered numerous kurgans or burial-mounds of the ancient Scythians. The picture which lies behind the sheltering screen of the Yaila-dagh is of an altogether different character. Here the narrow strip of coast and the slopes of the mountains are smothered with greenery. This Russian Riviera stretches all along the south-east coast from Cape Sarych (extreme S.) to Feodosiya (Theodosia), and is studded with summer sea-bathing resorts—Alupka, Yalta, Gurzuf, Alushta, Sudak, Theodosia. Numerous Tatar, German, Karaites, Jews, Greeks and a few Albanians. The total in 1897 was 55,950, of whom only 10,000 lived in the towns. Simferopol is the chief town; others of note, in addition to those already named, are Eupatoria and Bakhchisarai, the old Tatar capital.

**History.**—The earliest inhabitants of whom we have any authentic traces were the Celtic Cimmerians, who were expelled
CRIMEAN WAR

by the Scythians during the 7th century B.C. A remnant, who took refuge in the mountains, became known subsequently as the Tatars. It was during this period that the ancient Greek colonists began to settle on the coasts, e.g. Dorians from Heraclae at Chersonesus, and Ionians from Miletus at Theodosia and Panticapaeum (also called Bosporus). Two centuries later (438 B.C.) the archon or ruler of the last-named assumed the title of king of Bosporus, a state which maintained close relations with Athens, supplying that city with wheat and other commodities. The last of these kings, Paerisades V., being hard pressed by the Scythians, put himself under the protection of Mithridates VI., king of Pontus, in 114 B.C. After the death of this latter sovereign his son Pharnaces, as a reward for assistance rendered to the Romans in their war against his father, was (63 B.C.) invested by Pompey with the kingdom of Bosporus. In 15 B.C. it was once more restored to the king of Pontus, but henceforward ranked as a tributary state of Rome. During the succeeding centuries the Crimea was overrun or occupied successively by the Goths (A.D. 250), the Huns (376), the Khazars (6th century), the Byzantine Greeks (1016), the Kipchaks (1050), and the Mongols (1237). In the 13th century the Genoese destroyed or seized the settlements on which their rivals the Venetians had made outposts on the Crimean coasts, and established themselves at Euatoria, Cembalo (Balaklava), Soldaia (Sudak), and Kaffa (Theodosia), flourishing trading towns, which existed down to the conquest of the peninsula by the Ottoman Turks in 1475. Meanwhile the Tatars had got a firn footing in the northern and central parts of the peninsula as early as the 13th century, and after the destruction of the Golden Horde by Tamerlane they founded an independent khunate under a descendant of Jenghiz Khan, who is known as Hadji Ghirai. He and his successors reigned first at Sokhat (Esni-krym), and from the beginning of the 15th century at Bakhchi-sarai. But from 1475 they ruled as tributary princes of the Ottoman empire down to 1777, when having been defeated by Suvarov they became dependent upon Russia, and finally in 1783 the whole of the Crimea was annexed to the Russian empire. Since that date the only important phase of its history has been the Crimean War of 1854-56, which is treated of under a separate article. At various times, e.g. after the acquisition by Russia, after the Crimean War of 1854-56, and in the latter half of the century, the Tatars emigrated in large numbers to the Ottoman empire.

CRIMEAN WAR. The war of 1853-56, usually known by this name, arose from the causes of which the discussion will be found under the heading TURKEY: History. When Turkey, after a period of irregular fighting, declared war on Russia in October 1853, Great Britain and France (subsequently assisted by Sardinia) intervened in the quarrel. At first this intervention was represented merely by the presence of an allied squadron in the Bosporus, but the storm of indignation aroused in Great Britain and France by the destruction of the Turkish fleet at Sinope (20th November) soon impelled these powers to more active measures. On the 27th of January 1854 they declared war on the tsar, and prepared to carry their armaments to the Danube. In this, the main, theatre of war, the Turks had hitherto proved quite capable of holding their own. The Russian commander, Prince Michael Gorchakov, had crossed the Pruth with two corps early in July 1853, and had overrun Moldavia and Wallachia without difficulty. Omar Pasha, however, disposing of superior forces, was able to check any further advance. During October, November and December the Turks won a succession of actions, of which that at Oltenitza

army hastily fell back, and on the 2nd of August 1854 the last man recrossed the Pruth. The principalities were at once occupied by Hess.

The Invasion of the Crimea.—The primary object of the war had thus easily been obtained. But Great Britain and France were by no means content with a triumph that left untouched the vast resources of an enemy who was certain to employ them at the next opportunity. The two nations felt that Sevastopol, the home of the Black Sea fleet, the port whence Admiral Nakhimov had sailed for Sinope, must be crippled for some years at least, and as early as June 29th Lord Raglan and Marshal Saint Arnaud, the allied commanders of England and France, had received instructions to "concert measures for the siege of Sevastopol." Dynastic considerations reinforced the arguments of policy and popular opinion in the case of France; in Great Britain soldier and civilian alike saw the menace of a Russian Mediterranean fleet in the unfinished forts and busy dockyards. The popular strategy for once coincided with the views of the responsible leaders. Yet there is no sign that either the commanders on the spot or their governments realized the magnitude of the undertaking. Few but the most urgently necessary preparations were made, and cholera, breaking out virulently amongst the French at this time, reduced the

army

Nov. 4th) may be particularly mentioned, and a little later Gorchakov found himself compelled to fight at Cetaea (Tchetati) before reinforcements could come up. The defeat he sustained was for the time being decisive (6th Jan. 1854). Three months later, the Russians, now under command of the veteran Prince Paskleivich, took the offensive in great force. Crossing the Danube near its mouth at Galatz and Braila, they advanced through the Dobrudja and closed upon the fortress of Silistria, which offered a strong and steady resistance, with an effect all the greater as the Turks from the side of Shumla, now supported by the leading British and French brigades at Varna, prevented a close investment. The Turks, however, avoided a decisive encounter, and the stormers stood ready in the trenches before Silistria, when the siege was suddenly raised. The decision had passed into other hands. The tsar had learned that the Austrian army of observation in Transylvania, 50,000 strong under Feldzeugmeister Hess, was about to enforce the wishes of the "Four Powers." The Russian offensive was at an end, the
at Varna, and even the fleet at sea, to impotence. The troops were so weakened that, even in September, the five-mile march from camp to transport exhausted most of the men. Heavy weather still further delayed the start, and it was not until the 7th of September that the expedition began to cross the Black Sea. One hundred and fifty war-vessels and transports conveyed the army, which, guarded on all sides by the fighting fleet, crossed without incident and drew up on the Crimean coast on September 13th. Tactical considerations prevailed in the choice of place. The landlocked harbours south of Sevastopol were for the time being neglected, and a spot known as Old Fort preferred, because the long beach, the heavy metal of the ships' broadsides, and a line of lagoons covering the front offered singularly favourable conditions for the delicate operation of disembarkation. Still, on this side of Sevastopol there was no good harbour, and it is quite open to question whether in this case the strategic necessities of the situation were not neglected in favour of purely tactical and temporary advantages. As a matter of fact no opposition was offered to the landing, but the weather prevented the disembarkation being completed until the 18th. St Arnaud and Raglan had at this time crossed their depots, French, Front and Turkish infantry, 10,000 British cavalry, and 128 guns, and on the 19th this force (less some detachments) began the southward march in order of battle, the British (who alone had their cavalry present) on the exposed left flank, the French next the sea, the fleet moving in the same direction parallel to the troops.

The Alma.—Old Fort was beyond the reach of Menshikov, the Russian commander, but, as the fortress communicated with the interior of Russia via Kerch and Simferopol, it was to be expected that he would either accept battle on the Sevastopol road, or cover Simferopol by a flank attack on Lord Raglan. Both these contingencies were provided for by the order of march, and in due course it was ascertained that the Russians adopted the former alternative, and barred the Sevastopol road on the heights of the river Alma. Menaced by the guns of the fleet, Menshikov had wheeled back his left, and at the same time he strengthened his right in order to cover the Simferopol road. From this it followed naturally that the brunt of the attack fell upon the British divisions, whilst the French, nearer the sea, struck to some extent dans le vide. The two commanders, after a reconnaissances, decided upon their plan. The French divisions in echelon from the right were to cross the river and force Menshikov inwards, whilst the British were to move straight to their front against the strongest part of the Russian line. Substantially this plan was carried out on the 20th of September. Owing to want of men (he had but 36,400 against 50,000) Menshikov was unable to hold his left wing very strongly, and the French were scarcely checked save by physical obstacles; but opposite the British force the ground sloped glacis-wise up to the Russian line, and nothing but their iron discipline, the best heritage of the Peninsular War, brought them victorious to the crest of Kurghane hill. The Russians had no option but to retreat, which they did without molestation. The allies lost about 4,000 men, mostly British (though Prince Napoleon's men also suffered heavily); the Russians reported 5,000 casualties.

The Siege.—On the 23rd of September the advance was resumed, and by the 25th Sevastopol was in full view of the allied outposts. It was now that the necessary consequences of the choice of Old Fort as the landing-place presented themselves as a problem for instant solution. Whatever chance there had been of assaulting the north side of Sevastopol was now gone. Menshikov had sacrificed some ships in order to seal up the harbour mouth, and naval co-operation in attack was now impossible, while the other Russian ships could in safety aid the defenders with their heavy guns. A siege, based on the beach of Old Fort or the open roads of Kacha, was out of the question, as was re-embarkation for a fresh landing. There remained only a flank march by Mackenzie's farm and the river Chernaya. Once established on the south side, the allies could use the excellent harbours of Kamish and Balaklava; this could almost certainly be effected without fighting, while in besieging Sevastopol itself and not merely the north side, the allies would be striking at the heart. But a flank march is almost always in itself a hazardous undertaking, and in this case the invaders were required further to abandon their line of retreat on Old Fort. In point of fact, the army, covered by a division opposite the Russian works, successfully accomplished the task. At the same moment Menshikov, after providing for the defence of Sevastopol, had marched out with a field army towards Bakhchisarai, and on the 25th of September each army, without knowing it, actually crossed the other's front. On arrival at Balaklava the allies regained contact with the fleet, and the detachment left on the north side, its mission being at an end, followed the same route and rejoined the main body. The French now took possession of Kamish, the British of Balaklava.

Beginning of the Siege.—Thus secured, the allies closed upon the south side of the fortress. A siege corps was formed, and the British army and General Bosquet's French corps covered its operations against interruption from the Russian field army. The harbour of Sevastopol, formed by the estuary of the Chernaya, was protected against attack by sea not only by the Russian war-vessels, afloat and sunken, but also by heavy granite forts on the south side and by the works which had defied the allies on the north. For the town itself and the Karabelnaya suburb the trace of the works had been laid down for years. The Malakoff, a great tower of stone, covered the suburb, flanked on either side by the Redan and the Little Redan. The town was covered by a line of works marked by the Flagstaff and central bastions, and separated from the Redan by the inner harbour. Lieut.-Col. Toddleben, the Russian chief engineer, had very early begun work on these sites, and daily reconstructing, tearing down and improving the fortifications, finally connected them by a continuous enceinte. Yet Sevastopol was not, early in October 1854, the towering fortress it afterwards became, and Toddleben himself maintained that, had the allies immediately assaulted, they would have succeeded in taking the place. There were, however, many reasons against so decided a course, and it was not until the 17th of October that the first attack took place. All that day a tremendous artillery duel raged. The French siege corps lost heavily and its guns were overpowered. The fleet engaged the harbour batteries close inshore, and suffered a loss of 300 men, besides severe damage to the ships. On the other hand the British siege batteries silenced the Malakoff and its annexes, and, if failure had not occurred at the other points of attack, an assault might have succeeded. As it was, Toddleben, by daybreak, had repaired and improved the damaged works. Meanwhile General Canrobert had succeeded St Arnaud (who died on the 29th of September) in the joint leadership of
the allies. It was not long before Menshikov and the now augmented field army from Bakhchisarai appeared on the Chernaya and moved towards the Balaklava lines and the British base.

Balaklava.—A long line of works on the upland secured the siege corps from interference, and the Balaklava lines themselves were strong, but the low Vorontsov ridge between the two was weakly held, and here the Russian commander hoped to sever the line of communications. On the 25th of October Liprandi's corps carried its slight redoubts at the first rush. But the British cavalry stationed at the foot of the upland was situated on their flank, and as the Russian cavalry moved towards Kadikof, the "Heavy Brigade" under General Scarlett charged home with such effect that Menshikov's troopers only rallied behind their field batteries near Traktir bridge. At the same time some of the Russian squadrons, coming up the British 3rd regiment outside the Balaklava lines, were completely broken by the steady volleys of the "thin red line." The "Light Brigade" of British cavalry, farther north, had hitherto remained inactive, even when the Russians, broken by the "Heavies," fled across their front. The cavalry commander, Lord Lucan, now received orders to prevent the withdrawal of the guns taken by Liprandi. The aide-de-camp who carried the order was killed by the first shell, and the whole question of responsibility for what followed is wrapped in obscurity. Lord Cardigan led the Light Brigade straight at the Russian field batteries, behind which the enemy's squadrons had re-formed. From the guns in front, on the Fedukhin heights, and on the captured ridge to their right, the advancing squadrons at once met a deadly converging fire, but the gallant troopers nevertheless reached the guns and cut down the artillerymen. Small parties even charged the cavalry behind, and at last two unbroken squadrons struck out right and left with success, but the combat could only end in one way. The 4th Chasseurs d'Afrique relieved the British left by a dashng charge. The "Heavies" made as if to advance, but came under such a storm of fire that they were withdrawn. By twos and threes the gallant survivors of the "Light Brigade" made their way back. Two-thirds of its numbers were left on the field, and the day closed with the Russians still in possession of the Vorontsov ridge.

Inkerman.—If the heights lost in this action were not absolutely essential to the safety of the allies, the point selected for the next attempt at relief was of vital importance. The junction of the covering army and the siege corps near Inkerman was the scene of a slight action on the day following Balaklava, and the battle of Inkerman followed on the 5th of November. By that time the French had made good the losses of the 17th of October, their approaches were closing upon Flagstaff bastion, and the British batteries daily maintained their superiority over the Malakoff. On the 5th there was to have been a meeting of generals to fix the details of an assault, but at dawn the Russian army, now heavily reinforced from Odessa, was attacking with the utmost fury the British divisions guarding the angle between Bosquet and the siege corps. The battle of Inkerman did not only involve every French regiment, but each bore its own separate part in the confused and doubtful struggle, save when leaders on either side obtained a momentary control over its course by means of reserves which, carrying all before them with their original impetus, soon served but to swell the mêlée. It was a "soldiers' battle" pure and simple. After many hours of the most desperate fighting the arrival of Bosquet (hitherto contained by a force on the Balaklava ground) confirmed a success won by supreme tenacity against overwhelming odds, and Menshikov sullenly drew off his men, leaving over 12,000 on the field. The allies had lost about 3,300 men, of whom more than two-thirds belonged to the small British force on which the strain of the battle fell heaviest. Their losses included several generals who could ill be spared, but they had held their ground, which was all that was required of them, with almost unrivalled tenacity. Lord Raglan was promoted to field marshal after the battle.

The Winter of 1854-1855.—It was now obvious that the army must winter in the Crimea, and preparations in view of this were begun betimes. But on the night of November 14 a violent storm arose which wrecked nearly thirty vessels with their precious cargoes of treasure, medical comforts, forage, clothing and other necessaries. After so grave a calamity it was to be expected that the troops would be called upon to undergo great hardships. But the direct cause of sufferings that have become a byword for the utmost depths of misery was the loss of twenty days' forage in the great storm. Of food and clothing enough was in store to tide over temporary difficulties, but the only paved road from Balaklava to the British camps was now in Russian hands, and the few starving transport animals were utterly inadequate for the work of drawing wagons over the miry plain; things went from bad to worse with Raglan's troops, until from the outposts before the Redan to the hospitals at Scutari a state of the utmost misery prevailed, relieved only by the example of devotion and self-sacrifice set by officers and men. The British hospital returns showed eight thousand sick by the end of November. Even the French, whose base of Kamish had escaped the storm, were not unhurt by the severity of the winter, but Napoleon III. sent an urgent and far-reaching appeal to his generalissimo, and the Russians in Sevastopol, who had made long painful marches from the interior, were the survivors of the fittest. Canrobert took over the lines before the Malakoff to relieve the British. He had at the end of January 1855 78,000 men for duty; Raglan could barely muster 12,000. But, with the advent of spring, paved roads and a railway were promptly taken in hand, and during the remainder of the war the British troops were so well cared for that their death-rate was lower than at home, while the hospitals in rear, thanks to the energy and devotion of Florence Nightingale and her nurses, became models of good management.

Course of the Siege.—Meanwhile the siege works were making but slow progress, and the fortress grew day by day under the skillful direction of Todleben. Rifle-pits pushed out in front of the defenders' lines were connected so as to form a veritable enfilade. Beyond the left wing a new line, the "White Works," sprang up in a single night, and the hill of the Mamelon was suddenly crowned with a lunette to cover the still defiant Malakoff. But the absence of bomb-proof cover exposed the huge working parties necessary for these defences to an almost incessant feu d'enfer, by which the Russians every week suffered the losses of a pitched battle. Meanwhile the field army was idle, Menshikov had been replaced by Prince Michael Gorchakov, Liprandi's corps had withdrawn from the Vorontsov ridge, and Omar Pasha, with a detachment of the troops he had led at Oltenitza and Cetatea, repulsed a Russian attack on Eupatoria (Feb. 17th). The besiegers steadily approached the White Works, Mamelon, Redan and Flagstaff bastion, and as spring arrived the logistic and material advantages of the allies returned. On Easter Sunday (April 8th, 1855) another terrific bombardment began, which lasted almost uninterruptedly for ten days. The White Works and the Mamelon were practically destroyed, and the Russians, drawn up in momentary expectation of assault, lost between six and seven thousand men.

But the bombardment ceased and the Allies did not follow. For, at the allied headquarters and at Paris, grave differences of opinion on the conduct of the war had developed. Napoleon III. wished active operations to be undertaken against the Simferopol field army, whereas the leaders on the spot, while admitting the theoretical soundness of the French emperor's views, considered that they were wholly beyond the means of the two armies. The discussions culminated in Canrobert's resignation of the chief command, though he would not leave the army, and took a subordinate post, which he filled with great distinction to the end of the war. His successor, General Pélissier, was a soldier trained in the hard school of Algerian warfare, and endowed, as was soon evident, with the most inflexible resolution of character. He did not hesitate to take up and maintain a position of decided opposition to his sovereign's views; and the capture of Kerch (24th May 1855), carried out by a joint expedition, was the first earnest of new vigour in the
operations. This success served all the purposes of a complete investment of Sevastopol, the want of which had greatly troubled the allied generals. The line of communication and supply between Sevastopol and the interior was cut, vast stores intended for the fortress were destroyed, and the sea of Azov was cleared of shipping. On the 25th Canrobert established himself on the Fedukhin heights, his right continued along the Chernaya by General la Marmora's newly arrived Sardinians, 15,000 strong, while masses of Turks occupied the Vorontsov ridge and the old Balaklava battlefield.

As June approached, Raglan and Pélissier, who, unlike most allied commanders, were in complete accord and sympathy, initiated very vigorous methods of attack. They decided that the works west of Flagstaff could be comparatively neglected, and the full weight of the bombardment once more fell upon the Melamont and the Malakoff. Once more these works were reduced to ruins, but the rest of the defences still held out.

The Assault of the Redan.—On the 7th of June 1855 the French stormed the Melamont and the White Works, the British captured and maintained some quarries close to the Redan, and next morning the whole of Todleben's envelope had become a siege parallel. The losses were usual, heavy, 8500 to the Russians, 6833 to the allies. This was merely a preliminary to the great assault fixed for the 18th, the fourteenth anniversary of Waterloo. But meanwhile Pélissier's temper and Raglan's health had been strained to breaking-point by continued dissensions with Paris and London. The telegraph, a new strategic factor, daily tormented the unfortunate commanders with the latest ideas of the Paris strategists, and on the fateful day the two armies rushed on to failure. The French attack on the Malakoff dwindled away into a meaningless fire-fight: the British, attacking the Redan in face of a cross-fire of one hundred heavy guns, at first succeeded in entering the work, but in the end sustained a bloody and disastrous repulse. Of the six generals who led the two attacks, four were killed and one wounded, and on the 17th and 18th the losses to the Russians were 5500, to the allies 4000. But the defenders' resources were almost at an end, and the bombardment reopened at once with increased fury. On the 20th Todleben was wounded, and soon afterwards Nakhimov, the victor of Sinope, found a grave by the side of those he had won. His last words to his planning General resolutely clung to his plans, in spite of the failure of the 18th, against ever-increasing opposition at home. Raglan, worn out by his troubles and heartbroken at the Redan failure, died on the 28th, mourned by none more deeply than by his stern colleague.

The Storming of the Malakoff.—During July the Russians lost on an average 250 men a day, and at last it was decided that Gorchakov and the field army must make another attack at the Chernaya—the first since Inkerman. On the 16th of August the corps of Generals Liplandi and Read furiously attacked the 37,000 French and Sardinian troops on the heights above Traktir Bridge. The assailants came on with the greatest determination, but the result was never for one moment doubtful. At the end of the day the Russians drew off baffled, leaving 260 officers and 8000 men on the field. The allies only lost 1700. With this defeat vanished the last chance of saving Sevastopol. On the same day (Aug. 16th) the bombardment once more reduced the Malakoff and its dependencies to impotence, and it was with absolute confidence in the result that Pélissier planned the next assault.

On the 8th of September, 1855, at noon, the whole of Bosquet's corps suddenly swarmed up to the Malakoff. The fighting was of the most desperate kind. Every casemate, every traverse, was taken and retaken time after time, but the French maintained the prize, and though the British attack on the Redan once more failed, the Russians crowded in that work became at once the helpless target of the siege guns. Even on the far left, opposite Flagstaff and Central bastions, there was severe hand-to-hand fighting, and throughout the day the bombardment mowed down the Russian masses along the whole line. The fall of the Malakoff was the end of the siege. All night the Russians were filing over the bridges to the north side, and on the 9th the victors took possession of the empty and burning prize. The losses in the last assault had been very heavy, to the allies over 10,000 men, to the Russians 13,000. No less than nineteen generals had fallen on that day. But the crisis was surmounted. With the capture of Sevastopol the war loses its absorbing interest. No serious operations were undertaken against Gorchakov, who with the field army and the remnant of the garrison held the heights at Mackenzie's Farm. But Kinburn was attacked by sea, and from the naval point of view the attack is interesting as being the first instance of the employment of ironclads. An armistice was agreed upon on the 26th of February and the definitive peace of Paris was signed on the 30th of March 1856.

Decisive Importance of the Victory.—The importance of the siege of Sevastopol, from the strategical point of view, lies beneath the surface. It may well be asked, why did the fall of a place, at first almost unfortified, bring the master of the Russian empire to his knees? At first sight Russia would seem to be almost invulnerable to a sea power, and no first success, however crushing, could have humbled Nicholas I. Indeed the capture of Sevastopol in October 1854 would have been far from decisive of the war, but once the threat had decided to defend to the last this arsenal, the necessity for which he was in the best position to appreciate, the factor of unlimited resources operated in the allies' favour. The sea brought to the invaders whatever they needed, whilst the desert tracks of southern Russia were marked at every step with the corpses of men and horses who had fallen on the way to Sevastopol. The hasty nature, too, of the fortifications, which, daily crushed by the fire of a thousand guns, had to be re-created every night, made huge and therefore unprotected working parties necessary, and the losses were correspondingly heavy. The double cause of loss completely exhausted even Russia's resources, and, when large bodies of militia appeared in line of battle at Traktir Bridge, it was obvious that the end was at hand. The novels of Tolstoy give a graphic picture of the war from the Russian point of view; the miseries of the desert march, the still greater miseries of life in the casemates, and the almost daily ordeal of manning the lines under shell-fire to meet an assault that might or might not come; and no student of the siege can leave it without feeling the profoundest respect for the courage, discipline and stubborn loyalty of the fallen. Minor Operations.—A few words may be added on the minor operations of the war. The Asiatic frontier was the scene of severe fighting between the Turks and the Russians. Hindered at first by Shamyl and his Caucasian mountaineers, the Russians stood on the defensive during 1853, but next year they took the offensive, and, while their coast column won an action on the 16th of June at the river Churuk, another force from Erivan gained an important success on the Araxes and took Bayazid, and General Bebutov completely defeated a Turkish column from Kars at Kuruk Dere (July 31st, 1854). Next year Count Muraviev completely isolated the garrison of Kars, which made a magnificent defence, inspired by Fenwick Williams Pasha and other British officers. In one assault alone 7000 Russians were killed and wounded, and it was not until the 26th of November 1855 that the fortress was forced to surrender. The naval operations in the Baltic furnish many interesting examples for the study of naval war. The allied fleet in 1854, after a first repulse, succeeded in landing a French force under Baraguay d'Hilliers before Copenhague and then fell after an eight days' siege. In 1855 seventy allied warships appeared before Kronstadt, which defied them. Reinforced they attacked Svedborg, but after two days' fighting had to draw off baffled.

The numbers engaged in the Crimean War and the cost in men and money is stated in round numbers below. In May 1855 the Crimean theatre of war occupied 174,500 allies (of whom 32,000 were British) and 170,000 Russians. The losses in battle were: allies 70,000 men, Russians 128,700; and the total losses, from all causes and in all theatres of the war: allies 252,600 (including 45,000 English), Russians 256,000 men (Berndt, Die Zahl im Kriege, p. 33). In the siege of Sevastopol the Russians are stated by Berndt to have lost 102,670 men dead, wounded and missing.
CRIMINAL LAW

Mulhall (Dict. of Statistics, 1903 ed., pp. 586-587) gives much greater losses to each of the four powers principally engaged. The cost of the war in money is stated by Mulhall to have been £60,000,000 to Great Britain, £53,000,000 to France, £142,000,000 to

AUTHORITIES.—Of the many works on the Crimean War those of the greatest value are the following: English: the official work on The Siege of Sebastopol; A. W. Kinglake, The Invasion of the Crimea (London, 1853); "Student's edition" by Sir G. S. Clarke; Sir E. B. Hamley, The War in the Crimea (London, 1891); (Sir) W. H. Russell, The War in the Crimea (London, 1855-1856); Sir Evelyn Wood, The Crimes in 1854 and in 1855 (London, 1895); Sir D. Lysons, The Crimean War from First to Last (London, 1895); Col. A. Lake, The Defense of Kars (London, 1857); French: Official, Guerre du Crimée (Paris, 1859); (Marshal Niel), Siège de Sébastopol (official account of engineer operations, Paris, 1858), and Atlas historique et topographique de la guerre de Crimee (see also the map of Russia by the French staff, sheets 50 and 57; Baron C. de Bazoancourt, L'Expédition d'Orient (Paris, 1856); C. Roussel, Histoire de la guerre de Crimée (Paris, 1877). Russian: the work of Todleben, Die Vertheidigung von Sebastopol (St Petersburg, 1864); Défense de Sébastopol (St Petersburg, 1863); Anitschkoff, Feldzug in der Krim (Berlin, 1864); Le Donaufeldzug (Paris, 1859); Sir J. E. Chalmers, Kars (London, 1864); Sir John Hamilton, Kars (London, 1864); (Sir) W. H. Russell, Kars (London, 1864). German works the most useful are: Kupstmann, Die Schlechtten und Tiefs des Krimkrieges (Berlin, 1864); Der Feldzug in der Krim: Sammlung der Berichte beider Parteien (Leipzig, 1855-1856).

CRIMINAL LAW. By criminal, or penal, law is now understood the law as to the definition, trial and punishment of crimes, i.e. of acts or omissions forbidden by law which affect injuriously public rights, or constitute a breach of duties due to the whole community. The sovereign is taken to be the person injured by the crime, as he represents the whole community, and prosecutions are in his name. Criminal law includes the rules as to prevention, the investigation, prosecution and punishment of crime (q.v.). It lays down what constitutes a criminal offence, what proof is necessary to establish the fact of a criminal offence and the culpability of the offender, what excuse or justification for the act or omission can be legally admitted, what procedure should be followed in a criminal court, what degrees and kinds of punishment should be imposed for the various offences which come up for trial. Finally, it regulates the constitution of the tribunals established for the trial of offences according to the great criminal code of law, and deals with the organization of the police and the proper management of prisons, and the maintenance of prison discipline. (See EVIDENCE; PRISON; POLICE.)

Many acts or omissions, which are technically criminal and classified as offences and punished by fine or imprisonment, cannot be said to have a strictly criminal character, since they do not fall within the popular conception of crime. To this class belong such matters as stopping up a highway under claim of right, or failing to repair it, or allowing a chimney to emit black smoke in excessive quantities, or to catch fire from being unswept, or breach of building by-laws, or driving a motor car on a highway at a speed in excess of the legal limit. Such breaches of law are under the French law described as contraventions. In England most of them are described as petty misdemeanours or offences punishable on summary conviction, or less happily as "summary offences," and some writers speak of them as mala prohibita as distinguished from mala in se, i.e. as not involving any breach of ordinary morality or penalties of punishment. Continental jurists at times speak of crimes de droit commun (i.e. offences common to all systems of law as distinguished from offences which are crimes only by a particular municipal law). To this class of crimes de droit commun belong most of the offences included in extradition treaties.

Criminal and civil law overlap, and many acts or omissions are not only "wrongs" for which the person injured is entitled to recover compensation for his own personal injury or damage, but also "offences" for which the offender may be prosecuted and punished in the interest of the state. In non-English European systems care is taken to prevent civil remedies from being extinguished by punishment: it is quite usual for the civil and criminal remedies to be pursued concurrently, the individual appearing as partie civile and receiving an award of compensation by the judgment which determines the punishment to be inflicted for the offence against the state. Under English law it is now exceptional to allow civil and criminal remedies to be pursued concurrently or in the same proceeding, or to award compensation to the injured party in criminal proceedings, and he is usually left to seek his remedy by action. Among the exceptions are the restitution of stolen goods on conviction of the thief if the prosecution has been at the instance or with the aid of the owner of the goods (Larceny Act 1861, § 100), and the award of compensation to persons who have suffered injury to property by felony (Forfeiture Act 1870).

As Sir Henry Maine says (Ancient Law, ed. 1906, p. 381), "All civilized systems of law agree in drawing a distinction between offences against the state or community (crimes or crimina) and offences against the individual (wrongs, torts or delicta)." But the process of historical development by which this distinction has been ultimately established has given great occasion for study of early laws and institutions by eminent men, whose researches have disclosed the extremely gradual evolution of the modern notion of criminal law, as against the older conceptions and customs of barbarous or semi-civilized communities. Of the oldest codes or digests of customs which are available to the student it has been said the more archaic a code the fuller and minuter is its penal legislation: but this penal legislation is not true criminal law; it is the law, not of crimes, but of wrongs. The intervention of the community or tribe is in the first instance to persuade or compel the wronged person or his family or tribe to abandon private vengeance or a blood feud and to accept compensation for the wrong collectively or individually sustained; and in the tariffs of compensation preserved in early laws the importance of the injured person was the measure of the compensation or vengeance which he was recognized to be entitled to exact, and the scales of punishment or compensation are fixed from this point of view.

The laws of Khammurabi (2285-2242), the oldest extant code, contain definite schemes and scales of offences and punishments, and indicate the existence of tribunals to try the offences and to award the appropriate remedy. The modern criminal law is a logical development from that primitive stage. The question remains whether the proceedings were at the instance of the state or the person wronged, but compensation and penalty could be awarded in the same proceeding, and the provisions as to the lex talionis and scale of compensation for injuries tend to show that the procedure was on private complaint and not on behalf of the state (see further BABYLONIAN LAW).

Of the early criminal laws of Greece only fragments survive, e.g. those of Solon and Draco. In Athens in early times crime was dealt with in the Areopagus from the point of view of religion and by the archons from the point of view of compensation: and it was only when the state interests were directly affected that proceedings by way of ἀθανατήμα or imprisonment were taken. In classical times crimes fell to be tried by panels of jurors or judges drawn from the assembly and described as δικαιοσύνη.

The earliest materials for ascertaining the criminal law of Rome are to be found in the Twelve Tables, Table VIII. The criminal law of Imperial Rome is collected in books 47-48 of the Digest. The classification of crime therein is capricious and anomalous. "In the early Roman law the idea of legislative power was so fully grasped and that of judicial power so little understood that the criminal jurisdiction arose in the form of a legislative enactment applicable to particular cases." Crimes were classified according to the mode of proceeding into:

1. Publica judicia, dealing with crimes specifically forbidden by definite laws, which took the place of the standing commissions (quaestiones perpetue) of the time of the Republic.

In the earlier stages of Roman law the state only interfered to punish offences which gravely affected it, and did so by privilegia, which correspond to imprisonment or Bill of Pains and Penalties.
2. Extraordinary crima, crimes for which no special procedure for punishment was provided: the punishment being, within limits, at the discretion of the judge and the prosecution to the injured party.

3. Privata delicta, offences for which a special form of action was open to the injured party, e.g. actio furti.

The multiplicity of tribunals under the republic was replaced under the empire by a complete organization of the judiciary throughout the districts (dioceses) under the supervision of the emperor in his privy council (see Maine, *Ancient Law*, ed. 1906, p. 393). Public prosecution under the empire began by arrest of the accused, who was taken before an eirenarcha, who examined him (by torture in the case of a slave or parricide) and sent him on trial before the præses of the diocese (iudicium). Private prosecution followed, a procedure closely resembling that of civil actions, beginning with citatio (summons), followed by libellus or accusation, and appointment of a day for hearing. The right of either party to call witnesses was very imperfectly established.

The early laws of the Celtic races are preserved as to Wales in the laws of Hywel Dda, and as to Ireland in the Book of Brehon. Aicill and other Brehon law tracts, which are professional collections of precedents and formulæ made by the hereditary law caste (Brehons), whose business it was "to pass sentence from precedents and commentaries." (See *Brehon Law*. The development of Celtic law was arrested by the Saxon and Anglo-Norman conquest: but the materials preserved indicate an origin common with that of Germanic law.

The special characteristics of Irish criminal law, if it can be so called, were:

1. The law was customary and theoretically unchangeable, and no legislative or judicial authority existed to alter or enforce it.

2. All crimes were treated as wrongs, for which compensation was made by assessment of damages by a consensual tribunal whose power to make awards depended on submission of the parties and the ultimate sanction of public opinion or custom. A customary tariff for compensation existed for all offences from wilful murder downwards. No crime was unamenable. The Irish law recognized a body price or compensation (S. bot) and an honour price or eric (S. wer), for which the family or tribe of the offender was collectively liable; but there is no clearly ascertained equivalent to the Saxon wite, or fine to the chief.

The laws of the Germanic tribes, so far as preserved in the *Germania* of Tacitus, and in the compilations of customs known as the Salic and Ripuarian laws, the Leges Barbarorum, the Dooms of Æthelberht and the collections of the royal law and the collections of Anglo-Saxon law and custom (to be found in Thorpe's *Anglo-Saxon Law*), do not indicate any adequate or definite division between crimes and causes of civil action, but, like the laws of Babylon, recognize the system and contain the tariffs of compensation for wrongs. The idea of the compensation was originally to put an end (jims) to blood feuds and private war or vengeance. These laws formed the foundation of the criminal law of Germany, including the Netherlands, of England and of Scandinavia. But in each country the development of criminal law has been affected by influences other than Germanic, mainly consisting in an infusion more or less vast of ideas derived from Roman law. In England under Alfred some part of the Levitical law (Exod. xxi. 12-15) was incorporated, just as in 1567 the criminal law as in civil law was taken bodily from Leviticus xviii.

The stage which the development of criminal law had reached in England by the reign of Edward the Confessor is thus described by Pollock and Maitland (*Hist. Eng. Law*, ii. 447): "On the eve of the Norman Conquest what we may call the criminal law of England (but it was also the law of torts or civil wrongs) contained four elements which deserve attention: Its past history is in which consisted of the varying relations between. We have to speak of outlawry, of the blood feud (fjadus), of the tariffs of wer and wite (fredus or friede), and bot, of punishment in life and limb. As regards the malefactor the community may assume one of four attitudes: it may make war on him; it may have him exposed; it may have him serve as a slave; it may force him to make atonement; it may inflict on him a determinate punishment, death, mutilation or the like." The wite or sum paid to the king or lord is now thought to have been originally not a penalty but a fee for time and trouble taken in hearing and determining a controversy. But at an early stage fines for breach of peace were imposed. An evil result from the public point of view followed from the system of atoning for crime by pecuniary mulct. "Criminal jurisdiction became a source of revenue." So early as Canute's time certain crimes were pleas of the crown; but grants of criminal jurisdiction, with the attendant forfeitures, were freely made to prelates, towns and lords of manors, and some traces of this jurisdiction still survive (e.g. the criminal jurisdiction of the justices of the soke (soc) of Peterborough, and the rights of some boroughs, e.g. Nottingham, to forfeitures). Outlawy soon ceased to be a mode of punishment, and became, as it still is, a process to compel submission to justice (Crown Office Rules, 1906, rules 88-110). Certain crimes, such as murder, rape, arson and burglary, became unamenable or bootless, i.e. placed the offender's life, limb, lands and goods at the king's mercy. These crimes came to be generally described by the name felony (g.n.). Other crimes became punishable by fines which took the place of wites. These were styled trespasses and correspond to what is now called misdemeanour (g.n.).

Minor acts of violence, dishonesty or nuisance, were dealt with in seigniorial and borough courts by presentment of the jurors of courts baron and courts leet, and punished by fine or in some cases by pillory, tumbril or stocks. Grave acts were dealt with by the sheriff as breaches of the peace. He sat with the freeholders in the county court, which sat twice a year, or in the hundred court, which sat every four weeks. So far as this involved dealing with pleas of the crown the sheriff's jurisdiction was abolished and was ultimately replaced by that of the justices or conservators of the peace. The sheriff then ceased to be a judge in criminal cases, but remained and still is in law responsible for the peace of his county, and is the officer for the execution of the law. The royal control over crime was effectively established by the itinerant justices sent regularly throughout the realm, who not only dealt with the ordinary proprietary and fiscal rights of the crown but also with the graver crimes (treason and felony), and ultimately were commissioned to deal with the less grave offences now classed as indigent misdemeanours. The change resulted from the strengthening of royal authority throughout England, which enabled the crown gradually to enlarge the pleas of the crown and to weaken and finally to supersede the criminal jurisdiction, notably of the sheriff, but also of prelates and lords in ecclesiastical and other manors and franchises. "In the early English laws and constitution there existed a national sovereignty and original criminal jurisdiction, but the ideas of legislative power and crime were very slowly developed." During the 14th century the criminal law was affected by the influence of the church, which introduced into it elements from the Canon and Mosaic laws, and also by the memory of the Roman empire and the renewed study of the Roman law, which enabled lawyers to draw a clearer distinction than had before been recognized between the criminal (dolus) and civil (culpa) aspect of wrongful acts. The Statute of Treasons (1351) is to a large extent an adumbration of Roman with feudal law; and to the same source is probably due the more careful analysis of the mental elements necessary to create criminal responsibility, summed up in the somewhat misleading expression *nemo reus est nisi mens sit rea*.

In the 14th century the justices of the peace and quarter sessions were established to deal with offences not sufficiently important for the king's judges, and from that time the course of criminal justice in England has run substantially on the same lines, with the single and temporary interruption caused by the court of star chamber.
The penal laws of modern states classify crimes somewhat differently, but in the main on the same general principles, dividing them into:—

1. Offences against the external and internal order and security of the state.

2. Offences against the administration of police and against public authority.

3. Acts injurious to the public in general.

4. Offences against the person (life, health, liberty and reputation), and conjugal and parental rights and duties.

5. Offences relating to property and contracts (including theft, fraud, forgery and malicious damage).

The terminology by which crimes are described by reference to their comparative gravity varies considerably. In many continental codes distinctions are drawn between crimes (Ger. Verbrechen; Norske forbrydelser; Span. crímenes; Ital. reato), delicts (Ger. Vergehen; Ital. delitti; Span. delitos), and contraventions (Ital. contraventioni; Span. faltas).

The classification adopted by English law is peculiar to itself, "treason," "felony" and "misdemeanour," with a tentative fourth class described as "summary offences." The particular distinctions between these three classes are dealt with under the titles "Treason," "Felony," and "Misdemeanour," &c. Here it is enough to say that the distinction is a result of history and is marked for abolition and reclassification. Treason and most felonies and some misdemeanours would under foreign codes fall under the head of crime. Misdemeanour, roughly but not exactly, corresponds to the French délit, and summary offence to contravention.

Elements of criminal responsibility.

In all systems of criminal law it is found necessary to determine the criterion of criminal responsibility, the mental elements of crime, the degrees of criminality and the point at which the line is to be drawn between intention and commission.

The full definition of every crime contains expressly or by implication a proposition as to a state of mind, and in all systems of criminal law, competent age, sanity and some degree of freedom from coercion, are assumed to be essential to criminality; and it is also generally recognized that an act does not fall within the sanction of the criminal law if done by pure accident or in an honest and reasonable belief in circumstances which if true would make it innocent; e.g. when a married person operates against the husband and reasonable but mistaken belief that the former spouse is dead. Honest and reasonable mistake of fact stands on the same footing as absence of the reasoning faculty, as in infants, or perverseness of that faculty, as in lunatics.

Besides the elements essential to constitute crime generally, particular mental elements, which may differ widely, are involved in the definition of particular crimes; and in the case of statutory offences adequately and carefully defined, the mental elements necessary to constitute the crime may be limited by the definition so as to make the prohibition of the law against a particular act absolute for all persons who are not infants or lunatics. As a general rule of English law, it is enough to prove that the acts alleged to constitute a crime were done by the accused, and to leave him to rebut the presumption that he intended the natural consequences of the acts by showing facts justifying or excusing him or otherwise making him not liable. Children are conclusively presumed to be incapable of crime up to seven years of age; and from seven to fourteen the presumption is against the capacity, but is not absolute.

Under the common law, insanity was an absolute answer to an accusation of crime. Since 1883, where insanity is proved to have existed at the date of the commission of the incriminated acts, the accused is found guilty of the acts but insane when he did them, and is relegated to a criminal lunatic asylum. There was also at common law a presumption that a married woman committing certain crimes in the presence of her husband did so under his coercion. But under modern decisions and practice the presumption has become feeble almost to inanition (R. v. Mary Baines, 1900, 69 L.J. Q.B. 681). Distinctions are also drawn between degrees of guilt or complicity.

English criminal law punishes attempts to commit crime if the attempt passes from the stage of resolution or intention to the stage of action, when the completion of the full offence is frustrated by something other than the will of the accused. Except in the case of attempt to commit murder, which is a felony, attempts to commit a crime are punished as misdemeanours. It also punishes the solicitation or incitement of others to commit crime, as a separate offence if the incitement fails, as the offence of being accessory before the fact or abettor if the offence is committed as a result of the incitement; and it punishes persons who, after a more serious crime—falsely—has been committed, do any act to shield the offender from justice. In the case of the crimes described as felonies the law distinguishes between principals in the first or second degree and accessories before or after the fact. In the case of misdemeanours the same punishment is incurred by the principal offenders, and by persons who are present aiding and abetting the commission of the offence, or who, though not present, counselled or procured the commission of the offence (see ACCESSORY).

Besides these degrees of crime there is one almost peculiar to English law known as conspiracy, i.e. an agreement to commit crime or to do illegal acts (including intercourse with the due consent of the parties, which is contrary to the law). It is punishable whether or not the conspiracy does not go beyond the stage of agreement. The exact nature of this form of crime and the propriety of abolishing it or limiting its scope have been the subject of much controversy, especially with reference to combinations by trade unions.

The English law does not, but most European laws do, allow the jury to reduce the penalty of an offence by finding in their verdict that the commission of the offence was attended by extenuating circumstances; but when the jury recommend to mercy a person whom they find guilty the judge may give effect to the recommendation or report it to the Home Office.

In systems of criminal law derived from England the forms of crime or degrees of complicity above stated reappear with or without modification, but as to conspiracy with a good deal of alteration. In the Indian penal code, for instance, conspiracy is limited to cases of treason (§ 121 A), and when it goes beyond agreement in the case of other offences it is merely a form of abetment or participation (§ 107).

The criminal law of England is not codified, but is composed of a large number of enactments resting on a basis of common law. A very large part is reduced to writing in statutes. The unwritten portion of the law includes (1) principles relating to the excuse or justification of acts or omissions which are prima facie criminal, (2) the definitions of many offences, e.g. murder, assault, theft, forgery, perjury, libel, riot, (3) parts of the law relating to procedure. The law is very rich in principles and rules embodied in judicial decisions and is extremely detailed and explicit, leaving to the judges very little latitude of interpretation or expression. So far as the legislature is concerned there is an absence of systematic arrangement. The definitions of particular crimes are still to be sought in the common law and the decisions of the judges. The Consolidation Acts of 1861 for the most part leave definitions as they stood, e.g. the Larceny Act 1861 does not define the crime of larceny. The consequence is that exact definitions are very difficult to frame, and the technical view of a crime sometimes includes more, sometimes less, than it ought. Thus the crime of murder, as settled by the existing law, would include offences of such very different moral gravity as killing a man and maiming a horse.

It is founded," said Sir J. Fitzjames Stephen, writing in 1863, "on the most liberal model of Código Penal of the 10th century; and the last century has seen a very great improvement of it, of which the most important of which are as old as Bracton. Upon this foundation there was built, principally in the course of the 18th century, an entire and irregular superstructure of acts of parliament, the enactments of which were for the most part intended to supply the deficiencies of the original system. These acts have been re-enacted twice over in the present generation—once between 1826 and 1832 and once in 1861; besides which they were all amended in 1837. Finally, every part of the whole system has been made the subject of judicial comments and constructions occasioned by particular cases, the great mass of which have arisen within the last fifty years." (View of the Criminal Law of England, by J. Fitzjames Stephen.)
In the time of Henry VIII. (1536, 28 Hen. VIII. c. 15) an act was passed stating that, as the admiral tried persons according to the course of civil law, they could not be convicted unless either they confessed or they or the witnesses were submitted to torture, and that therefore it was expedient to try the offences according to the course of the common law. Under that act a special commission of oyer and terminer was issued to try these offences at the Old Bailey, and English law was satisfied by permitting the indictment to state that the offence was committed on board a ship on the high seas, to wit in the county of Middlesex. Since 1861 these special commissions have been rendered unnecessary by the provision (contained in each of the Criminal Law Consolidation Acts of that year) that all offences committed on the high seas may be tried as if they had been committed in England. As regards offences on land, it was found necessary as early as the reign of Henry VIII. (1544) to provide for the trial in England of treasons and murders committed on land outside England. This was largely due to the constant presence in France of the king and many of his nobles and knights, but the aik of this statute had to be invoked in 1903 in the case of Lytton, for trial in South Africa.

The latest legislation on the subject is contained in sections 5, 6 and 7 of the Offences against the Person Act, 1861, by which it is provided that, if a person committed an offence and afterwards went into a foreign country, and if the act committed before his going into that country formed part of the same transaction by which he afterwards committed the offence, he shall not be exempted from punishment by reason of his flight. The law is extended by section 70 to the case of crimes committed on board ship within the admiralty jurisdiction. It has also been extended to the case of persons who had committed an offence abroad and who afterwards came within the territorial jurisdiction of this country, and it applies to the case of persons who were fled from justice in this country and fled into a foreign country.

Ofences committed on land outside England.

Misdemeanours committed by public officers in colonies.

An essential part of the criminal law is the punishment or sanction by which the state seeks to prevent or avenge offences. See also Criminology. Here it is enough to say that during the 19th century great changes have been made throughout the world in the modes of punishing crime. In England until early in the 19th century, punishments for crime were far less severe. The severity of the law was tempered by the rule as to benefit of clergy and by the rigid adherence of the judges (in favorem vitae) to the rules of correct pleading and proof, whereby the slightest error on the part of the prosecution led to an acquittal. Bentham pointed out that certainty of punishment was more effective than severity, that severe punishments induced juries to acquit criminals, and that thus the certainty of punishment was diminished. But his arguments and the eloquence of Sir Samuel Romilly produced no effect until after the reform of parliament in 1832, shortly after which statutes were passed abolishing the death sentence for all felonies where benefit of clergy existed. The severity of capital sentences had already been modified by the pardoning power of the crown.
which pardoned convicts under sentence of death on their consenting to be transported to convict settlements in the colonies. (See DEPORTATION.) For some years this was only done by the consent of the convict, who agreed to be transported if his death sentence was remitted, but in 1824, when a convict refused to give this consent, parliament authorized the crown to substitute transportation for a death sentence, and the same course was adopted in Ireland in 1851 when some treason-felonies refused commutation of their sentence to transportation.

The punishments now in use under the English law for indictable offences are:

1. Death, inflicted by hanging, with a provision that other modes of execution may be authorized by royal warrant in cases of high treason.
2. Penal servitude, which in 1853 was substituted for transportation to penal settlements outside the United Kingdom. The minimum term of penal servitude is three years (Penal Servitude Act 1851), and the sentence is carried out in a convict prison, in the United Kingdom, but there is still power to send the convicts out of the United Kingdom.
3. Imprisonment in a local prison, which must be without hard labour unless the statute specially authorizes a sentence of hard labour. At common law there is no limit to a term of imprisonment for misdemeanour; but for many offences (both felonies and misdemeanours) the term is limited by statute to two years, and in practice this limit is not exceeded for any offence. The treatment of prisoners is regulated by the prison acts and rules.
4. Police supervision, on conviction or indictment of felony and certain misdemeanours after a previous conviction of such offences. Prevention of Crimes Act, c. 112, §§ 8, 20.
5. Pecuniary fine, a punishment appropriate only to misdemeanours and never imposed for a felony except under statutory authority, e.g. manslaughter (Offences against the Person Act, § 3). The amount of the fine is in the discretion of the judge, subject to the directions of Magna Carta and the Bill of Rights and of any statute limiting the maximum for a particular offence.
6. Whipping was a common law punishment for misdemeanants of either sex. Under the present law the whipping of females is prohibited, and the punishment is not inflicted on males except in cases of assault on the person in which case the court has discretion to sentence to corporal punishment. However, the court may order the offender to be taken before a police magistrate and there charged with some minor assault or aggravated breach of the peace.
7. Recognizances (caution) to keep peace and be of good behaviour, i.e. a bond with or without sureties creating a debt to the crown not enforceable unless the conditions as to conduct therein made are broken. This bond may be taken from any misdemeanant, and, under statutory authority, from persons convicted of any felony (except murder) falling within the Criminal Law Consolidation Acts of 1861.
8. In the case of any offence which is not capital the court, if it is a first offence or if any other grounds for mercy appear, may simply bind the offender over to come up for judgment when required, intimating to him that if his conduct is good no further steps will be taken to punish him.

Except in the case of the death penalty, the court of trial has a discretion as to the quantum of a particular punishment, no minimum being fixed. In the case of offences punishable on summary conviction the maximum punishment is always fixed by statute. It consists of imprisonment with or without hard labour, or a fine of a limited amount, or both. The imprisonment in very few cases may exceed six months. If the maximum exceeds three months the accused must be informed that he has a right, if he so elects, to be tried by a jury.

Where power is given to deal summarily with offences which under ordinary circumstances would be tried on indictment, the punishments are as follows (Summary Jurisdiction Act 1879):

(a) In the case of adults pleading guilty, imprisonment not exceeding six months without the option of a fine.
(b) In the case of adults (consenting to be summarily tried), where the offence affects property not worth over forty shillings, imprisonment not over three months, or fine not exceeding 5£.
(c) In the case of young persons, between twelve and sixteen years, imprisonment not over three months, or fine not exceeding 1£.
(d) In the case of children under twelve, imprisonment not over one month, or fine not exceeding forty shillings.

If the offence is trifling, the accused may be discharged without punishment, and under the First Offenders Act (1887) the justices have a discretionary power to forgo punishment. The justices have also the power, under the Prevention of Crime Act 1908, in lieu of passing a sentence of penal servitude or imprisonment, to commit persons between the ages of sixteen and twenty-one to a Borstal institution, for a period of detention ranging from one to three years (see JUVENILE OFFENDERS).

In the criminal law of Europe the scale of punishments is on similar lines in most states, and is more elaborate than that of England, and less is left to the discretion of the court of trial. The following examples will indicate the kind of punishments awarded under the French penal code. Punishments are classified as (1) afflictive, (2) afflictive et infamant, (3) afflictive, travaux forcés à perpétuité ou à temp, détention, réclusion; (2) infamantes, viz. banishment and civil degradation; (3) peines en matière correctionnelle, viz. imprisonment in a house of correction (six days to five years), interdiction from certain civic rights, and fine. The punishments in no case have any effect to extinguish the civil claims of individuals who have suffered by the offender (arts. 6 and 53). Special provisions are made for récidivistes, police supervision and first offenders (Loi Béranger).

In the German code of 1872 the legal punishments are: (1) death; (2) penal servitude for life or for a term not exceeding fifteen years or less than one year; (3) imprisonment with labour for a term not exceeding five years or less than one day; (4) confinement in a fortress (terms same as for penal servitude but involving only withdrawal of freedom and supervision); (5) arrest for not more than six weeks nor less than one day; (6) fine (not less than three marks in the case of crimes or delicts nor one mark in case of petty offences). Sentence of imprisonment is not to exceed three years. In the event of non-payment of the fine the court may order the offender to be placed under police supervision for a term after release. In the case of a sentence of death or of penal servitude, the court may order forfeiture of civil privileges, and a condemnation to penal servitude permanently disqualifies for service in the army and public office (Code pt. 1, chap. 1, arts. 13-40).

Under the Italian code of 1889 (arts. 11-30) the punishments are (1) ergastolo (for life); (2) reclusione (from three days to twenty-four years), which involves hard labour and cellular confinement; (3) detenzione (like term), which involves labour and at night separate confinement; (4) confino (one month to three years), a form of banishment from the commune of origin or residence of the offender; (5a) fine (multa), from ten to one thousand lire; (5b) amende, from one to two thousand lire; (6) arrest (one day to two years); (7) interdiction from public office; (8) suspension from professional calling. Punishments (5b), (6) and (8) are applied only to contraventions, the others to crimes (delitti).

The Spanish law (Código Penal, title 3, chaps. 2 and 3) contains a general scale of punishments classified as afflictive, correctional, light and accessory. The first class begins with death and runs down through many forms of imprisonment to disqualification (inhabilización). The second includes forms of imprisonment, (presidio and prisión), and arrest, public censure and suspension from the exercise of certain offices or callings. The slight punishments are minor arrest and private censure. Offenders in any of the three classes may also be fined or put under recognizance (caución). The accessory punishments include payment of costs, degradation, civil interdiction.

In England indiscutible offences (i.e. offences which must be tried by a judge and jury) are thus dealt with:

1. Courts of assize (sitting under old commissions known as
commissions of assize, oyer and terminer, and general gaol delivery) are held twice or oftener in every year in each county and also in some large cities and boroughs. They are the lineal successors of the justices of eyre 1 of the middle ages; but they are now integral parts of the High Court of Justice. These courts can try any indictment offence presented by a grand jury for the district in which they sit.

2. For the counties of London and Middlesex and certain adjoining districts, a special court of assize known as the central criminal court sits monthly.

3. In all counties and many boroughs the justices of the peace sit quarterly or oftener under the commission of the peace to try the minor indictable offences. (See Quarter Sessions, Court of.)

4. The High Court of Justice in the king's bench division tries a few special offences in its original jurisdiction, and where justice requires may transfer indictments from other courts for trial before itself.

5. The court of criminal appeal has been instituted by the Criminal Appeal Act 1907; to it all persons convicted on indictment have a right of appeal. (See Appeal.)

The substantive law as to crime applied in England to all persons existing within the United Kingdom. Criminal procedure is the same for all subjects alike, except in the case of peers or peeresses charged with felony, who have the right of trial by their peers in the House of Lords if it be sitting, or in the court of the lord high steward.

There are in England no courts of a special character, such as exist in some foreign countries, for the determination of disputes between the governing classes themselves or with the governed classes, whether of a civil or criminal character. There are a few exceptional courts with criminal jurisdiction. The court of chivalry, which used to punish offences committed within military lines outside the kingdom, is obsolete. Special tribunals exist for trying naval or military offences committed by members of the navy and army, but those members are not exempt from being tried by the ordinary tribunals for offences against the ordinary law, as though they were civilians. The naval courts can be held only on board a ship, and can as a general rule try only persons entered on the books of a king's ship. The military courts can only try persons who are actually members of the army at the time, and their authority is annually renewed by parliament, in consequence of the jealousy still felt against the trial of any man except by the ordinary courts of law. Military and naval courts can try in any part of the world, and whenever the forces are in active service can try followers of the camp as if they were actual members of the forces. (See Military Law; Martial Law.)

The ecclesiastical courts, which were formerly very powerful in England, and punished persons for various offences, such as perjury, swearing, and sexual offences, have now almost fallen into disuse. Their authority over Protestant dissenters from the established church was taken away by statute; their authority over lay members of the Church of England has disappeared by disuse. Occasionally suits are instituted in them against the clergy for offences either against morality or against doctrine or ritual. In these cases their sentences are enforced by penalties, such as suspension, or deprivation of benefice, or by imprisonment; which has replaced the old punishment of excommunication.

A system of procedure, with the judicial machinery required to work it, may be created either by the direct legislative action of the supreme power or by custom and the action of the courts. Both at Rome and in England it was through usage and by the courts themselves that the earlier system was slowly moulded: both at Rome and in England it was direct legislation that established the later system. (See Bryce, Studies in History and Jurisprudence, 1901, ii. 334.)

The characteristics of English criminal procedure which most

1 i.e. Itinerant justices. From the Latin in itinere, on a journey.

distinguish it from the procedure of other countries are as follows:

1. It is litigious or accusatory and not inquisitorial (Stephen, Prel. View Cr. Law). It is for the prosecutor to prove by evidence the commission of the alleged offence. No power exists to interrogate the accused unless he consents to be sworn as a witness in his own defence, which since 1808 he may do. The right to cross-examine him even when he is so sworn is limited by law, with the object of excluding inquiry into his past character or into past offences not relevant to the particular charge on which he is being tried.

2. The forms of criminal pleading still in use are in substance framed on the lines of the old system of pleading at common law in civil cases, which was swept away by the judicature acts. Criminal pleadings have, however, one peculiarity. Indictments, being in form the presentment of a grand jury, could not be amended until provision for that purpose was made in 1851. (See Indictment.)

3. Criminal prosecutions are ordinarily undertaken by the individuals who have suffered by a crime. There is not in England, as in Scotland and all European countries, a public prosecutor specially concerned to deal with all prosecutions for crime. The result is that the prosecution of most ordinary crime is left to individual enterprise or the action of the local police force or the justices' clerk.

The attorney-general has always represented the crown in criminal matters, and in state prosecutions appears in person on behalf of the crown, and when he so appears has certain privileges as respects the reply to the prisoner's defence and the mode of trial. In the Prosecution of Offences Acts of 1879, 1884 and 1908 there is to be found the nucleus of a system of public prosecution such as obtains in other countries in case of crime. Under these acts the director of public prosecutions (up to 1908 an office conjoint with that of solicitor to the Treasury) acts under the attorney-general, but unless specially directed he only undertakes a limited number of prosecutions, e.g. for murder, coinage and serious crimes affecting the government.

4. Where an indictable offence is supposed to have been committed the accused is arrested, with or without the warrant of a justice, according to the nature of the offence, or is summoned a justice before him. On his appearance a preliminary inquiry is held for the purpose of ascertaining whether there is a prima facie case against him. The procedure is regulated by the Indictable Offences Act 1848, and is entirely different from the procedure for summary offences. It may be, though usually it is not, held in private; it is an inquiry and not a trial; the justices have to consider not whether the man is guilty, but whether there is such a prima facie case against him that he ought to be tried. If they think that there is, they commit him to prison to wait his trial, or require him to give security, with or without sureties, to the amount named by them, for appearing to take his trial. If they think the charge unsubstantial they discharge the accused at once. The prosecutor in cases of felony may if he likes go before the grand jury whether the case has or has not been the subject of a preliminary inquiry, but in the case of many misdemeanours it is obligatory first to have a preliminary inquiry, as a protection against vexatious indictments.

Whether there has or has not been a preliminary inquiry before a magistrate, no person can be tried for any of the graver crimes, treason or felony, except upon indictment found by a grand jury of the county or place where the offence is said to have been committed or by statute made cognizable. In olden days, and even now in theory, the grand jury inquire of their own knowledge, by the oath of good and lawful men of the neighbourhood, into the crime of the county, but in practice the charges against the accused persons are always first submitted to the proper officer of the court. The grand jurors are instructed as to their inquisition by a charge from the judge, as regards the indictments concerning which they are called upon to enquire whether there is a prima facie case to send them for trial to the petty jury. The
grand jury must consist of not less than twelve, nor more than twenty-three, good and lawful men of the county. But any person who prefers an indictment is entitled to have it presented to the grand jury. Officers of the court lay the indictments before the grand jury. The charges are then called bills, and if the grand jury considers that there is no prima facie case the foreman endorses the bill with the words "no true bill," and it is then presented to the judge. The jury are then said to have ignored the bill, and if the person charged is in custody he is released, but is liable to be indicted again on better evidence.

As a means of constitutional protection in times of monarchical aggression this practice had no doubt a great value, but in the present day, when few offenders are tried without a preliminary inquiry by justices, the functions of a grand jury are of secondary importance, and the jurors' time is perhaps needlessly occupied. The institution of the grand jury prevented the crown in the days of its great power from removing a person whom it wished to get rid of from among his neighbours, and placing him on trial in a strange place where the influence of the crown was greater.

This is still true to a certain extent, as great injustice may be caused to a man by removing him from his neighbours and trying him at a distance from his friends, and from the witnesses whom he might call for his defence. In Ireland, for instance, the greatest injustice might be done by removing an Orangeman from Belfast and trying him in a Roman Catholic county or vice versa. But it has its evils where the area from which the jurors are drawn is small, such as a town of a few thousand inhabitants. In that case a man charged, say, with fraud, may be protected by his friends from being properly punished for that fraud. But where justice requires, an order may be made for the trial of the offence in another county or at the central criminal court.

In many colonies the Scottish system has been adopted, by which the ordinary form of accusation is by indictment framed by the public prosecutor, and a grand jury is only impannelled in cases where an individual claims to prosecute an offence as to which the public officials decline to proceed. In England, criminal informations by the attorney-general, or by leave of the court without the intervention of a grand jury, are permitted in cases of misdemeanor, but are now rarely preferred.

If a coroner's jury, on inquiring into any sudden death, finds that murder or manslaughter has been committed, that finding has the same effect as an indictment by a grand jury, and the man charged may be tried by the petty jury accordingly. The law and procedure of the coroner's courts are now regulated by the Coroners' Act 1885. When there is a dead body of a person lying within the area of his jurisdiction, and there is reasonable cause to suspect that such person died a violent or unnatural death, or a sudden death of which the cause is unknown, or has died in prison, the coroner is entitled to hold an inquest, and if the verdict or inquisition finds murder or manslaughter, it is followed by trial in the same way as if the person accused had been indicted.

When an indictment is found by the grand jury (twelve at least must concur) the person charged is brought before the court, the indictment is read to him, he is asked whether he is guilty or not guilty. If he pleads guilty he is then sentenced by the court; if he pleads not guilty, a petty jury of twelve is formed from the panel or list of jurors who have been summoned by the sheriff to attend the court. He is tried by these jurors in open court. The common law method of trial of crimes by a jury of twelve, native to English law, has been in modern times transplanted to European countries. It was not the original form of trial, for it was preceded by wager of battle (which was not finally abolished till 1819); and by ordeal, which was suppressed as to criminal trials in 1215 in consequence of the decree of the Lateran Council (1215). The first was allowed only on an appeal by an individual accused; the second was resorted to on an accusation by public fame, which the accused was allowed to meet by submitting to the ordeal. It was after 1215 that trial by the jury of twelve (known as trial in pais) began to develop. At the outset the accused used to be asked whether he would be tried, and could not be directly compelled to plead to the charge or to accept trial by a jury; which led to the indirect pressure known as the peine forte et dure, which fell into disuse after the Revolution and was formally abolished in 1772. But it was not until 1827 that refusal to plead was treated as a plea of not guilty, entailing a trial by a jury, and some old-fashioned officials still ask the old question "How will you be tried?" to which the old answer was "By God and my country."

The original trial jury or inquest certainly acted on its own knowledge or inquiries without necessarily having evidence laid before it in court. The impartiality of the jurors was to some extent secured by the power of challenge. The exact time when the jury came into its present position is difficult accurately to define. On the trial before the petty jury the procedure and the rules of evidence differ in very few points from an ordinary civil case. The proceedings as already stated are accusatory. The prosecutor must begin to prove his case. Confessions (which are the object sought by French procedure) are regarded with some suspicion, and admissions alleged to have been made by the accused are not admitted unless it is clear that they were not extracted by inducements of a temporal nature held out by persons in authority over him. During the spring assizes of 1877 a prisoner was charged with having committed a murder twenty years before, and the counsel for the prosecution, with the consent of the judge, withdrew from the case because the only evidence, besides the prisoner's own confession, was that of persons who either had never known him personally or could not identify him. The accused may not be interrogated by the judge or the prosecuting counsel unless he consents to be sworn as a witness. In this respect the contrast between a criminal trial in England and a criminal trial in France is very striking. The interrogation and browbeating of the prisoner by the judge, consistent as it may be with the inquisitorial theory of their procedure, is strange to English lawyers, accustomed to see in every criminal trial a fair fight between the prisoner and the prosecution, and not a contest between the judge and the prisoner. The accused may, if he choose, be defended by counsel, and if poor may get legal aid at the public expense if the court certify for it. He is entitled to cross-examine the witnesses for the prosecution and to call witnesses in his defence. At the conclusion of the evidence and speeches the judge sums up to the jury both as to the facts and the law, and the jury by their verdict acquit or convict. Immediate discharge follows on acquittal; sentence by the jury of a corroboration of the indictment.

Justices of the peace may under many statutes convict in a summary manner (without the intervention of a jury) for offences of minor importance. The procedure for punishing summary offences is before two justices, or a stipendiary magistrate. This procedure must not be confused with the preliminary inquiry already mentioned before justices for an indictable offence, nor with the procedure before justices in relation to civil matters, such as the recovery of small sums of money. The proceeding begins either by the issue of a warrant for the arrest of the person charged, in which case a sworn information must be filed, or by a summons directing the person charged to appear on a certain day to answer the complaint made by the prosecutor. The justices hear the case in open court; the person charged can make his defence either in person or by his solicitor or counsel, he can cross-examine the witnesses for the prosecution, call his own witnesses, and address the justices in his defence. The justices, after hearing the case, either acquit or convict him, and in case of conviction award the sentence. If the sentence is a fine, and the fine is not paid, the person convicted is liable to be imprisoned for the term fixed by the justices, not exceeding a scale fixed by an act of 1879, the maximum of which is one month. The imprisonment may be with or without hard labour.

Of late years this summary jurisdiction of the justices has received very large extensions, and many offences which were...
The extension of the jurisdiction of the justices is open to the observation that it deprives a person charged of the protection of a jury, and also that it throws upon him, if convicted, and upon the prosecution if there is no conviction, the cost of the proceedings. The former objection is much mitigated by the enactment made in 1879, that a person liable on conviction to be sentenced to imprisonment for more than three months, or to a fine exceeding £100, can claim to be tried by a jury. But the objection as to the costs remains, and the payment of costs is often a very serious addition to the trivial fine; and it is anomalous that a person convicted of a trifling offence should bear the cost of the prosecution, while if he is convicted before a superior tribunal of the most serious offence he does not pay the costs.

In English law until 1807, where a criminal case had been tried by a jury the verdict of the jury of guilt or innocence was final and there was no appeal on the facts. Any considerable defect or informality in the procedure might be the subject of a writ of error. And if any question of law arose at the trial, the judge might, if he chose, reserve it for the opinion of the court for the consideration of crown cases reserved, by whom the conviction might be either quashed or confirmed.

By the Criminal Appeal Act 1907, a new court was established, to which any person convicted on indictment might appeal. (See Appeal.)

The duties of a prosecutor for crime in England are dealt with in the following manner. Prosecutions for high treason and the cognate offence known as treason-felony are at the expense of the state, which alone undertakes such prosecutions. In the case of all other felonies and of many misdemeanours the expense of the prosecution falls on the local rate. In the case of other misdemeanours the expense falls on the prosecutor. Where an offence is summarily prosecuted the costs are in the discretion of the court, which may order the accused to pay them, if convicted, or the prosecutor to pay on acquittal, or may leave the parties to pay their own expenses. On charges of felony and a few misdemeanours the court may order the accused person to pay the expenses of his prosecution in relief of the local rate. In a few cases, chiefly where the prosecution is vexatious, the court may order the prosecution to pay the expenses of the defence. The expenses of witnesses for the defence in any indicatable offence may be paid out of the local rate when they have been called at the preliminary inquiry; and where the court in the case of a poor prisoner has certified that he should have legal aid, the expenses of the defence may be charged to the local rate. The local rate upon which the expenses fall is usually that of the county or borough in which the offence was committed; but sometimes is that of the place where the offence is tried.

Between 1852 and 1888 parliament reimbursed to the local authorities the expense imposed on the local rate. In 1888 the proceeds of certain taxes were set aside and handed over to the local authorities as a set-off to the expense incurred in prosecutions. In one class of case, offences committed in the admiralty jurisdiction, i.e. outside England, the treasury directly reimburses to the local authorities the expense incurred.

Under most, if not all, European codes, the state pays for the prosecution, subject to reimbursement by the accused, if the court so orders.

The English system of criminal procedure is the basis of that of most of the states which form the United States of America, and, with few exceptions, of the procedure throughout the British empire.

The French penal code and code of criminal procedure are substantially the model of all systems of continental criminal law. They were promulgated in 1811 by Napoleon I., and although he called in the aid of the greatest French jurists, he guided, and occasionally even revised, their labours. The French codes have been improved upon by later European codes, and more especially by the Italian penal code. All European codes have an opening chapter where the general principles of criminal law in its practical application are enunciated, such as, for instance, the rules that—(1) no person is liable to punishment for any act not expressly declared to be an offence; (2) no person can be punished for an act which by virtue of a subsequent law is declared not to be an offence; (3) whoever commits an offence within the kingdom is tried and punished according to the criminal law of the kingdom, and by the tribunals created for the administration of justice, to the exclusion of special tribunals created for temporary purposes. This rule really lays down that no citizen can be deprived of his own judges when he is accused of a criminal offence. (4) A citizen, although he may have been tried in a foreign country for an offence committed within the kingdom, can be retried according to the law of the kingdom. (5) Extradition only applies to foreigners, not to citizens. The preliminary chapter is followed by the classification of offences according to the importance of the punishments the law assigns to them. The lowest degree of offence is denominated "contravention." It applies mainly to the petty offences, or to infractions of police regulations, and can be punished by fine or by imprisonment under a week, or by both fine and imprisonment, limited to a week. Next comes the "délit," which includes all offences punished by imprisonment over a week and under five years. Then, finally, we arrive at the "crime," the highest form of offence in French criminal law. It includes all offences subject to a more severe sentence than the punishment assigned to a délitr. All cases are held to be crimes where death, life-imprisonment with or without hard labour, deportation out of the kingdom, detention or seclusion in a fortress or other expressly assigned place, are the punishments mentioned by the law. A certain number of explanatory definitions follow, of which the most important concern attempts to commit offences, and in "crimes" they are punishable if the execution of the attempt was only prevented by circumstances beyond the will of the offender, whilst in "délit" an attempt is not punishable as an offence unless the law specially provides that it should be punished. As regards "contraventions," attempts not carried out are not held to be offences at all. Accomplices are generally subject to the same punishment as the principal. Old offenders (récidivistes) are subject to severer punishments. The usual exceptions as regards responsibility for crime, such as madness and extreme youth and force majeure, are to be found in all codes. The excuse of youth extends to all offenders under the age of sixteen, when the tribunal decides whether the offender has acted without "discernment," and acquits where the discernment is not found, whilst one-half of the usual punishment is inflicted where discernment is found.

Foreign codes differ from the English law in allowing the injured party to claim damages in the criminal suit, appearing as partie civile. On another question there is a wide divergence on the continent of Europe from English law. According to the law of England an appeal in criminal law (with few exceptions created by statute). An offender is always liable to punishment whatever time may have elapsed since the committal of the offence. On the continent of Europe the limitation of a judgment and sentence for a crime is twenty years; five years for a délitr, and for a contravention two years. No proceedings can be taken as regards a crime after a lapse of ten years, whilst as regards a délitr the limit is three years, and two years for a contravention.

There are three main differences between English criminal procedure and European criminal procedure.

1. A criminal prosecution directed on European criminal procedure at once passes into the hands of the state as an infringement of law which must be repressed, on the ground that the whole community bases its security on obedience to law. In England the repression of all minor crime is left to the injured party.

2. In England every criminal trial from beginning to end is, and has always been, public. Preliminary inquiries into an
CRIMINAL LAW

indicible offence may be, but rarely if ever are, conducted in private. On the continent of Europe, with rare exceptions, all preliminary proceedings on a criminal charge are secret. Outside English-speaking countries this secret investigation continues more or less. But of the two systems, accusatory or inquisitorial—the first meaning the right of the accused to defend himself, the second meaning the right of the state to examine any legal offence in private in order to ensure the safety of society,—the accusatory is gaining ground in every country. In English-speaking countries it is an established law that an accused person should have the right of publicity of the proceedings and the right to defend himself by counsel and by witnesses. In Europe the inquisitorial system is gradually being abandoned. Perhaps the best code of criminal procedure in Europe is that promulgated in Austria in 1873. It followed a fundamental law of the Empire which laid down inter alia that all legal proceedings, civil or criminal, should be oral and public, and that the accusatory system in criminal cases should be adopted. Germany followed this example. Italy, Holland, Switzerland and Spain have followed Austria and Germany as regards the preliminary investigation. It has also been adopted by Belgium. In those countries the accused are entitled, after having been informed of the nature of the charge, to appear before a judge for the preliminary examination. He has then the right of being heard and of examining witnesses. The fundamental right of the accused to be heard has been undermined by the introduction of an investigation by the parquet. Thus, as in England, the proceedings are conducted by the parquet. The parquet is the juge d'instruction, who corresponds to the English magistrate, and is the formidable personage in the whole system of French criminal law. He can detain and accuse a person in prison, can send for him at any time and ask him such questions as he pleases.

After the first examination the prisoner is entitled, in most European countries, to the assistance of counsel, but the powers of counsel are so limited that the juge d'instruction has a complete discretionary power regarding the investigation of the case. The natural consequence of this procedure is that the preliminary investigation really decides the ultimate result, and the final trial becomes more or less a solemn form.

The criminal law of Ireland is to a great extent the same as that of England, resting on the same common law and on statutes which extend to both countries or are in almost the same terms, and is administered by courts of assize and quarter sessions, and by justices, as in England. In a few instances statutes passed for England or Great Britain before the Union have not been extended to Ireland, or statutes passed by the Irish parliament before the Union or by the British parliament since the Union create offences not known in English law. In Ireland the system of prosecution is nominally the same as in England, but in practice almost all prosecutions are instituted and conducted under the direction of the attorney-general for Ireland, who is a member of the government of the day, and so responsible to parliament, as in the case of the lord advocate. In Ireland, owing to the police being a centralized force, under the management of commissioners residing in Dublin, any prosecution which in England might be conducted by the local police, would in Ireland be conducted under the direction of the chief of the police in Dublin, who is necessarily in close communication with and under the control of the attorney-general.

In Scotland hardly any crimes are constituted by statute law, the common law being to the effect that if a judge will direct any act to be a crime, and a jury will convict, that act is a crime. This great elasticity of the common law to include every sort of new crime which might arise was in times past very dangerous to political liberty, as it greatly enlarged the power of the crown to oppress political opponents, but in modern days it has its convenience in facilitating the punishment of persons committing crimes the punishment of which in England a new act of parliament may be necessary. Criminal procedure in Scotland is regulated by an act of 1857 which greatly simplified indictments and proceedings. The prosecution of crime is in the hands of public officers, procurators fiscal, under the control of the lord advocate. Private prosecutions are possible, but rare. Except in the case of the law of treason, imported from England at the Union, no grand jury is required, and the indictments are filed by the public officer.

The criminal law of England forms the basis of the criminal law of all British possessions abroad, with a few exceptions, e.g. the Channel Islands (still subject to the custom of Normandy) and the anomalous case of Cyprus, where Mahommadan law is to some extent in force. As to India, see infra.

In many British colonies the criminal law has been codified or at the least consolidated. Criminal code have been passed in Canada, New Zealand (1833), New South Wales (1836) and Australia (1901). Many crown colonies have codes framed on the model prepared by the late Sir R. S. Wright for Jamaica and revised in 1901, and in British Guiana opportunity was taken (in 1893) to abolish the remnants of Roman-Dutch criminal law.

The criminal law of South Africa, which is based on the Roman-Dutch law, including the Constitutio Criminalis Carolina (1532), is not codified. In the Transvaal and Orange River colonies codes of criminal procedure are in force, drawn mainly from the common and statute law of the Cape Colony with the addition of provisions borrowed from English and colonial legislation.

In Mauritius the criminal law is comprised in a penal code of 1838 and a procedure code of 1853, which, with the incorporated amendments, are to be found in the Revised Laws of Mauritius.
CRIMINAL LAW

(1903–1904), ii. 466 et seq. The penal code is based on the Code Napoleon.

"Criminal law has everywhere grown out of custom, and has in all civilized states been largely dealt with by direct legislation.

Codification.

In most civilized states (including Japan) it has been codified by statute, to the general satisfaction of the people; and the conscious success of the Indian penal code shows that English criminal law is susceptible of being so treated " (Bryce, Studies, ii. 34).

The expediency, if not the necessity, of codifying the criminal law of England has long been apparent. The writings of Bentham drew attention to many of its substantial defects, and the efforts of Romilly and Mackintosh led to certain improvements embodied in what are known as Peel's Acts (1826 to 1832). In 1833, at the instance of Lord Chancellor Brougham, a royal commission was appointed to deal with the criminal law. The nature of the instructions indicate the crudity of the ideas then ruling as to codification. The commission was directed to digest into one statute all enactments touching crimes and the punishment thereof, and into another statute the provisions of the common unwritten law touching the same. The commission was renewed in 1836 and 1837, and in 1843 a second commission was appointed. Numerous and voluminous reports were published, including (1848) a bill for consolidating and amending the law as to crimes and punishments, and (1849) a bill for criminal procedure, indicating that the commissioners had in the meantime learned the distinction between substantive and adjective law. Lord Brougham in 1848 unsuccessfully introduced the first bill, and in the end the only fruit of the reports has been certain amendments of procedure in 1851 and the passing of the seven Criminal Law Consolidation Acts of 1851, which deal with the statute law as to theft, forgery, malicious injuries to property, coinage offences and offences against the person. The reports, however, proved of value in the revision of Macaulay's draft of the Indian penal code, and the work of the Supreme Law Committee, which has relieved the statute book of much dead matter. On his return from India, impressed by the success of the Indian penal code, Sir J. Stephen made a strong effort to obtain codification. In 1857, at the instance of Lord Cairns, he prepared a draft code (based on his well-known Digest of the Criminal Law), which was laid before parliament and then submitted to judicial criticism and revision. As a result of this revision a code bill was introduced in 1880; but a dissolution intervened and no serious effort was then made. The obstacle in the way is not lack of reports or digests on which to frame a code, but the incapacity of parliament to do the work itself, and its unwillingness to trust the work to other hands.

The Indian penal code and criminal procedure code, by their history, their form, and the extent and diversity of the races and peoples to which they apply, are perhaps the most important codes in the whole world. While the Indian Penal Code was prepared, the British-American system of crime law was developed, as described in the preceding chapter. In the Indian case, the English code was revised in 1861, and an amended version was published in 1862. It was then re-enacted with amendments in 1872 (Act X.), 1882 (Act X.) and 1898 (Act X.).

The results of India's penal law are as follows: The code is based on the Roman law of crime, though it is revised as necessary to meet the exigencies of any country. It opens with a chapter of general explanations, and interpretations of the terms used throughout the code. It then describes the various punishments to which offenders are liable; follows with a list of the exceptions regarding criminal responsibility under which a person is liable to be punished is exempted from the penal consequences of his act, such as offences committed by children, by accident or misfortune without any criminal intention, offences committed by lunatics, offences committed in the exercise of the right of private defence. It may be worth while to add, as an innovation on English law, that an act which results in harm so slight that no person of ordinary sense and temper would complain of such harm is not considered an offence under the code. Then follows a chapter on abetment, in other words, the instigation of a person to do a wrongful act. The next chapters deal with offences against the public, including the state, the army and navy, public tranquillity, public servants, contempts of the lawful authority of public servants, perjury; offences relating to coin and government stamps, to weights and measures; offences affecting the public health, safety, convenience, decency and morals; offences relating to religion; and offences relating to the human body. The latter is divided into two sections, one dealing with the infliction of any hurt. The code then passes on to offences against property; offences relating to forgery, including trade marks, criminal breach of contracts for service; offences relating to marriage, defamation, criminal intimidation, insult and annoyance. Under this last head is included an attempt to cause a person to do anything which that person is not legally bound to do, by inducing him to believe that he would otherwise become subject to Divine displeasure. The last chapter deals with attempts to commit offences punishable by the code with transportation or imprisonment, and the punishment is limited to one-half of the longest term provided for the offence had it been carried out.

One peculiarity of the Penal Code which has proved eminently successful lies in the system of illustration of the offence declared in every section by a brief statement of some concrete case. For instance, as illustration of the offence of an attempt to commit an offence, the following examples are given:

I. "A makes an attempt to steal some jewels by breaking open a box, and finds on opening the box there is no jewel in it. He has done an act towards the commission of theft, and therefore is guilty under this section.

II. A makes an attempt to pick the pocket of Z. by thrusting..."
of 1768 of Maximilian, revised in 1861, and the Prussian code of 1780, have been superseded by the German penal code of 1872.

The most important of the continental criminal codes are those of France, the Code Pénal (1810) and the Code d'Instruction Criminelle (1860)—the work of Napoleon the Great and his advisers, which profoundly incorporate much of the Roman law. The Belgian codes (1867), and the Dutch penal code (1880), closely follow the French model. In Spain the penal code dates from 1780, the procedure code from 1886. The Spanish American republics for the most part also have codes. Portugal has a penal code (1852). In Italy the procedure code and the penal code, perhaps the completest yet framed, are of 1890. The Swedish code dates from 1864. The Norwegian code was passed in May 1902, and came into force in 1905. Japan has a code based on a study of European and American models; and Switzerland is framing a federal criminal code.

In the United States no federal criminal code is possible; but most states, following the lead of Louisiana, have digested their criminal law and procedure more or less effectually into penal codes. (W. F. C.)

CRIMINOLOGY, the name given to a new branch of social science, devoted to the discussion of the genesis of crime (q.v.), which has received much attention in recent years. The expression is one of modern coinage, and originated with the speculative theories first advanced by the school of sociologists which had the Italian savant, Professor Lombrasso, at its head. He discovered or was supposed to have discovered a criminal type, the "instinctive" or "born" criminal, a creature who had come into the world predestined to evil deeds, and who could be surely recognized by certain stigmata, certain facial, physical, even moral birthmarks, the possession of which, presumably ineradicable, foredoomed him to the commission of crime. Dr Lombrasso, in his ingenious work L'Uomo delinquente, found many attentive and appreciative, not to say bigoted followers. Large numbers of dissentients exist, however, and the conclusions of the Italian school have been warmly contested and on very plausible grounds. If the doctrines be fully accepted the whole theory of free-will breaks down, and we are faced with the paradox that we have no right to punish an irresponsible being who is impelled to crime by congenital causes, entirely beyond his control. The "instinctive" criminal, under this reasoning, must be classed with the lunatic whom we cannot justly, and practically never do, punish. There are other points on which proof of the existence of the criminal type fails absolutely. The whole theory illustrates a modern phase of psychological doctrine, and the subject has exercised such a potent effect on modern thought that the claims and pretensions of the Lombrasso school must be examined and disposed of.

The alleged discovery of the "born-criminal" as a separate and distinct genus of the human species was first published by Dr Lombrasso in 1876 as the result of long continued investigation and examination of a number of imprisoned criminals. The personality of this human monster was to be recognized by certain inherent moral and physical traits, not all displayed by the same individual but generally appearing in conjunction and then constituting the type. These traits have been defined as follows:--various brain and cerebral anomalies; receding foreheads; massive jaws, prognathous chins; skulls without symmetry; ears long, large and projecting (the ear ad anseus); nose rectilinear, wrinkles strongly marked, even in the young and in both sexes, hair abundant on the head, scanty on the cheeks and chin; eyes feline, fixed, cold, glassy, fereocious; bad repellent faces. Much stress is laid upon the physiognomy, and it is said that it is independent of nationality; two natives of the same country do not so nearly resemble each other as two criminals of different countries. Other peculiarities are:--great width of the extended arms (l'envergure of the French), extraordinary ape-like agility; left-handedness as well as ambi-dexterism; obtuse sense of smell, taste and sometimes of hearing, although the eyesight is superior to that of normal people. "In general," to quote Lombrasso, "the born criminal has projecting ears, thick
hair and thin beard, projecting frontal eminences, enormous jaws, a square and protruding chin, large cheek bones and frequent gesticulation.” So much for the anatomical and physiological peculiarities of the criminal. There remain the psychological or mental characteristics, so far as they have been observed. Moral insensibility is attributed to him, a dull conscience that never pricks and a general freedom from remorse. He is said to be generally lacking in intelligence, hence his stupidity, the want of proper precautions, both before and after an offence, which leads so often to his detection and capture. His vanity is strongly marked and shown in the pride taken in infamous achievements rather than personal appearance.

No sooner was this new theory made public than the very existence of the supposed type was questioned and more evidence demanded. A French savant declared that Lombroso’s portraits were very similar to the photographs of his friends. Save for the dirt, the recklessness, the weariness and the misery so often seen on it, the face of the criminal does not differ from that of an honest man. It was pointed out that if certain traits denoted the criminal, the converse should be seen in the honest man. A pertinent objection was that the deductions had been made from insufficient premises. The criminologists had worked upon a comparatively small number of criminals, and yet their discoveries applicable to the mass, the facts were collected from too small an area; hence no definite conclusions could be based upon them.

Moreover, the criminologists were by no means unanimous. They differed amongst themselves and often contradicted one another as to the characteristics exhibited.

The controversy was long maintained. Many eminent persons have been arrayed on either side. In Italy Lombroso was supported by Colajanni, Ferri, Garofalo; in France by J. A. Lacassagne. In Germany Lombroso has found few followers; Dr Naècke of Hubertusburg near Leipzig, one of the most eminent of German aliens, declined to admit there was any special animal type. Van Hamel of Amsterdam gives only a qualified approval. In England it stands generally condemned, because it gives no importance to circumstance and passing temptation, or to domestic or social environment, as affecting the causation of crime. Dr Nicholson of Broadmoor has said that “if the criminal is such by predestination, heredity or accidental flaws or anomalies in brain or physical structure, he is fit for good and all; no cure is possible, all education and processes for his betterment, education, training and disciplinary treatment are in vain.” No weight can then be attached to evil example, or unfavourable social surroundings, in moulding and forming character, particularly during the more plastic periods of childhood and youth.

The pertinent question remains, has the study and development of criminology served any useful purpose? Little perhaps can come of it in its restricted sense, but it has taken a wider meaning and embraces larger researches. It has inquired into the sources and causes of crime, it has collected criminal statistics and deduced valuable lessons from them, it has sought and obtained guidance in the best methods of prevention, repression, and forms of procedure. The champions of law and order have been greatly aided by the criminologist in carrying on the continual combat with crime, and in dealing with the most complicated of social phenomena. The new science has, in fact, by accumulating a number of curious details, in recording the psychology, the secret desires, the springs of the criminal’s nefarious actions, his corrigibility or the reverse, prepared the way to his sociological explanation.” (Tarde). Thanks to the labours of the criminologist we are moving steadily forward to a future improved treatment of the criminal, and may thus arrive at the increased morality and greater safety of society. Very appreciable advance has been made in the increased attention paid to juvenile and adult crime, the acceptance of the theory, now well established, that there is an especially criminal age, a period when the moral fibre is weaker and more yielding to temptation to crime, when happily human nature is more malleable and susceptible to improvement and reform.

The study of criminology has, however, gone far to satisfy us that the true genesis of crime is not to be sought in the anatomical anomalies of individuals, or in the fact that there are people who under “any social conditions whatever and of any nationality at no matter what epoch, would have undoubtedly become murderers and thieves.” On the contrary it may be safely assumed that many such would have done no wrong if they had, e.g., been born rich, had been free from the pressing needs that drove them into crime, and had escaped the evil influences of their surroundings. The criminologists have strengthened the hands of administrators, have emphasized the paramount importance of child-rescue and judicious direction of adults, have held the balance between penal methods, advocating the moralizing effect of open-air labour as opposed to prolonged isolation, and have insisted upon the desirability of indefinite detention for all who have obstinately determined to wage perpetual war against society by the persistent perpetration of crime.

CRIMMITZSCHAU, or CRIMMITZSCH, a town of Germany, in the kingdom of Saxony, on the Pleisse and the main Leipzig-Hof railway, 7 m. N.W. from Zwickau. Pop. (1900) 22,845.

The most important industries of the town are the manufacture of buckskin, the spinning of carded yarn and vicuna-wool, and the processes of dyeing, finishing and wool-spinning connected with these. Among other manufactures are brushes, boilers and the like, machinery, metal ware generally, the cases and other parts of watches. The town has a modern school (Realschule), a commercial school, and technical schools for weaving and finishing.

CRIMP (possibly connected with “crimp,” to draw together, or fold in parallel, in the sense of “confine”); the primary meaning, however, seems to be that of “agent,” and the word may be a distinct one, of which the origin is lost), an agent for the supplying of soldiers and sailors, by kidnapping, drugging, decaying or other illegal means. Crimps were formerly regularly employed in the days of impressment (q.v.). Now the term is used, first of any one who engages to supply merchant seamen without a licence from the Board of Trade, and is not either the owner, master or mate of the ship, or is not bona fide the servant, and in the constant employment of the owner, or is not a superintendent (Merchant Shipping Act 1804, § 111); and, with a wide application, of the extortionate lodging or boarding-house keepers, who are generally in league with the “crimp” proper.

Sections 212 to 219 inclusive of the above act provide for the protection of merchant seamen in the United Kingdom from impostion. Local authorities at seaports have power to make by-laws for the licensing and regulating of lodging-houses for sailors, and to inflict penalties for the infringement thereof. If this power be not exercised, the Board of Trade may do so. Penalties are also imposed by the act for overcharging by lodging-house keepers, for detaining of seamen’s effects, and for soliciting. Unauthorized persons are prohibited from boarding a ship in port without leave. The Board of Trade officer at a port may provide money for sending a seaman to his home on discharge, and may forward his wages after deducting the expenses. Facilities are also given for having wages sent home from foreign ports at a small charge. These provisions have practically killed “crimping” in the United Kingdom. In the ports of the United States of America crimping was long prevalent, especially on the Pacific coast, and its prevention was very difficult, but state regulations as to the licensing of boarding-houses, and the limitation of the amount of so-called “blood-money” paid...
by masters of vessels to the suppliers of crews to ships denuded by desertions, have reduced the above materially.

The term “to shanghai” is used of a more serious offence, literally meaning “to ship to Shanghai,” in China, it is applied to the practice of drugging or rendering unconscious by violence or other means of persons, whether sailors or not, and shipping them to distant ports, in order fraudulently to obtain money in advance of wages, or for the sake of the premium paid for supplying crews.

Crimson, the name of a strong, bright red colour tinged to a greater or less degree with purple. It is the colour of the dye produced from the dried bodies of the cochineal insect (Coccus cacti). The word, in its earlier forms cressen, crymson, also cramosyn, cf. “cramoisy,” the name of a red cloth, is adapted from the Med. Lat. cressenus for hermesinus or carmesinus, the dye produced from the insect Kermiss (Coccus ilicis), Arab.quirmis, which Skect (Etym. Diet., 1898) connects with the Sanskrit krami, cognate with Lat. vermis and Eng. “worm.” From the Lat. carminius, a shortened form of carmesinus, comes “carmine” (q.v.).

Crimagoras, of Mytilene, Greek epigrammatist, flourished during the reign of Augustus (Strabo xii. p. 77). A number of epigrams appear under his name in the Greek Anthology. From inscriptions discovered at Mytilene, he appears to have been one of the ambassadors sent from that city to Rome in 45 and 26 B.C.

The epigrams have been edited by M. Rubensohn (1888).

Crinoline (a Fr. word formed of the Lat. crinis, hair, and linum, thread), a stiffening material made of horse-hair and cotton or linen thread. Substitutes for this, such as the straw-like material used in making hat shapes, are also known by the same name. From the use of the material to expand ladies’ skirts the term was applied, during the third quarter of the 19th century, when the fashion of wearing greatly expanded skirts was at its height, to the whalebone and steel hoops employed to support the skirts thus worn (see costume). The term is also used of structures resembling these articles, especially of the framework of booms, spars and netting forming a protection for a warship against torpedo attack.

Cirnum, a genus (nat. ord. Amaryllidaceae) of bulbous plants with rather broad leaves and a solid leafless stem, bearing a cluster of handsome white or red funnel-shaped flowers. There are over forty species, more or less owing to the wide distribution of the genus different methods are adopted to distinguish the different species. Some require the hot, moist temperature of a stove; such are C. ambela, a native of Sumatra, C. amoebe (India), C. Balfourii (Soozota), C. giganteum (West tropical Africa), C. Kirkii (Zanzibar), C. latifolium (India), C. seynianum (tropical Asia and Africa), and others. Others thrive in a greenhouse; such as C. asiaticum, a widely distributed plant in the sea-coast of tropical Asia, C. capense and C. longiflorum, from the Cape, and C. Macowanii and C. Moorei from Natal. C. asiaticum, C. capense and C. Macowanii will also thrive in sheltered positions in the garden.

Ciriobolium, the sacrifice of a ram in the cult of Attis and the Great Mother. It seems to have been a special ceremony instituted after the rise, and on the analogy of the taurobolium (q.v.), which was performed in honour of the Great Mother, for the purpose of giving fuller recognition to Attis in the duality which he formed with the Mother. There is no evidence of its existence either in Asia or in Italy before the taurobolium came into existence (after c. 300 B.C.). When the ciriobolium was performed in conjunction with the taurobolium, the altar was almost invariably inscribed to both the Mother and Attis, while the inscription was to the Mother alone when the taurobolium only was performed. The celebration of the ciriobolium was widespread, and its importance such that it was sometimes performed in place of the taurobolium (Corp. Inscri. Lat. vi. 595, 506). The details and effect of the ceremony were no doubt similar to those of the taurobolium.

Cripplet Creek, a city and the county-seat of Tellur county, almost at the geographical centre of Colorado, U.S.A., one of the phenomenal mining camps of the West. Pop. (1900) 10,147 (1408 foreign-born); (1910) 6206. The city is served by three railways—the Colorado Springs & Cripple Creek District (a branch of the Colorado & Southern), the Midland Terminal (which connects at Divid, 30 m. distant by rail, with the Colorado Midland), and the Florence & Cripple Creek. Cripple Creek is situated on a mountain slope in a pocket amid the ranges, about 9600 ft. above the sea at the head of the stream after which it is named. The municipal water-supply is drawn from Pike’s Peak, 10 m. distant. The interest of the city is in its extraordinary mines and their history. Cripple Creek’s site was frequently prospected after 1860, and “colours” and gold “float” were always found, but not until February 1891 was the source discovered. Cripple Creek was at that time a cattle range. In 1891 the output of gold in the district was valued at $449, in 1892 at $583,010, and in the next three years at $2,010,367, $2,968,702 and $6,879,137 respectively. From 1891 to 1906 the total production of gold was valued at $68,584,331; in 1905 the product of gold was valued at $13,411,724, the total for the whole state being valued at $25,029,975; in 1906 the output for the district was valued at $14,725,245, out of $23,216,629 for the entire state. The development of the industry into a great mine has been something more like a substantial city, and was marvellously rapid. The first railway was completed in 1894. In the same year a great strike—one of the most famous in American industrial history—threatened civil war, temporarily closed the mines; in 1896 fire almost destroyed the city; in 1903–1904 a second strike, lasting more than a year and greater than the first, occurred. The first strike, which was for an eight-hour day and $3.00 wage, was won by the miners. The second, for the recognition outright of the union organization of the miners, secured only a reaffirmation of the former conditions. The ores are almost exclusively gold, tellurides being the most characteristic form, and occur in fissure veins. Outcroppings were very rare, as the veins were covered with loose wash, and this accounted for the late opening of the field. The field covers a district about 8×10 m. Some peculiarities of the ores have required the use of new methods in their treatment, and in general the development of mining methods and machinery is of a wonderful character. The whole surrounding country is studded with miles of tunnels and shafts, and the hillsides are dotted everywhere everywhere with enormous dumps. The most famous mines have been the “Independence” (1891) and the “Portland” (1892). The latter had in 1904 more than 25 m. of workings above the 1100-ft. level. In 1905 the El Paso drain was completed, to unwater the western half of the field to the 880-ft. level, greatly increasing many mine values and outputs; in 1906 the work of drainage was again taken up, and work on a long bore was begun in May 1907. There are smelters and cyanide extractors in the district, but the bulk of the ore product is shipped to other places for treatment. Among the towns around Cripple Creek in the same mining district is Victor, pop. (1910) 3162, incorporated in 1894, chartered as a city in 1898.

See W. Lindgren and P. L. Ransome, Geology and Gold Deposits of the Cripple Creek District, Colorado, with maps (Washington, 1901), being Professional Paper No. 54 of the United States Geological Survey; and Benjamin McKie Rastall, The Labor History of the Cripple Creek District; A Study in Industrial Evolution (Madison, Wis., 1908), a full account of the strikes of 1894 and of 1903–1904.

Crira, or Crissa, in ancient geography, one of the oldest cities of Greece, situated on Phocis, on one of the spurs of Parnassus. Its name occurs both in the Iliad and in the Homeric hymn, where it is described as a powerful place, with a rich and fertile territory, reaching to the sea, and including within its limits the sanctuary of Pytho. As the town of Delphi grew up around the shrine, and the seaport of Cirra arose on the Crisian Gulf, Cirra gradually lost much of its importance. By the ancients themselves the name of Cirra was so often substituted for that of Cirra, that it soon became doubtful whether
these names indicated the same city or not. The question was practically settled by the investigations of H. N. Ulrichs. From his position Cirha commanded the approach to Delphi, and its inhabitants became obnoxious to the Greeks from the heavy tolls which they exacted from the devotees who thronged to the shrine. The Amphictyonic Council declared war (the first Sacred War) against the Crisaeans in 595 B.C., and having taken the town, razed it to the ground, and consecrated its territory to the temple at Delphi. The plunder of the town was sold to defray the expenses of the Pythian games. In 339 the people of Amphissa began to rebuild the town of Cirha and to cultivate the plain. This act brought on the second Sacred War, the conduct of which was entrusted by the Amphictyons to Philip of Macedon, who took Amphissa (mod. Salona) in the following year. The ruins of Crisa may be still seen where the ravine of the Pleistus joins the plain; its name is probably preserved by the modern Chryso.

(E. Gr.)

CRISPI, FRANCESCO (1819–1901), Italian statesman, was born at Ribera in Sicily on the 4th of October 1819. In 1846 he established himself as advocate at Naples. On the outbreak of the rebellion at Palermo (January 12, 1848) he hastened to the island and took an active part in guiding the insurrection. Upon the restoration of the Bourbon government (May 15, 1849) he was excluded from the amnesty and compelled to flee to Piedmont. Here he unsuccessfully applied for a situation as communal secretary of Verolengo, and eked out a penurious existence by journalism. Implicated in the Mazzinian conspiracy at Milan (February 6, 1853), he was expelled from Piedmont, and obliged to take refuge at Malta, whence he fled to Paris. Expelled from France, he joined Mazzini in London, and continued to conspire for the redemption of Italy. On the 11th of June 1859 he returned to Italy after publishing a letter repudiating the aggendizement of Piedmont, and proclaiming himself a republican and a partisan of national unity. Twice in that year he won the round of the Sicilian cities in disguise, and prepared the insurrectionary movement of 1860.

Upon his return to Genoa he organized, with Bertani, Bixio, Medici and Garibaldi, the expedition of the Thousand, and overcoming by a stratagem the hesitation of Garibaldi, secured the departure of the expedition at Palermo (January 12, 1860) he emigrated to Marsala on the 11th, Crispi on the 13th, at Selami, he raised the proclamation whereby Garibaldi assumed the dictatorship of Sicily, with the programme: “Italy and Victor Emmanuel.” After the fall of Palermo, Crispi was appointed minister of the interior and of finance in the Sicilian provisional government, but was shortly afterwards obliged to resign on account of the struggle between Garibaldi and the emissaries of Cavour with regard to the question of immediate annexation. Appointed secretary to Garibaldi, Crispi secured the resignation of Depretis, whom Garibaldi had appointed pro-dictator, and would have continued his fierce opposition to Cavour at Naples, where he had been placed by Garibaldi in the foreign office, had not the advent of the Italian regular troops and the annexation of the Two Sicilies to Italy brought about Garibaldi’s withdrawal to Caperna and Crispi’s own resignation. Entering parliament in 1861 as deputy of the extreme Left for Castelvetrano, Crispi acquired the reputation of being the most aggressive and most impetuous member of the republican party. In 1864, however, he made at the chamber a monarchical profession of faith, in the famous phrase afterwards repeated in his letter to Mazzini: “The monarchy unites us; the republic would divide us.” In 1866 he refused to enter the Ricasoli cabinet; in 1867 he worked energetically to impede the projected alliance with France, and to drive the Lanza cabinet to Rome. The death of Ratazzi in 1873 induced Crispi’s friends to put forward his candidacy to the leadership of the Left; but, Crispi, anxious to reassure the crown, secured the election of Depretis. After the advent of the Left he was elected (November 1876) president of the chamber. During the autumn of 1877 he went to London, Paris and Berlin on a confidential mission, establishing cordial personal relationships with Gladstone, Granville and other English statesmen, and with Bismarck.

In December 1877 he replaced Nicotera as minister of the interior in the Depretis cabinet, his short term of office (70 days) being signalized by a series of important events. On January 9, 1878, the death of Victor Emmanuel and the accession of King Humbert enabled Crispi to secure the formal establishment of a unitary monarchy, the new monarch taking the title of Humbert I. of Italy instead of Humbert IV. of Savoy. The remains of Victor Emmanuel were interred in the Pantheon instead of being transported to the Savoy Mausoleum at Superga. On the 9th of February, 1879, the death of Pius IX. necessitated a concave, the first to be held after the unification of Italy. Crispi, helped by Mancini and Cardinal Pecci (afterwards Leo XIII.), persuaded the Sacred College to hold the concave in Rome, and prorogued the chamber lest a papal declaration should mar the solemnity of the event. The statesman, in his address, dwelt on the occasion: at the storm of indignation conjured up by Crispi’s opponents in connexion with a charge of bigamy not susceptible of legal proof. Crispi was compelled to resign office, although the judicial authorities upheld the invalidity of his early marriage, contracted at Malta in 1853, and ratified his subsequent union with Signora Barbagallo. For nine years Crispi remained politically under a cloud, but in 1887 returned to office as minister of the interior in the Depretis cabinet, succeeding to the premiership upon the death of Depretis (July 29, 1887).

One of his first acts as premier was a visit to Bismarck, whom he desired to consult upon the working of the Triple Alliance. Basing his foreign policy upon the alliance, as supplemented by the naval entente with Great Britain negotiated by his predecessor, Count Rabilont, Crispi assumed a resolute attitude towards France, breaking off the prolonged and unfruitful negotiations for a new Franco-Italian commercial treaty, and refusing the French in lies to organize an Italian section at the Paris Exhibition of 1889. On the 18th of 1893, the minister secured the adoption of the Sanitary and Commercial Codes, and reformed the administration of justice. Forsaken by his Radical friends, Crispi governed Italy with the help of the Right until, on the 31st of January 1893, an intertempore allusion to the sancte memorie of the conservative party led to his overthrow. In December 1893 the impotence of the Giolitti cabinet to restore public order, then menaced by disturbances in Sicily and in Lunigiana, gave rise to a general demand that Crispi should return to power. Upon resuming office he vigorously suppressed the disorders, and steadily supported the energetic remedies adopted by Sonnino, minister of finance, to save Italian credit, which had been severely shaken by the bank and financial crises of 1862–1893. Crispi’s uncompromising suppression of disorder, and his refusal to abandon either the Triple Alliance or the Eritrean colony, or to forsake his colleague Sonnino, caused a breach between him and the radical leader Cavallotti. Cavallotti then began against him a pitiless campaign of defamation. An unsuccessful attempt upon Crispi’s life by the anarchist Lega brought a momentary truce, but Cavallotti’s attacks were soon renewed more fiercely than ever. They produced no effect that the general election of 1895 gave Crispi a huge majority, but, a year later, the defeat of the Italian army at Adowa in Abyssinia brought about his resignation. The ensuing Rudini cabinet lent itself to Cavallotti’s campaign, and at the end of 1897 the judicial authorities applied to the chamber for permission to prosecute Crispi for embezzlement. A parliamentary commission, appointed to inquire into the charges against him, discovered only that Crispi, on assuming office in 1893, had found the secret service coffers empty, and
CRISPIN
CRISPIN and CRISPINIAN, the patron saints of shoemakers, whose festival is celebrated on the 25th of October. Their history is largely legendary, and there exists no trace of it earlier than the 9th century. It is said that they were brothers and members of a noble family in Rome. They gave up their property and travelled with a certain Scipio (Noviodunum, Augusta Suessionum), who supported themselves by shoemaking and made many converts to Christianity. The emperor Maximianus (Herculis) condemned them to death. His prefect Rictiovarus endeavoured to carry out the sentence, but they emerged unharmed from all the ordeals to which he subjected them, and the weapons he used recoiled against the executioners. Rictiovarus in disgust cast himself into the fire, or the caldron of boiling tar, from which they had emerged refreshed. At last Maximian had their heads cut off (c. 287-300). Their remains were buried at Soissons, but were afterwards removed, partly by Charlemagne to Osnabrück (where a festival is observed annually on the 20th of June) and partly to the chapel of St Lawrence in Rome. The abbey of St Crispin-en-Châzy (the remains of which still form part of a farmhouse on the river Aisne, N.N.W. of Soissons), of St Crispin-le-Petit, and St Crispin-le-Grand (the site of which is occupied by a house belonging to the Sisters of Mercy), in or near Soissons, commemorated the places sanctified by their imprisonment and burial. There are also relics at Fuld, and a Kentish tradition of the legend that the bodies of the martyrs were cast into the sea and cast on shore on Romney Marsh (see Acta SS. Bolland, xl. 495; A. Butler, Lives of the Saints, October 23rd).

Especially in France, but also in England and in other parts of Europe, the festival of St Crispin was for centuries the occasion of solemn processions and merrymaking, in which gilds of shoemakers took the chief part. At Troyes, where the gild of St Crispin was reconstituted as late as 1820, an annual festival is celebrated in the church of St Urban. In England and Scotland the day acquired additional importance as the anniversary of the battle of Agincourt (cf. Shakespeare, Henry V. iv. 3); the symbolic processions in honour of “King Crispin” at Stirling and Edinburgh were particularly famous.

CRITIAS, Athenian orator and poet, and one of the Thirty Tyrants. In his youth he was a pupil of Gorgias and Socrates, but subsequently devoted himself to political intrigues. In 415 B.C. he was implicated in the mutiny of the Hermæ and imprisoned. In 411 he helped to put down the Four Hundred, and was instrumental in procuring the recall of Alcibiades. He was banished (probably in the democratic reaction of 407) and fled to Thessaly, where he stirred up the Penestæ (the helots of Thessaly) against their masters, and endeavoured to establish a democracy. Returning to Athens he was made ephor by the oligarchical party; and he was the most cruel and unscrupulous of the Thirty Tyrants who in 404 were appointed by the Lacedæmonians. He was slain in battle against Thrasybulus and the returning democrats. Critias was a man of varied talents—poet, orator, historian and philosopher. Some fragments of his elegies will be found in Bergk, Poetae Lyrici Graeci. He was also the author of several tragedies and of biographies of distinguished poets (possibly in verse).

See Xenophon, Helicena, ii. 3. 4. 19, Memorabilia, i, 2; Cornelius Nepos, Thalcybus (1840); Bolland, Monum. Hodiern. 12 (1843); Nestle, neu. Jahrb. f. d. kl. Altert. (1903).

CRITICISM (from the Gr. κριτική, a judge, κρίνω, to decide, to give an authoritative opinion), the art of judging the qualities and values of an aesthetic object, whether in literature or the fine arts. It involves, in the first instance, the formulation and expression of a judgment on the qualities of anything, and Matthew Arnold defined it in this general sense as “a disinterested endeavour to learn and propagate the best that is known and thought in the world.” It has come, however, to possess a secondary and specialized meaning as a published analysis of the qualities and characteristics of a work in literature or fine art, itself taking the form of independent literature. The sense in which criticism is taken as implying censure, the “picking holes” in any statement or production, is frequent, but it is entirely unjustifiable. There is nothing in the proper scope of criticism which presupposes blame. On the contrary, a work of perfect beauty and finish will, while it was written with a view to justice, is as proper a subject for criticism to deal with as a work of the greatest imperfection. It may be perfectly just to state that a book or a picture is “beneath criticism,” i.e. so wanting in all qualities of originality and technical excellence that time would merely be wasted in analysing it. But it can never be properly said that a work is “above criticism,” although it may be “above censure,” for the very complexity of its merits and the fulness of its beauties tempt the skill of the analyst and reward it.

It is necessary at the threshold of an examination of the history of criticism to expose this laxity of speech, since nothing is more confusing to a clear conception of this art than to suppose that it consists in an effort to detect what is blameworthy. Candid criticism should be neither benevolent nor adverse; its function is to give a just judgment, without partiality or bias. A critic (κριτικός) is one who exercises the art of criticism, who sets himself up, or is set up, as a judge of literary and artistic merit. The irritability of mankind, which easily forgets and neglects praise, but cannot forgive the rankling poison of blame, has set upon the word critic a seal which is even more unanswerable than that of criticism. It takes its most savage form in Benjamin Disraeli’s celebrated and deplorable dictum, “the critics are the men who have failed in literature and art.” It is plain that such names as those of Aristotle, Dante, Dryden, Joshua Reynolds, Sainte-Beuve and Matthew Arnold are not to be thus swept by a reckless fulmination. There have been

1 It is in this general sense that the subject is considered in this article. The term is, however, used in more restricted senses, generally with some word of qualification, e.g. textual criticism or higher criticism; see the article TEXTUAL CRITICISM and the article BIBLE for an outstanding example of both “textual” and higher.”
many critics who brought forth in failure in imaginative composition a cavilling, jealous and ignoble temper, who have mainly exercised their function in indulging the evil passion of envy. But, so far as they have done this, they have proved themselves bad critics, and neither minute care, nor a basis of learning, nor wide experience of literature, salutary as all these must be, can avail to make that criticism valuable which is founded on the desire to exaggerate fault-finding and to emphasize censure unfairly. The examination of what has been produced by other ages of human thought is much less liable to this dangerous error than the attempt to estimate contemporary works of art and literature. There are few indeed whom personal passion can blind to the merits of a picture of the 15th or a poem of the 17th century. In the higher branches of historical criticism, prejudice of this ignoble sort is hardly possible, and therefore, in considering criticism in its ideal forms, it is best to leave out of consideration that invidious and furtive species which bears the general name of "reviewing." This pedestrian criticism, indeed, is useful and even indispensable, but it is, by its nature, ephemeral, and it is liable to a multitude of drawbacks. Even when the reviewer is, or desires to be, strictly just, it is almost impossible for him to stand far enough back from the object to judge it objectively; he is dazzled, or scandalized, by its novelty; he has formed a preconceived notion of the degree to which its author should be encouraged or depressed; he is himself, in all cases, an element in the mental condition which he attempts to judge, and if not positively a defendant is at least a jurymen in the court over which he ought to preside with remote impartiality.

It may be laid down as the definition of criticism in its pure sense, that it should consist in the application, in the most competent form, of the principles of literary composition. Those principles are the general aesthetics upon which taste is founded; they take the character of rules of writing. From the days of Aristotle the existence of such rules has not been doubted, but different orders of mind in various ages have given them diverse application, and upon this diversity the fluctuations of taste are founded. It is now generally admitted that in past ages critics have too often succumbed to the temptation to regulate taste rigidly, and to lay down rules that shall match every case with a formula. Over-legislation has been the bane of official criticism, and originality, especially in the fine arts, has disappeared because it did not conform to existing rules. Such instances of want of contemporary appreciation as the reception given to William Blake or Keats, or even Milton, are quoted to prove the futility of criticism. As a matter of fact they do nothing of the kind. They merely prove the immutable principles which underlie all judgment of artistic products to have been misunderstood or imperfectly obeyed during the life-times of those illustrious men. False critics have built domes of glass, as Voltaire put it, between the heavens and themselves, domes which genius has to shatter in pieces before it can make itself comprehended. In critical application formulas are often useful, but they should be held lightly; when the formula becomes the tyrant where it should be the servant of thought, fatal error is imminent. What is required above all else by a critic is knowledge, tempered with good sense, and combined with an exquisite delicacy of taste. He who possesses these qualities may go wrong in certain instances, but his error cannot become radical, and he is always open to correction. It is not his business crudely to proounce a composition "good" or "bad" as the case may be. If it is "good" and wherein it is "bad"; he must admire with independence and blame with careful candour. He must above all be assiduous to escape from pompous generalizations, which conceal lack of thought under a flow of words. The finest criticism should take every circumstance of the case into consideration, and hold it necessary, if possible, to know the author as well as the book. A large part of the reason why the criticism of productions of the past is so much more fruitful than mere contemporary reviewing, is that by remoteness from the scene of action the critic is able to make himself familiar with all the elements of age, place and medium which affected the writer at the moment of his composition. In short, knowledge and even taste are not sufficient for perfect criticism without the infusion of a still rarer quality, breadth of sympathy.

Criticism has been one of the latest branches of literature to reach maturity, but from very early times the instinct which induces mankind to review what it has produced led to the composition of imperfect but often extremely valuable bodies of opinion. What makes these early criticisms tantalizing is that the moral or political aspects of literature had not disengaged themselves from the purely intellectual or aesthetic.

To pass to an historical examination of the subject, we find that in antiquity Aristotle was regarded as the father and almost as the founder of literary criticism. Yet before his day, three Greek writers of eminence had examined, in more or less fulness, the principles of composition: these were Plato, Isocrates and Aristophanes. The comedy of The Frogs, by the latter, is the earliest specimen we possess of hostile literary criticism, being devoted to ridicule of the plays of Euripides. In the cases of Plato and Isocrates, criticism takes the form mainly of an examination of the rules of rhetoric. We reach, however, much more modern times when we consider the works of Aristides, Longinus and Saintsbury. The Rhetoric are among the most valuable treatises which antiquity has handed down to us. Of what existed in the literature of his age, extremely rich in some branches, entirely empty in others, Aristotle speaks with extraordinary authority; but Mr G. Saintsbury has justly remarked that as his criticism of poetry was injuriously affected by the non-existence of the novelist, so his criticism of prose was injuriously affected by the omnipresence of the orator. This continues true of all ancient criticism. A work by Aristotle on the problems raised by a study of Homer is lost, and there may have been others of a similar nature; in the two famous treatises which remain we have nothing less important than the foundation on which all subsequent European criticism has been raised. It does not appear that any of the numerous disciples of Aristotle understood his attitude to literature, nor do the later philosophical schools offer much of interest. The Neoplatonists, however, were occupied with analysis of the Beautiful, on which both Proclus and Plotinus expatiated; still more purely literary were some of the treatises of Porphyry. There seems to be no doubt that Alexandria possessed, in the third century, a whole school of critic-grammatiers; the names of Zenodotus, of Crates and of Aristarchus were eminent in this connexion, but of their writings nothing substantial has survived. They were followed by the scholiasts, and they by the mere rhetoricians of the last Greek schools, such as Hermogenes and Apollonius. In the 2nd century of our era, Dio Chrysostom, Aristides of Smyrna, and Maximus of Tyre were the main representatives of criticism, and they were succeeded by Philostratus and Libanius. The most modern of post-Christian Greek critics, however, is unquestionably Dionysius of Halicarnassus, who leads up to Lucian and Cassius Longinus. The last-mentioned name calls for special notice; in "the lovely and magnificent personality of Longinus" we find the most intelligent judge of literature who wrote between Aristotle and the moderns. His book On the Sublime (Περὶ καμάτης), probably written about A.D. 260, and first printed in 1554, is of extreme importance, while his intuitions and the splendour of his style combine to lift Longinus to the highest rank among the critics of the world.

The Roman literature criticism never took a very prominent position. In early days the rhetorical works of Cicero and the famous Art of Poetry of Horace exhaust the category. During the later Augustan period the only literary critic of importance was the elder Seneca. Passing over the valuable allusions to the art of writing in the poets, especially in Juvenal and Martial, we reach, in the Silver Age, Quintilian, the most accomplished of all the Roman critics. His Institutes of Oratory has been described as the fullest and most intelligent application of criticism to literature which the Latin world produced, and one which places the name of Quintilian not far below those of Aristotle and Longinus. He was followed by Aulus Gellius.
by Macrobius (whose reputation was great in the middle ages), by Servius (the great commentator on Virgil), and, after a long interval, by Martianus Capella. Latin criticism sank into mere pedantry about rhetoric and grammar. This continued throughout the Dark Ages, until the 13th century, when rhetorical treatises, of which the Labarinthus of Eberhard (1227) and the Ars rhythmica of John of Garlandia (John Garland) are the most famous, came into fashion. These writings testified to a growing revival of a taste for poetry.

It is, however, in the masterly technical treatise De vulgari eloquentia, generally attributed to Dante, the first printed (in Italian) in 1520, that modern poetic criticism takes its first step. The example of this admirable book was not adequately followed; throughout the 14th and 15th centuries, criticism is mainly indirect and accidental. Boccaccio, indeed, is the only figure worthy of mention, between Dante and Erasmus. With the Renaissance came a blossoming of Humanist criticism in Italy, producing such excellent specimens as the Sylvae of Poliziano, the Poetics (1527) of Vida, and the Poetica of Trissino, the best of a whole crop of critical works produced, often by famous names, between 1525 and 1560. These were followed by sounder scholars and acute theorists: by Scaliger with his epoch-making Poetics (1561); by L. Castelvetro, whose Poetica (1570) started the modern cultivation of the Unities and asserted the value of the Epic; by Tasso with his Discorsi (1586); and byFrançois Rabelais in his Poetica (1586).

In France, the earliest and for a long time the most important specimen of literary criticism was the Défense et illustration de la langue française, published in 1549 by Joachim du Bellay. Ronsard, also, wrote frequently and ably on the art of poetry. The theories of the Pleiade were summed up in the Art poétique of Vauquelin de la Fresnaye, which belongs to 1574 (though not printed until 1605).

In England, the earliest literary critic of importance was Thomas Wilson, whose Art of Rhetoric was printed in 1553, and the earliest student of poetry, George Gascoigne, whose Instruction appeared in 1575. Gascoigne is the first writer who deals intelligently with the subject of English prosody. He was followed by Thomas Drant, Harvey, Gosson, Lodge and Sidney, whose controversial pamphlets belong to the period between 1575 and 1580. Among Elizabethan "arts" or "defences" of English poetry are to be mentioned those of William Webbe (1586), George Puttenham (1586), Thomas Campion (1602), and Samuel Daniel (1603). With the tracts of Ben Jonson, several of them lost, the criticism of the Renaissance may be said to close.

A new era began throughout Europe when Malherbe started, about 1600, a taste for the neo-classic or anti-romantic school of poetry, taking up the line which had been foreshadowed by Castelvetro. Enfin Malherbe vient, and he was supported in his revolution by Regnier, Vaugelas, Balzac, and finally by Corneille himself, in his famous prefatory discourses. It was Boileau, however, who more than any other man stood out at the close of the 17th century as the law-giver of Parnassus. The rules of the neo-classics were drawn together and arranged in a system by René Rapin, whose authoritative treatises mainly appeared between 1668 and 1674. It is in writings of this man, and of the Jesuits, Le Bossu and Bouhours, that the prepossession of the formal classic criticism is most plainly seen. The influence of these three critics was, however, very great throughout Europe, and we trace it in the writings of Dryden, Addison and Rymer. In the course of the 18th century, when the neo-classic creed was universally accepted, Pope, Blair, Kames, Harris, Goldsmith and Samuel Johnson were its most distinguished exponents in England, while Voltaire, Buffon (to whom we owe the phrase "the style is the man"), Marmontel, La Harpe and Suard were the types of academic opinion in France.

Modern, or more properly Romantic, criticism came in when the neo-classic tradition became bankrupt throughout Europe at the very close of the 18th century. It has been heralded by Germany by the writings of Lessing, and in France by those of Diderot. Of the reconstruction of critical opinion in the 19th century it is impossible to speak here with any fulness, it is contained in the record of the recent literature of each European language. It is noticeable, in England, that the predominant place in it was occupied, in violent contrast with Diderot's dictum, by those who had obviously not failed in imaginative composition, by Wordsworth, by Shelley, by Keats, by Landor, and pre-eminently by S. T. Coleridge, who was one of the most penetrative, original and imaginative critics who have ever lived.

In France, the importance of Sainte-Beuve is not to be ignored or even qualified; after manifold changes of taste, he remains as much a master as he was a precursor. He was followed by Théophile Gautier, Saint-Marc, Girardin, Paul de Saint Victor, and a crowd of others, down to Taine and the latest school of individualistic critics, comparable with Matthew Arnold, Pater, and their followers in England.

Brunetiére, Anatole France, Walter Pater, passim.

CRITOLAUS, Greek philosopher, was born at Phaselis in the 2nd century B.C. He lived to the age of eighty-two and died probably before 111 B.C. He studied philosophy under Aristo of Ceos and became one of the leaders of the Peripatetic school by his eminence as an orator, a scholar and a moralist. There has been considerable discussion as to whether he was the immediate successor of Aristoc, but the evidence is confused and unprofitable. In general he was a loyal adherent to the Peripatetic succession (cf. Cicero, De fin. v. 5 "C. imitari antiquos voluit").

Critius and Nesiotes, two Greek sculptors of uncertain school, of the time of the Persian Wars. When Xerxes carried away to Persia the statues of Harmodius and Aristogiton made by Antenor, Critius and Nesiotes were commissioned to replace them. By the help of coins and reliefs, two statues at Naples, wrongly restored as gladiators, have been identified as copies of the tyrannicides of Critius; and to them well apply the words in which Lucian (Rhetor. prooepita, 9) describes the works of Critius and Nesiotes, "closely knit and sinewy, and hard and severe in outline." Critius also made a statue of the armed runner Epicharinus.

CRITOLAUS, Greek philosopher, was born at Phaselis in the 2nd century B.C. He lived to the age of eighty-two and died probably before 111 B.C. He studied philosophy under Aristo of Ceos and became one of the leaders of the Peripatetic school by his eminence as an orator, a scholar and a moralist. There has been considerable discussion as to whether he was the immediate successor of Aristoc, but the evidence is confused and unprofitable. In general he was a loyal adherent to the Peripatetic succession (cf. Cicero, De fin. v. 5 "C. imitari antiquos voluit"). Further, he defended against the Stoics the Peripatetic doctrine of the eternity of the world and the indestructibility of the human race. There is no observed change in the natural order of things; mankind re-creates itself in the same manner according to the capacity given by Nature, and the various ills to which it is heir, though fatal to individuals, do not avail to modify the whole. Just as it is absurd to suppose that man is merely earth-born, so the possibility of his ultimate destruction is inconceivable. The world, as the manifestation of eternal order, must itself be immortal. The life of Critolaus is not recorded. One incident alone is preserved. From Cicero (Acad. ii. 43) it appears that he was sent with Carneades and Diogenes to Rome in 156-155 B.C. to protest against the fine of 500 talents imposed on Athens in punishment for the sack of Oropus. The three ambassadors lectured on philosophy in Rome with so much success that Cato was alarmed and had them dismissed the city. Gellius describes his arguments as scita et teritia.

CRITTENDEN—CROATIA-SLAVONIA

CRITTENDEN, JOHN JORDAN (1817–1863), American statesman, was born in Versailles, Kentucky, on the 10th of September 1817. After graduating at the College of William and Mary in 1837, he began the practice of law in his native state. He served for three months, in 1818, as attorney-general of Illinois Territory, but soon returned to Kentucky, and during the War of 1812 he was for a time on the staff of General Isaac Shelby. In 1811–1817 he served in the state House of Representatives, being speaker in 1815–1816, and in 1817–1819 was a United States senator. Settling in Frankfort, he soon took high rank as a criminal lawyer, was in the Kentucky House of Representatives in 1825 and 1829–1832, acting as speaker in the latter period, and from 1827 to 1829 was United States district-attorney. He was removed by President Jackson, to whom he was radically opposed. In 1835, as a Whig, he was again elected to the United States Senate, and was re-elected in 1841, but resigned to enter the cabinet of President W. H. Harrison as attorney-general, continuing after President Tyler's accession and serving from March until September. He was again a member of the United States Senate from 1842 to 1848, and in 1848–1850 was governor of Kentucky. He was an ardent and outspoken supporter of Clay's Free-Soil policy, and in 1850 re-entered President Fillmore's cabinet as attorney-general, serving throughout the administration. From 1855 to 1861 he was once more a member of the United States Senate. During these years he was perhaps the foremost champion of Union in the South, and strenuously opposed the Kansas-Nebraska Bill, which he declared prophetic would unite the various elements of opposition in the North, and render the breach between the sections irreparable. Nevertheless he laboured unceasingly in the cause of compromise, gave his strong support to the Bell and Everett ticket in 1860, and in 1860–1861 proposed and vainly contended for the adoption by congress of the compromise measures which bear his name. When war became inevitable he threw himself zealously into the Union cause, and lent his great influence to keep Kentucky in the Union. In 1861–1863 he was a member of the national House of Representatives, where, while advocating the prosecution of the war, he opposed such radical measures as the division of Virginia, the enlistment of slaves and the Conscription Acts. He died at Frankfurt, Kentucky, on the 26th of June 1863.

See the Life of J. J. Crittenden, by his daughter Mrs Chapman Coleman (2 vols., Philadelphia, 1871).

His son, GEORGE BIBB CRITTENDEN (1821–1880), soldier, was born in Russellville, Kentucky, on the 20th of March 1821, and graduated at West Point in 1832, but resigned his commission in 1833. He re-entered the army as a captain of mounted rifles in the Mexican War, served with distinction, and was brevetted major for bravery at Contreras and Churubusco. After the war he remained in the army, and in 1836 attained the rank of lieutenant-colonel. In June 1861 he resigned, and entered the service of the Confederacy. He was commissioned major-general and given a command in south-east Kentucky and Tennessee, but after the defeat of his forces by General George H. Thomas at Mill Springs (January 9, 1863), he was censured and gave up his command. He served subsequently as a volunteer aide on the staff of Gen. John S. Williams. From 1867 to 1871 he was state librarian of Kentucky. He died at Danville, Kentucky, on the 27th of November 1883.

Another son, THOMAS LEONIDAS CRITTENDEN (1821–1893), soldier, was also born at Russellville, Kentucky. He studied law, and practised with his father, and in 1842 became commonwealth's attorney. He served in the Mexican War as a lieutenant-colonel of Kentucky volunteers, and was an aide on Gen. Zachary Taylor's staff at the battle of Buena Vista. From 1849 to 1853 he was United States consul at Liverpool, England. Like his father, he was a strong Union man, and in September 1861 he was commissioned by President Lincoln a brigadier-general of volunteers. He commanded a division at Shiloh, for gallantry in which battle he was promoted major-general in July 1862. He was in command of a corps in the army of the Ohio under Gen. D. C. Buell, and took part in the battles of Stone River and Chickamauga. Subsequently he served in the Virginia campaign of 1864. He resigned his commission in December 1864, but in July 1866 entered the regular army with the rank of colonel of infantry, receiving the brevet of brigadier-general in 1867, served on the frontier and in several Indian wars, and retired in 1881. He died on the 23rd of October 1893.

CRIVELLI, CARLO, Venetian painter, was born in the earlier part of the 15th century. The only dates that can with certainty be given are 1468 and 1493; these are respectively the earliest and the latest years signed on his pictures—the former on an altar-piece in the church of San Silvestro at Massa near Fermo, and the latter on a picture in the Oggiioni collection in Milan. Though born in Venice, Crivelli seems to have worked chiefly in the March of Ancona, and especially in and near Ascoli; there are only two pictures of his proper to a Venetian building, both of these being in the church of San Sebastiano. He is said to have studied under Jacobello del Fiore, who was painting as late as any rate as 1435; at that time Crivelli was probably only a boy. The latter always signed as “Carolo Crivellus Venetus”; from 1490 he added “Miles,” having been then knighted (“Cavaliere”) by Ferdinand II. of Naples. He painted in tempera, oil, and water-colour, and he was not a specimen either in subject pictures of moderate size. He introduced aggressive and outspoken backgrounds; and was particularly partial to giving fruits and flowers (the peach is one of his favourite fruits) as accessories, often in pendent festoons. The National Gallery in London is well supplied with examples of Crivelli; the “Annunciation,” and the “Beato Ferretti” (of the same family as Pope Pius IX.) in religious ecstasy, may be specified. Another of his principal pictures is in San Francesco di Matelica; in Berlin is a “Madonna and Saints” (1491); in the Vatican Gallery a “Dead Christ,” and in the Brera of Milan the painter’s own portrait, with other examples. Crivelli is a painter of marked individuality,—hard in form, crudely definite in contour; stern, forced, energetic, almost grotesque and repellent, in feature and expression, and yet well capable of a prist sort of prettiness; simply vigorous in his effect of detachment and relief, and sometimes admitting into his pictures objects actually raised in surface; distinct and warm in colour, with an effect at once harsh and harmonious. His pictures gain by being seen in half-light, and the little dithyrambs in praise of his “bold” and “violent” form the spectator with uncommon power. Few artists seem to have worked with more uniformity of purpose, or more forthright command of his materials, so far as they go. It is surmised that Carlo was of the same family as the painters Donato Crivelli (who was working in 1459, and was also a scholar of Jacobello) and Vittorio Crivelli. Pietro Alamanni was his pupil.

See, along with Crowe and Cavalcaselle, Berenson, Venetian Painters of the Renaissance (1889); Morelli, Italian Painters (1892–1893); Rushforth, Carlo Crivelli (1900).

CROATIA-SLAVONIA (Serbo-Croatian Hrvatska i Slavonija; Hung. Horvát-Sálonorvág; Ger. Kroaten und Slawen), a kingdom of the Hungarian monarchy; bounded on the N. by Carniola, Styria and Hungary proper; E. by Hungary and Servia; S. by Servia, Bosnia and Dalmatia; and W. by the Adriatic Sea, Istria and Carniola. Until 1881 Croatia, in the N.W. of this region, was divided from Slavonia, in the N.E., by a section of the Austrian Military Frontier. This section is now the county of Bjelovar, and forms part of the united kingdom of Croatia-Slavonia. The river Kupa, which bisects the county of Agram, is usually regarded as the north-eastern limit of the Balkan Peninsula; and thus the greater part of Croatia, lying south of this river, falls within the peninsular boundary, while the remainder, with all Slavonia, belongs to the continental mainland. According to the official survey of 1900, the total area of the country is 16,423 sq. m. The Croatian littoral extends for about 90 m. from Fiume to the Dalmatian frontier. A narrow strait, the Canale della Morlaccà (or della Montagna), separates it from Veglia, Arbe, Pago and other Istrian or Dalmatian islands. The city and territories of Fiume, the sole important harbour on this coast, are included in Hungary proper, and controlled by the Budapest government. Westward from
Warasdin, and along the borders of Styria, Carniola, Istria, Dalmatia and north-western Bosnia, the frontier is generally mountainous and follows an irregular course. The central and eastern region, situated between the Drave and Danube on the north, and the Save on the south, forms one long wedge, with its point at Semlin.

**Physical Features.**—Croatia-Slavonia is naturally divided into two great sections, the highlands of the west and the lowlands of the east.

The plateau of the Istrin Karst is prolonged in several of the bare and desolate mountain chains between the Save and the Adriatic, notably the Great and Little Kapella (or Kapela), which link together the Karst and the Dinaric Alps, culminating in Biela Lažica (2029 ft.); the Pljevica or Piševica Planina (3410 ft.), overlooking the valley of the river Una; and the Velevit Planina, which follows the westward curve of the coast, and rises above the sea in an abrupt wall, unbroken by any considerable bay or inlet. As it skirts the Dalmatian border, this range attains its greatest altitude in the adjacent peaks of Svet Vrado (3751 ft.) and Vakanski Vrh (3768 ft.). Large tracts of the Dinaric highlands are well-watered, and it is only in the more sheltered bocé that sufficient soil collects for large trees to flourish. In northern Croatia and Slavonia the mountains are far more fertile, being often densely wooded with oaks, beeches and pines. They comprise the Ussok Gebirge, or Ussoks Mountains, named after the piratical Ussoks (g.v.) of Zengg, who were deported hither after the fall of their stronghold in 1617; the Warasdin Mountains, with the peak of Ivančica (3478 ft.); the Agram Mountains, culminating in Šijeome and Slemo (3396 ft.), and including the beautiful stretches of Alpine pasture known as the Zagorje, or “land beyond the hills”; the Bilo Gebirge, or White Mountains, a low range of chalk, and, farther to the south, several groups of mountains, among which Psunj (3228 ft.), Papuk (3217 ft.) Crni Vrh (2853 ft.), and the Ravnica Gora (2808 ft.) are the chief summits. All these ranges, except the Usok Gebirge, constitute the central watershed of the kingdom, between the Drave and Save. In the east Slavonian county of Syrmia the Fruska Gora or Vrdnik Mountains rise to a height of 1768 ft. along the southern bank of the Danube, their picturesque vineyards and pine or oak woods contrasting strongly with the plains that surround them.

The lowlands, in the valleys of the Drave, Danube, Save and Kupa, belong partly to the great Hungarian Plains, or Alfold. Besides the sterile and monotonous steppes, valuable only as pasture, and so sparsely populated that it is possible to travel for many hours without encountering any sign of human life except a primitive arastic, or shepherd’s hut, there are wide expanses of fen-country, regularly flooded in spring and autumn. The marshes which line the Save below Sissak are often impassable except at Bred and Mitrovia, and the river is constantly sweeping out fresh channels in the soft soil, only to abandon each in turn. The total area liable to yearly inundation exceeds 200 sq. m. But along the Drave and Danube the plains are sometimes strikingly fertile, and yield an abundance of grain, from which the Kulpa, which follows a tortuous course of 60 m. from its headwaters north of Fiume, to its confluence with the Save at Sissak. The Mežnica, Dobra, Glina and Konara are right-hand tributaries of the Kulpa. In the Croatian Karst the seven streams of the Lika unite and plunge into a rocky chasm near Gospić, and the few small brooks of this region usually vanish underground in a similar manner. Near Fiume, the Recina, Rjeka or Fiumara falls into the Adriatic after a brief course. There is no large lake in Croatia-Slavonia, but the upland pools and waterfalls of Plitvica, near Ogulin, are celebrated for their beauty. After a thaw or heavy rain, the subterranean rivers flood the mountain hollows of the Karst; and a lake thus formed by the river Gajka, near Otočac, has occasionally filled its basin to a depth of 160 ft.

**Minerals.**—The mineral resources of the kingdom, though capable of further development, are not rich. They are chiefly confined to the mountains, where iron, coal, copper, lead, zinc, silver and sulphur are mined in small quantities. Warm mineral springs rise at Toplice near Warasdin, at Stubica near Agram, and elsewhere.

**Climate.**—The climate of Croatia-Slavonia varies greatly in different regions. In the Karst it is liable to sudden and violent changes of temperature, especially during the summer, which renders navigation perilous among the islands of the coast, and, in winter, blocks the roads and railway-cuttings with deep snowdrifts. The sheltered bays near Fiume enjoy an equable climate; but in all other parts of the country the seasons are monotonous and, except in the lower coastal regions, the summer heats are excessive. Earthquakes are common among the mountains, and the eastern lowlands are exposed to the great winds and sandstorms which sweep down the Alfold. At Agram, during the years 1890-1891, the mean annual temperature was 52° F., with 34.6 in. of rain and snow; at Fiume, the figures for the same period were 57° and 71 in.

**Agriculture.**—The agricultural inquiry of 1891 showed that 94.5% of the country consists of arable land, gardens, vineyards, meadows, pasture and forest; but much of this area must be set down as mountainous and swampy pasture of poor quality. The richest land occurs in the Zagorje and its neighbourhood, in the hills near Warasdin and in the northern half of Syrmia. The Karst and the fens are of least agricultural value. The agriculturists are mainly engaged in growing wheat, barley, oats, maize, rye, buckwheat, and live stock, including grapes, which, though not indigenous, are found in the plains of Istria. Tobacco is grown in the county of Carniola, except in the vicinity of Agram, where it is cultivated with the object of preserving the soil from exhaustion. The principal crops of the country are: wheat, corn, hemp, flax, potatoes and tobacco, and the stallion, sheep and goats; besides a breed of cattle exported under the name of **slivonika** or **shkrimina**. Near Fiume the orange, lemon, pomegranate, fig and olive bear well; mulberries are planted on many estates for silk-worm culture, and the heather and heath favours the keeping of bees. Large herds of swine fattened in the oak and beech forests; and dairy-farming is a thriving industry in the highlands between Agram and Warasdin, where, during the last years, there were 70,000 head of dairy cattle. The lowlands are cultivated for the production of hay and grain, and there are many thousands of remounts shipped to the British army in South Africa. The local administration endeavours to better the quality of live-stock by importing purer breeds, distributing prizes, and other measures; but the native farmers are slow to accept improvements.

**Forests.**—Forests, principally of oak, pine and beech, covered 3,784,000 acres in 1891, about one-fifth being state property. Especially well wooded are the Croatian best-forests, near Agram and Sissak; Timber is exported from Fiume and down the Drave.

**Industries.**—Apart from the distilleries and breweries scattered throughout the country, the rude four-mills which lie moored in the Drave; the saw-mills, flour-mills, silk-mills and tobacco factories, the chief industrial establishments. There are arms factories at Agram, Fiume, Sissak, Bucari and Porto Re. Only 8.3 of the population was in 1900, engaged in industries other than farming, occupied 85.2%. The exports mainly consist of foodstuffs, especially wheat and barley, and live stock, and timber. The imports include textiles, iron, coal, wine and colonial products; with machinery and other finished articles. Goods in transit to and from Hungary figure largely in the official returns. Fiume and Sissak, which are the centres of the foreign trade. In 1900 Croatia-Slavonia possessed 235 banking establishments.

**Communications.**—The commerce of the country is furthered by upwards of 2000 m. of carriage-roads, the most remarkable of these

CROATIA-SLAVONIA

being the Maria Louisa, which connects Karlstadt with Fiume, and the Josephina, which passes inland from Zengg. Many excellent highways were built for strategic purposes before the abolition of the Military Frontier in 1881. The railways, which are all owned and managed by the Hungarian state, intersect most parts of the country except the mountains south of Ogulin, where there is, nevertheless, a considerable traffic over the passes into Dalmatia and Bosnia. Agram is the principal railway centre, from which lines radiate into the interior, to Novi, Zengg, and into Hungary, and S.E. into Bosnia by way of Kostajnica. The main line south from Agram passes through Brod, where it meets the Bosnian system, and on to Belgrade; throwing out two branch lines to Bela and Sarajevo, Bosnia, and several branches on the north, traverse the central watershed. All are Hungarian frontier at Zákány, Barcs, Esseg, Erdar and Peterwardein. Above Agram the Save is used chiefly for floating rafts of timber; east of Sisses it is navigable by small steamboats, but, despite its great length, the multitude of its perpetually shifting sandbanks interferes greatly with traffic. Steamers also ply on the Una, the Drave below Barcs, and the Danube. The marshes of Syria are partially drained by the so-called "Canal of Probus," the one large artificial waterway in the country, said to have been cut by the Romans in the 3rd century.

Chief Towns.—The principal towns are Agram, the capital, with 61,002 inhabitants in 1900; Esseg, the capital of Slavonia (24,630); Semlin (31,571); Mitrovina (11,518); Karinst (12,036); Karlstadt (7,936); Brod (7,310); Sisses (7,047); Djakovo (6,826); Karlovitz (5,663); Peterwardein (5,019); Zengg (3,832) and Buenos Aires (1870). These are described in separate articles. The greatest centre for road traffic is the small town of Karlovitz, which lies on the road to Belgrade, and at the southern end of the Kraba, Saradzin, Varazs and Bjelovar (6,036) are respectively the capitals of the five counties which belong to the Hungarian-ruled Slavonia, and the capitals of the north-eastern districts, Krba, Saradzin, Varazs and Bjelovar (Belveda-Klosters); while the capitals of the three Slavonian counties, Virovitica (Viroce), Pozega (Pozega) and Systre (Systrem), are Esseg, Pozega (5,000) and Semlin.

Population and National Characteristics.—The population rose from 1,892,499 in 1881 to 2,418,304 in 1900, an increase of less than 5 per cent. Third, resulting from a uniformly low death rate, the percentage of the population below 15 years of age is very low, by that preponderance of male over female children which is common to all the South Slavonic lands. More than 75% of the inhabitants are Croats, the bulk of the remainder being Serbs, who predominate in eastern Slavonia. Outside Croatia-Slavia, the Croats occupy the greater part of Dalmatia and northern Bosnia. There are large Croatian settlements in the south of Hungary, and smaller colonies in Austria. The numbers of the whole nation may be estimated at 3,500,000 or 4,000,000. The distinction between Croats and Serbs is religious, and, to a less extent, linguistic. Croats and Serbs together constitute a single branch of the Slavonic race, frequently called the Serbo-Croatian branch. The literary language of the two nations is identical, but the Croats use the Latin alphabet, while the Serbs prefer a modified form of the Cyrillic. The two nations have also been politically separated since the 7th century, if not for a longer period; but this division has produced little difference of character or physical type. Even the costume of the Croatian peasant, to whom bright and brilliant colours and intricate embroidery are always dear, proclaims their racial identity with the Serbs, their songs, dances and musical instruments, the chief part of their customs and folk-life, their whole manner of life, so little changed by its closer contact with Western civilization, may be studied in Servia (quz.) itself. In both countries rural society was based on the old-fashioned household community, or sodruga, which still survives in the territories that formed the Military Frontier, though everywhere tending to disappear and be replaced by individual ownership. The Croatian peasants are less prosperous in the riverside districts, where marshes prevail, and especially beside the Save. Even in many of the towns the houses are mere cabins of wood and thatch. As in Servia, there is practically no middle class between the peasants and the educated minority; and the commercial element consists to a great extent of foreigners, especially Germans, Hungarians, Italians and Jews. Numerically this alien population is insignificant. The Italians are chiefly confined to the coast; the Germans congregate at Semlin and Saradzin; the Slovaks settled along the north-western frontier, where they have introduced their language, and so greatly modified the local dialect; the gipsies wander from city to city, as horse-dealers, metal workers or musicians; there are numerous Moravian and Bohemian settlements; and near Mitrovica there is a colony of Albanians. It is impossible to give accurate statistics of the alien population; for, in the compilation of the official figures, language is taken as a test of nationality, an utterly untrustworthy method in a country where every educated person speaks two or three languages. Croatian nationalists also maintain that official figures are systematically altered in the Hungarian interest.

Constitution and Government.—By the fundamental law of the 21st of December 1867 Austria-Hungary was divided, for purposes of internal government, into Cisleithania, or the Austrian empire, and Transleithania, or the kingdoms of Hungary and Croatia-Slavia. In theory the viceroy, or ban of Croatia-Slavia, is nominated by the crown, and enjoys almost unlimited authority over local affairs; in practice the consent of the crown is purely formal, and the ban is appointed by the Hungarian provincial authorities. He can deal with the financial affairs of his department, except as referred to the crown, and when the government is subject to the ban, and comprises three ministries—the interior, justice, and religion and education—for whose working the ban is responsible to the Hungarian premier, and to the national assembly of Croatia-Slavia (Narodna Skupština). This body consists of a single chamber, composed partly of elected deputies, partly of privileged members, whose numbers cannot exceed half those of the deputies. There are 69 constituencies, besides the 21 royal free cities which also return deputies. Electors must belong to certain professions or pay a small tax. The privileged members are the heads of the nobility, with the highest ecclesiastics and officials. As a rule, they represent the "Magyarist" section of society, which sympathizes with Hungarian policy. The chamber deals with religion, education, justice and certain strictly provincial affairs, but even within this limited sphere all its important enactments must be countersigned by the minister for Croatia-Slavia, a member, without portfolio, of the Hungarian cabinet. At the present votes are given on a system which facilitates corruption; the officials who control the elections depend for their livelihood on the ban, usually a Magyarist; and thus, even apart from the privileged members, a majority favourable to Hungary can usually be secured. The constitutional relations between Hungary and Croatia-Slavia are regulated by the agreement, or nagoda, of 1868. This instrument determines the functions of the ban; the control of common interests, such as railways, posts, telegraphs, telephones, commerce, industry, agriculture or forests; and the choice of delegates by the chamber, to sit in the Hungarian parliament. See also below, under History.

For administrative purposes Croatia-Slavia is divided into 8 rural counties, already enumerated; besides the 4 urban counties, or municipalities of Agram, Semlin, Saradzin and Esseg. These are subdivided into 24 rural and 2 urban districts, each with its representative council. The affairs of each rural county are managed by an assembly chosen for 6 years, which comprises not only elected members, but delegates from the cities except Agram and Esseg, with certain high ecclesiastics and officials. The highest judicial authority is the supreme court or Septemvriale Table, which sits at Agram, and ranks above the royal court of appeal, the municipal courts of first instance, and the district courts or magistracies. Full four-fifths of the population belong to the Roman Catholic Church, which has an archbishop at Agram and bishops at Zengg and Djakovo. There are about 12,000 Greek Catholics, with a bishop at Kreus (Krizevac). The Serb congregations, who had previously been classed as Orthodox Greek, were officially recognized as members of the Orthodox Church of Servia after 1849. Their episcopal sees of Karlowitz and Pakrac depend upon the metropolitanate of Belgrade; but from 1830 to 1838 Karlowitz was itself the headquarter of the Servian Church.

During the 19th century strenuous efforts to better the state of education were made by Bishop Strossmayer (1815-1905) and other

1 It is important to notice the value of the following letters and signs, which recur frequently: = e = ç = ch (hard); = e = ch (soft); = y =, or in German; = s = h, = z = k, or in French.
CROATIA-SLAVONIA

reformers; but, although some success was achieved, only one-third of the population could read and write in 1900. Foremost among the educational institutions is the South Slavonic Academy of Sciences and Arts (Jugoslavenska Akademija Znanosti i Umjetnosti), founded in 1874, possesses some faculties—philosophy, law, and modern languages, as well as classics and mathematics; 1,400 elementary schools; and a few special institutions, such as the naval and military academies of Fiume, ecclesiastical seminaries and commercial schools. In almost every case the language of instruction is Serbo-Croatian. The development of higher education, without a corresponding advance of technical education, has created an intellectual class, comprising many men of letters, and several painters, musicians and sculptors, though none of great eminence; it also tends to produce many aspirants to official or professional careers, who find employment difficult to obtain. The want of a strong native middle class may partly be traced to this tendency.

History.

Medieval historians did not use the terms Croatia and Slavonia in their present sense. The Croatia of the middle ages comprised north-western Bosnia, Turkish Croatia, and the region now known as Upper Croatia. The whole country between the Drave and Save, thus including a large part of modern Croatia, was called in Latin Slavonia, in German Windschles Land, and in Hungarian Tatorasor, to distinguish it from the territories in which the Croats were racially supreme (Hordorsor). At the time of their conquest by the Romans (39 B.C.) both these divisions were occupied by the Pannonians, who in Slavonia had displaced an older population, the Scordisci; and both were included in the Roman province of Pannonia Inferior, although Slavonia had the distinctive name of Pannonia Savia (see Pannonia). When the Roman dominions were broken up in A.D. 568, Croatia-Slavonia remained part of the Western empire. The Ostrogoths overran it in 489; in 535 it was annexed by Justinian; in 568 it was conquered by the Avars. These were in turn expelled from Croatia by the Croats, a Slavonic people from the western Carpathians, who, according to some authorities, had occupied the territories of the Marcomanni in Bohemia, and been driven thence in the 6th century by the Czechs. The main body of the Croats, whose tribal and racial names respectively are perpetuated in the names of Croatia and Slavonia, entered Croatia between 634 and 638, and were encouraged by the emperor Heraclius to attack the Avars. Smaller bodies had led the way southwards since 548. The Croats formed the western division of the great migratory horde of Serbo-Croats which colonized the lands between Bulgaria and the Adriatic. Contemporary chroniclers called them Chrobati, Belochrobati ("White Croats"), Chrovi, Horati, or by some similar Latin or Byzantine variant of the Slavonic Khrovi. The Croats occupied most of the region now known as Croatia-Slavonia, Dalmatia, and north-western Bosnia, displacing or absorbing the earlier inhabitants everywhere except along the Dalmatian coast, where the Italian city-states usually maintained their independence, and in certain districts of Slavonia, where, out of a mixed population of Slavonic immigrants, Avars and Pannonians, the Slavs, and especially the Serbo-Croats, gradually became predominant. The Croats brought with them their primitive tribal institutions, organized on a basis partly military, partly patriarchal, and identical with the Zhupanates of the Serbs (see Serbia); agriculture, war and hunting were their chief pursuits. Although they at first acknowledged no alien sovereign, they passed gradually under Italian influence in the extreme west, and under Byzantine influence in the south and south-east. In 866 the northern and north-eastern districts were added to the empire of the Franks, and thus won for the Western Church. Frankish predominance was long commemorated by the name Franchochor, given by the Byzantines to Syria; it is still commemorated by the name Fruska Gora, "Mountains of the Franks," in that province.

The Croatian Kingdom: c. 910-1091.—In 877 the Croats were temporarily subdued by the Byzantine emperor, but after successive insurrections which tended to centralize their loosely knit tribal organization, and to place all power in the hands of a military chief, they regained their independence and founded a national kingdom about 910. It is probable that Tomislav or Timislav, who had led their armies to victory, assumed the title of king in that year. Some authorities, however, state that Tomislav only bore the title of veliki kuman or "paramount chief," and was only one in a long line of princes which can be traced without interruption back to 818. On this view, Drzislav (c. 978-1000) was the first king properly so called. But Tomislav, whatever his official style, was certainly the first of a series of independent national rulers which lasted for nearly two centuries. The records of this period, regarded by many Croats as the golden age of their country, are often scanty, and its chronology is still unsettled. Little is known of Trpimir, who preceded Drzislav, or of Stephen I. (1035-1058), but a few of the kings gained a more lasting fame by their success in war and diplomacy. Among these were Kresimir I. (c. 940-946), his successor Miroslav, and especially Kresimir II., surnamed the Great (c. 1000-1035), who harried the Bulgarians, at that time a powerful nation, and conquered a large part of Dalmatia, including some of the Italian cities. Already, under his predecessors, the Croats had built a fleet, which they used first for piracy and afterwards for trade. Their skill in maritime affairs, exemplified first in the 9th century by the pagan corsairs of the Narenta (see Dalmatia: History), and later by the numerous Dalmatian and Croatian sailors who served in the navies of Venice and Austria, is remarkable in a Slavonic people, and one which had so recently migrated from central Europe. At the end of the 10th century they even for a short period exacted tribute from Venice, but their power was temporarily destroyed in 1000, when the Venetians captured and sacked Biograd or Belgrade, the Italian Zaravcevica. This Dalmatian port was not only the Croatian arsenal, but the seat of the kings, who here sought to enhance their dignity by borrowing the pageantry and pomp of the papacy. Here they held their courts, and the city was the scene of many religious assemblies, and the residence of the bishops of Dalmatia. The bishop of Dalmatia was a powerful prelate, and in the 11th century he was able to claim the city as his fief. This new power was linked with the rise of the nobility, the augmentation of the royal clergy, and the growth of a more elaborate and elaborate procedure of the Byzantine court. Kresimir II. and Kresimir Peter (c. 1058-1073), the hero of many national legends and lays, restored the naval power of the Croats. After the death of Kresimir Peter, Slavic or Slavian reigned until 1076, when he was succeeded by Zvonimir (Svinimir or Zvonimir) Demetrius. Zvonimir was crowned by the legate of Pope Gregory VII., and appears to have been regarded as a vassal of the papacy. Both he and Stephen II., a nephew of Kresimir II., died in 1089.

Hungarian Supremacy: 1091-c. 1256.—Amid the strife of rival claimants to the throne, Helena, the widow of Stephen, appealed for aid to her brother Ladislaus I., king of Hungary. Ladislaus took possession of the country in 1091. He founded the bishopric of Agram and introduced Hungarian law. His death in 1095 was the signal for a nationalist insurrection, but after two years the rebels were crushed by his successor Coloman. This monarch reorganized the administration on a system which has been maintained, with modifications in detail, by almost all his successors. He reduced the Dalmatian nobility to vassalage, and the conquered territory so far as to leave its autonomy in domestic affairs intact; but delegated his own sovereignty, and especially the control of foreign affairs and war, to a governor known as the ban (q.v.). This office was sometimes held by princes of the royal house, often by Croatian nobles. Coloman also extended his authority over Dalmatia and the islands of the Quarnero, but the best modern authorities reject the tradition that in 1102 he was crowned king of Croatia, Slavonia and Dalmatia. In 1127 Syrmia, which had been annexed to Bulgaria from about 700 to 1018, and to the Eastern empire from 1019, was united to Slavonia. The Hungarian government left much liberty to the Croatian nobles, a turbulent and fanatical class, ever ready for civil war, rebellion or a campaign against the Bosnian heretics. Their most powerful leaders were the counts of Zrin and Brebri (or Brebri), whose surname was Subij.
family played an important part in local politics from the 13th century to 1670, when Peter Šubić was its last member to hold the office of ban. Paul Šubić (d. 1312) and Mladen Šubić (d. 1322) even for a short period united Croatia, Slavonia, and part of Dalmatia under their own rule. From 1322 to 1326 the Croatian nobles successfully withstood the armies of Hungary and Bosnia; from 1337 to 1340, instigated by the Vatican, they carried on a crusade against the Bosnian Bogomils; and in the Krajna (Turkish Croatia) hostilities were resumed at intervals until the Turkish conquest.

The Turkish Occupation: c. 1526-1718 — Here, as elsewhere, the Ottoman invasion was facilitated by the feuds of the Christian sects. When King Matthias Corvinus undertook to defend Slavonia in 1490 it was too late; Matthias lost Syria and died in the same year. His successor Ladislaus of Poland (1490-1516) added Slavonia to the kingdoms named in the royal title, which now included the words “King of Dalmatia and Croatia and Slavonia” (rex Dalmatiae et Croatiae et Slavoniae). But he failed to repel the Turks, who in 1526 destroyed the power of Hungary at the battle of Mohác. In 1527 the Croats were compelled to swear allegiance to Ferdinand I of Austria, who had been elected king of Hungary. Ferdinand founded the general of Karlsstadt and thus laid the foundation of the military frontier. The provinces of Agram, Karlovac, and Karavac, previously included in Slavonia, were added to Croatia, to counterbalance the loss of territory in the Krajina. Throughout the century the Turks continued to extend their conquests until, in 1606, the emperor retained only western Croatia, with the cities of Agram, Karlsstadt, Karlovac, and Zeng. During the same period the doctrines of the Reformation had spread among the Croats; but they were forcibly suppressed in 1607-1610. The military occupation by the Turks left little permanent impression; colonization was never attempted; and the continuous wars by which the victors strove to secure or enlarge their dominions north of the Save left no time for the introduction of Moslem religion or civilization among the vanquished. Thus in the reconquest of Croatia-Slavonia there was none of the local opposition which afterwards hindered the Austrian occupation of Bosnia. The success of Prince Eugene in 1667 led two years later to the peace of Carlowitz, by which the Turks ceded the greater part of Slavonia and Hungary to Austria; and the remainder was surrendered in 1718 by the treaty of Passarowitz. Only Turkish Croatia henceforth remained part of the Ottoman empire.

Austrian and French Supremacy: 1718-1814 — Austrian influence predominated throughout Croatia-Slavonia during most of the 18th century, although Slavonia was constitutionally regarded as belonging to Hungary. Despite Magyar protests the misleading name “Croatia” was popularly and even in official documents applied to the whole country, including the purely Slavonian provinces of Virovitica, Polega, and Syrmia. From 1767 to 1777 Croatia, Slavonia, and Dalmatia were collectively named Illyria, and governed from Vienna, but each of these divisions was subsequently declared a separate kingdom, with a separate administration, while the military frontier remained under separate military rule. In 1776 the Croatian seaboard, which had previously been under the same administration as the rest of the Austrian coast, was annexed to Croatia, but three years later Fiume was declared an integral part of Hungary. These administrative changes, and especially the brief existence of united “Illyria,” stimulated the dormant nationalism of the Croats and their jealousy of the Magyars. In 1789 Austria was forced to surrender to Napoleon a large part of Croatia, with Dalmatia, Istria, Carnithia, Carniola, Götz, and Gradiska. These territories received the name of the Illyrian Provinces, and remained under French rule until 1813. All the Croats capable of service were enrolled under the French flag; their country was divided for administrative purposes into Croatia civile and Croatia militare. In 1814 Dalmatia was incorporated in Austria, while Istria, Carnithia, Carniola, Götz, and Gradiska became the Illyrian kingdom of Austria, and retained their united government until 1849. Croatia and Slavonia were declared appanages of the Hungarian crown — portae adnexae, or subject provinces, according to the Magyars; regna sua, or united kingdoms, according to their own view. Each phrase afterwards became the watchword of a political party: neither is accurate. The Croats preserved their local autonomy, the use of their language for official purposes, their elected diet and other ancient institutions, but Hungarian control was represented by the ban.

The National Revival — The Croats acquiesced in their position of inferiority until 1840, when the Magyars endeavoured to introduce Hungarian as the official language. A nationalist or “Illyrian” party was formed under Count Drasković and Bishop J. Strossmayer (q.v.) to combat Hungarian influence and promote the union of the “Illyrian” Slavs, i.e., the Croats, Slovenes, and Serbs. Ljudevit Gaj, the leading Croatian publicist, strongly supported the movement. The elections of 1842 were marked by a series of sanguinary conflicts between Illyrists and Magyars, but not until 1848 were the Illyrists returned to office. One of their leaders, Baron Josef Jellachich, was appointed ban in 1848. He strongly advocated the union of Croatia with Carinthia and Carniola and Styria, but found his policy thwarted as much by the apathy of the Slovenes as by the hostility of the Magyars. A Croatian deputation was received at Innsbruck by Ferdinand V., but before its arrival the Hungarians had obtained a royal manifesto hostile to Illyrism. But failure only increased the agitation among the southern Slavs; all attempts at mediation proved unsuccessful, and on the 31st of August the Croats claimed to have convinced the king that justice was on their side. On the 11th of September the advance-guard of their army crossed the Drave under the command of Jellachich. On the 29th they were driven back from Fakozd by the Hungarians, and retired towards Vienna; they subsequently aided the Austrian army against the Hungarian revolutionaries (see JELLYCHICH, JOSEF, and HUNGARY: HISTORY). The constitution of 1849 proclaimed Croatia and Slavonia separated from Hungary and united as a single Austrian crownland, to which was annexed the Croatian littoral, including Fiume. Austrian supremacy lasted until 1867; no ban was appointed, and owing to the suspension of local autonomy from 1850 to 1867, this period is known as “the ten years of reaction.” It was ended by the celebrated “October Diploma” of the 20th of October 1860, which promised the restoration of constitutional liberty. But the so-called “Constitution of February” (21st February 1861) placed all practical power in the hands of an executive controlled by the government at Vienna. The newly elected diet was soon dissolved for its advocacy of a great South Slavonic confederation under imperial rule, and no other was elected until 1865.

From 1865 to 1867 Strossmayer and the nationalists endeavoured to secure the formation of a subordinate Austrian kingdom comprising Dalmatia, Croatia-Slavonia, and the islands of the Quarnero. The Magyars had, however, resolved to subject Croatia-Slavonia to the crown of St Stephen, and in 1867 had secured control of the finances and electoral machinery. The office of ban was revived, and its holder, Baron Levin Rauch, was an ardent Magyars. At the elections of December 1867 a majority of Hungarian partisans was easily obtained, and on the 26th of January the diet passed a resolution in favour of reunion with Hungary. The whole Opposition refused to take any part in the proceedings, as a protest against the alleged illegality of the elections; but by the 25th of June the Croatian commissioners and the Hungarian government had framed a new constitution, which was ratified in September. Besides substituting Hungarian for Austrian sovereignty, it provided that the diet and the ban should control local affairs, subject to the Croatian minister in the Hungarian cabinet, and that Croatia-Slavonia should pay 50% of its revenue to Hungary for mutual and imperial expenses, but should be represented in the Hungarian parliament by thirty-six delegates, and should continue to use Serbo-Croatian as the official language. Hungary guaranteed that the 45% retained by the territorial government should be less than two and a half million gulden (£250,000).
CROATIA-SLAVONIA

In May 1870 Fiume was annexed to Hungary, but in 1873 the Croats received as compensation an increase of their guaranteed revenue to £150,000, an addition of seven to the number of their representatives at Budapest, and a promise that the military frontier should be incorporated in the existing civil provinces. In 1877 a convention with Hungary regulated the control of public estates in the military frontier, and on the 15th of July 1881 the frontier, including the district of Sichelburg claimed by Carniola, was handed over to the local administration.

Meanwhile the events of 1875-1878 in the Balkans, culminating in the Austrian occupation of Bosnia and Herzegovina, revived the agitation for a “Great Croatia.” A party separate from the regular Opposition, and known as the “Party of the Right,” was formed to oppose the Magyars. Its activity resulted in the riots of 1883, which were with difficulty quelled; in 1885 its leader, N. Starčević, was condemned to imprisonment for the violence of his speeches against the ban, Count Khuen-Hédervár. In 1888 the moderate Opposition also lost its leader, Bishop Strossmayer, who was censured by the king on account of his famous Pan-Slavist telegram to the Russian Church (see Notes on Books). In 1888, the financial agreement between Croatia and Hungary was revised and the contribution of Croatia-Slavonia to the expenses shared with Hungary or common to the whole of the Dual Monarchy was raised by 1%. This added burden combined with bad harvests, a fall in the revenue and a deficit in the budget to heighten popular discontent. Count Khuen-Hédervár was responsible for several administrative improvements, but the prosperity of the country declined from year to year. The government was accused of illegal interference with the elections, with the use of the Hungarian arms and language in official documents, and with undue harshness in the censorship of the press. In May 1903 there were outbreaks of rioting in Agram, Sisack and other towns, besides serious agrarian disturbances directed against the Magyarland owners; in a debate in the Reichsrath (15th May) an Austrian deputy named Bianchini unsuccessfully attempted to induce the imperial government to intervene. At the end of June Count Khuen-Hédervár was made Hungarian prime minister; Count T. Pejačević succeeded him as ban, and restored quiet by promising freedom of assembly and greater liberty of the press. Since 1898 the financial agreement had only been renewed from year to year. But the estimates for 1904 revealed another heavy deficit; and this was only paid by Hungary on condition that the agreement should be renewed until the 31st of December 1913, and the contribution of 5% maintained.

The constitutional crisis of 1905 in Hungary stimulated the nationalistic agitation. A congress of Croatian and Dalmatian deputies met at Spalato to advocate Serbo-Croatian unity, and in 1906 the municipality of Agram endeavoured to petition the king in favour of union with Bosnia and Herzegovina. This propaganda was severely discouraged. Baron Rauch, appointed ban in 1906, refused to summon the diet, in which he could not command a single vote, and much excitement was caused in 1909 by the trial of 37 nationalist leaders for high treason. The policy of the nationalists, who now aimed at the political union, under the king-emperor, of all Serbo-Croats in Austria-Hungary—upwards of 4,500,000—was less visionary than the older Illyrians, and less aggressively Pan-Slavist. It no longer sought to include Carniola, and the abolition of the Croatian-Slavonian language in the proposed “Great Croatia.” It was opposed by Austria and Hungary as a menace to Magyar predominance in Transleithania.

Language and Literature.

For the place of the Croatian dialects among Slavonic languages generally, see SLAVS. The Croatian dialects, like the Servian, have gradually developed from the Old Slavonic, which survives in medieval liturgies and biblical and apocryphal writings. The course of this development was similar in both cases, except that the Croats, owing to their dependence on Austria-Hungary, were not so deeply influenced as the Serbs by Byzantine culture in the middle ages, and by Russian linguistic forms and Russian ideas in modern times. The Orthodox Serbs, moreover, use a modified form of the Cyrillic alphabet, while the Roman Catholic Croats use Latin characters, except in a few liturgical books which are written in the ancient Glagolitic script. As the literary language of both nations is now practically the same, and is, indeed, commonly known as “Serbo-Croatian,” the reader may be referred to the article Servia: Language and Literature, for an account of its history, of its chief literary monuments up to the 10th century and inclusive of Dalmatian literature, and of the principal differences between the dialects spoken in Servia and Croatia-Slavonia.

The three most important Croatian dialects are known as the Čakavić, Čakavština or, in Servian, Chakanski, spoken along the Adriatic littoral; the Štokavić (Štokavština, Štokanski), spoken in Servia and elsewhere in the north-west of the Balkan Peninsula; and the Kajkavci (Kajkavština, Kaykanski), spoken by the partly Servian population of the districts of Agram, Warasdin and Kreuz. This classification is based on the form, varying in different localities, of the pronoun te, te, or kaj, meaning “what.”

The Čakavština literature includes most of the works of the Dalmatian writers of the 15th and 16th centuries—the golden age of Serbo-Croatian literature. Its history is indissolubly intertwined with that of the Štokavić, which ultimately superseded it, and became the literary language of all the SerboCroats, as it had long been the language of the best national ballads and legends.

Kajkavština had from about 1550 to 1830 a distinctive literature, consisting of chronicles and histories, histories, poems, a religious or educational character, fables and moral tales. These writings possess more philological interest than literary merit, and are hardly known outside Croatia-Slavonia and the Slovene districts of Austria.

Apart from the Kajkavci dialect, the whole body of Serbo-Croatian literature up to the 19th century may justly be regarded as the common heritage of Serbs and Croats. The linguistic and literary reforms which Dossitej Obradovich and Vuk Stefanovich Kanačić carried out in Servia about the close of this period helped to stimulate among the Croats a new interest in their national history, their traditions, folk-songs and folk-tales. One result of this nationalistic revival was the abortive attempt made between 1814 and 1830 to raise the Čakavština dialect to the rank of a distinctive literary language for Croatia-Slavonia; but the Illyrian movement of 1840 led to the adoption of the Štokavić, which was already the vernacular of the majority of Serbo-Croats. Ljudevit Gaj (1800-1872), though he failed to create an artificial literary language by the fusion of the principal dialects spoken by Serbs, Croats and Slovenes, was by his championship of Illyrian instrumental in securing the triumph of the Štokavić. Gaj was a poet of considerable talent, and one of the founders of Croatian journalism. Among other writers of the first half of the 19th century may be mentioned Ivan Mažuranić (1815-1860), whose first poems were published in the Danská Větra (“Illyrian Dawnstar”), a journal founded and for a time edited by Gaj. In 1849 Mažuranić published his Smrt Smrte Aga Čengića (“Death of Ismail Aga Čengić”), called by the Serbo-Croats the “Epos of Hate.” This remarkable poem, written in the metre of the old Servian ballads, gives a vivid description of life in Bosnia under Turkish rule, and of the hereditary border feuds between Christians and Moslems. In later life Mažuranić distinguished himself as a statesman, and became ban of Croatia from 1873 to 1880. Other writers representative of Croatian literature before 1867 were the lyric poet Stanko Vrač (1850-1851) and Dragutin Rakovac (1813-1854), the author of many patriotic songs.

With the foundation of the South Slavonic Academy at Agram, in 1867, the study of science and history received a new impetus. Under the presidency of Franko Rački (1854-1904) the academy, with its journal the Rad Jugoslovenske Akademije, became the headquarters of an active group of savants, among whom may be mentioned Vlastrošlag Jagić (b. 1838), sometime editor of the
CROCIDOLITE—CROCKFORD

Another alteration product of the crocidolite, consisting of silica and ferric hydrate, has been called griqualandite. Crocidolite and the minerals resulting from its alteration occur in seams, associated with magnetite and other iron-ores, in the jasper-slates of the Anmyras Mountains in Griqualand West, Cape Colony. It is known also from a few other localities, but only in subordinate quantity. (See Cat's-Eye.)

CROCKET (Ital. uncinato, Fr. crocket, crosse, Ger. Häbelknopf, Knollen), in architecture, an ornament running up the sides of gables, hood-moulds, pinnacles, spires; generally a winding stem like a creeping plant, with flowers or leaves projecting at intervals, and terminating in a filial.

CROCKETT, DAVID (1786-1836), American frontiersman, was born in Greene county, Tennessee, on the 17th of August 1786. His education was obtained chiefly in the rough school of experience in the Tennessee backwoods, where he acquired a wide reputation as a hunter, trapper and marksman. In 1813-1814 he served in the Creek War under Andrew Jackson, and subsequently became a colonel in the Tennessee militia. In 1821-1824 he was a member of the state legislature, having won his election not by political speeches but by telling stories. In 1827 he was elected to the national House of Representatives as a Jackson Democrat, and was re-elected in 1829. At Washington his shrewdness, eccentric manners and peculiar wit made him a conspicuous figure, but he was too independent to be a supporter of all Jackson’s measures, and was opposed by the president’s Indian policy led to administration influences being turned against him with the result that he was defeated for re-election in 1831. He was again elected in 1835, but in 1835 lost his seat a second time, being then a vigorous opponent of many distinctively Jacksonian measures. Discouraged and disgusted, he left his native state, and emigrated to Texas, then engaged in its struggle for independence. There he lost his life as one of the defenders of the Alamo at San Antonio on the 6th of March 1836.

A so-called “autobiography,” which he very probably dictated or at least authorized, was published in Philadelphia in 1834; a work purporting to be a continuation of this autobiography and entitled Colonel Crockett’s Exploits and Adventures in Texas (Philadelphia, 1836) is undoubtedly spurious. These two works were subsequently combined in a single volume, of which there have been numerous later editions. Numerous popular biographies have been written, the best by E. S. Ellis (Philadelphia, 1884).

CROCKETT, SAMUEL RUTHERFORD (1866— ), Scottish novelist, was born at Dunches, Galloway, on the 24th of September 1866, the son of a Galloway farmer. He was brought up on a Galloway farm, and graduated from Edinburgh University in 1879. After some years of travel he became in 1886 minister of Penicuik, but eventually abandoned the Free Church ministry for novel-writing. The success of Mr J. M. Barrie had created a demand for stories in the Scottish dialect when Mr Crockett published his successful story of The Stickit Minister in 1893. It was followed by a rapidly produced series of popular novels dealing often with the past history of Scotland, or with his native Galloway. Such are The Raiders, The Lilac Sunbonnet and Mad Sir Uchter in 1894; The Men of the Moss Hags in 1895; Cleg Kelly and The Grey Man in 1896; The Surprising Adventures of Sir Toddy Lion (1897); The Red Axe (1898); Kit Kennedy (1899); Joan of the Sword Hand and Little Anna Mark in 1900; Fower o’ the Corn (1902); Red Cap Tales (1904), &c.

CROCKFORD, WILLIAM (1775-1844), proprietor of Crockford’s Club, was born in London in 1775, the son of a fishmonger, and for some time his father carried on that business. After winning a large sum of money according to one story £10,000—either at cards or by running a gambling establishment, he built, in 1827, a luxurious gambling house at 50 St James’s Street, which, to ensure exclusiveness, he organized as a club. Crockford’s quickly became the rage; every English social celebrity and every distinguished foreigner visiting London hastened to become a member. Even the duke of Wellington joined, though, it is averred, only in order to be able to blackball his son, Lord Douro, should he seek election. Hazard was the favourite game, and very large sums changed hands. Crockford

Archiv für slavische Philologie; the historians Sime Ljubič (1822-1886) and Vjekoslav Klaic, author of several standard works on Croatia and the Croats; the dramatist Alphonoz Sulek (1816-1895); the ethnographer and philologist Marko Karelac (1811-1874). In Dalmatia, where the Ragusan journal Slavina has served, like the Agrad Rad, as a focus of literary activity, there have been numerous poets and prose writers, associated, in many cases, with the Illyrist or the nationalist propaganda. Among these may be mentioned Count Medo Pučić (1821-1882), and the dramatist Matija Ban (1818-1903), whose tragedy Meyrimah is considered by many the finest dramatic poem in the Serbo-Croatian language.

Uhlig (Leipzig, 1903); Die drei Ungarische Monarchie in Wort und Bild, vol. iv., edited by J. von Weilen (Vienna, 1902); Führer durch Ungarn, Kroaten und Slawonien, by B. Alföldi (Vienna, 1900); Reiseführer durch Kroaten und Slawonien, by A. Lukšić (Agram, 1893); Vegetationsarkivnosti von Kroaten, by A. Nellroth (Vienna, 1868); “Die Slowenen,” by J. Sumian, and “Die Kroaten,” by F. Starc, in vol. x. of Die Völker Oesterreichs-Ungarns (Vienna, 1881-1882); Die Serbokroaten der adriatischen Küstenland, by A. Weissbach (Berlin, 1881); and the map Zemljoprodj Hrvatskih Slavonja, by M. Kukuljević (1884). The on the detailed history of one in Serbo-Croatian, written by a succession of the highest native authorities, and published by the South Slavonic Academy (Agram, from 1881). It is largely based on the following works: Vetera monumetum historiae Slavorum meridionalium illustrata, published by the South Slavonic Academy (Agram, 1863, &c.); Iura regni Croatica, Dalmatiae, et Sloveniae cum privilegios, by j. Kukuljević (Agram, 1861-1862); Monumenta historiae Slavorum meridionalium, by V. Makushev, in Latin and Italian, with notes in Slavonic (Belgrade, 1885); De regno Dalmatiae et Croato, by G. Lucido (Amsterdam, 1666; see Dalmatia, under bibliography); Regno degli Slavi, by M. Orbin (Pesaro, 1601); and, for ecclesiastical history, Illyricum sacrum, by D. Farlatius and others (Venice, 1751-1819). See also Hrvatska i Hrati, by V. Klaic (Agram, 1875-1877, &c.); and Slawonien vom 10. bis zum 13. Jahrhundert, translated from the Serbo-Croatian of Klaic by J. von Weilen (Agram, 1882). (K. G. J.)

CROCIDOLITE, a mineral described in 1815 by M. H. Klaproth under the name Blausenstein (blue ironstone), and in 1831 by J. F. Hausmann, who gave it its specific name, from its nap-like appearance (Gr. κρόκος, nap, cloth). It is a blue fibrous mineral belonging to the amphibole group and closely related to riebeckite; chemically it is an iron sulfate dioxide. Its resemblance to asbestos has gained for it the name Cape Asbestos, the chief occurrence being in Cape Colony. The mineral suffers alteration by removal of alkali and peroxidation of the ferrous iron, and further by deposition of silica between the fibres, or by their replacement by silica; a hard siliceous mineral is thus formed which when polished shows, in consequence of its fibrous structure, a beautiful chatoyancy or silky lustre. This is the ornamental stone which is known when blue as “hawk's-eye,” and when of rich golden brown colour as “tiger-eye.” The latter, which represents the final alteration of the crocidolite, has become very fashionable as “South African cat’s eye,” and is often termed “crocidolite,” though practically only a mixture of quartz with brown oxide of iron. The following are analyses by A. Renard and C. Klement of the unaltered crocidolite and of the blue and brown products of alteration:-

Further information on crocidolite can be found in the textbooks of mineralogy.
CRUCIDILE

CROCODILE, a name for certain reptiles, taken from ancient Gr. κορόδελος, signifying lizard and newt; with reduplication κοροδελίδος, and by metathesis ultimately κροκοδέλος. Herodotus makes mention of them, and tells us that the Egyptian name was champsis. The Arabic term is ledscham. The same root kar leads through something like kar-kar-ta, glakarta (glazurd in Breton), to lacerta and to "lizard." Lacerta in turn has become, in Spanish, lagarto, which, with the article, el lagarto, is the origin of the term "alligator." This word is, however, artificial, although now widely used; Spanish and Portuguese-speaking people in America universally call the crocodile and the alligator simply lagarto, which is never intended for lizard.

The Crocodylia form a separate order of reptiles with many peculiarities. The premaxillae are short and always enclose the nostrils. The upper jaw is protractile, and the front teeth of the upper jaw generally open far behind in the roof of the mouth, in recent forms within the pterygoids. The under jaws are hinged on to the quadrate bones, which extend obliquely backwards, and are immovably wedged in between the squamosal and the lateral occipital wings. The teeth form a complete series in the under jaw, and in the upper jaw on the premaxilla and maxillary bones. They are conical and deeply implanted in separate sockets. They are often shed throughout life, the successors lying on the inner side, and with their caps partly fitting into the wide open roots of the older teeth. Especially in alligators the upper teeth overlap laterally those of the lower jaw, whilst in most crocodiles the overlapping is less marked and the teeth mostly interlock, a feature which increases with the slenderness of the snout. In old specimens some of the longer, lower teeth work their tips into deep pits, and ultimately even perforate the corresponding parts of the upper jaw. The first and second vertebrae each have a pair of long, movable ribs. There is a compound abdominal sternum. The so-called pubic bones are large and movable. There are five fingers and four toes, provided with claws, excepting the outer digits.

The tongue is flat and thick, attached by its whole under surface; its hinder margin is raised into a transverse fold, which, by meeting a similar fold from the palate, can shut off the mouth completely from the wide cavity of the throat. Dorsally the posterior nares open into this cavity. Consequently the beast can lie submerged in the water, with only the nostrils exposed, and with the mouth open, and breathe without water entering the windpipe. Within the glottis is a pair of membranous folds which serve as vocal cords; all the Crocodylia are possessed of a loud, bellowing voice.

The stomach is globular, rather muscular, with a pair of tendinous centres like those of birds; its size is comparatively small, but the digestion is so rapid and powerful that every bone of the creature's prey is dissolved whilst still being stowed away in the wide and long gullet. The anal opening forms a longitudinal slit; within it, arising from its anterior corners, is an unpaired copulatory organ. The vascular system has attained the highest state of development of all reptiles. The heart is practically quadrilocular, the right and left halves being completely partitioned, except for a small communication, the foramen Panisumse, between the right and left aortae where these cross each other on leaving their respective ventricles. The outer ear lies in a recess which can be closed tightly by a dorsal flap of skin. The power of hearing is acute, and so is the sight, the eyes being protected by upper and lower lids and by a nictitating membrane. The skin of the whole body is scaly, with a hard, horny, waterproof covering of the epidermis, but between these mostly flat scales the skin is soft. The scutes or dermal portions of the scales are more or less ossified, especially on the back, and form the characteristic dermal armour. The skins or "hides" of commerce consist entirely of the cutis minus, the epidermis and the horny coverings of the scutes. All the Crocodylia possess two pairs of musk-glands in the skin; one is situated on the inner side of the lower jaw. The opening of the glands is slit-like and leads into a pocket, which is filled with a smerey, strongly scented matter. The other pair lies just within the lips of the cloacal opening.

Propagation takes place by eggs, which are oval, quite white, with a very hard and strong shell. Their size varies from 2 to 4 in. in length, according to the size of the species and the age of the female. She lays several dozen eggs in a carefully prepared nest. The Nile crocodile makes a hole in white sand, which is then filled up and smoothed over; the mother sleeps upon the nest, and keeps watch over her eggs, and when these are near hatching—after about twelve weeks—she removes the 15 in. or 2 ft. of sand. Other species, especially the alligators, make a very large nest of leaves, twigs and humus, scraping together a mound about a yard high and two or more yards in diameter. The eggs, in several layers, are laid near the top. The adults frequently dig long subterranean passages into the banks of streams, and, during dry seasons, they have been found deep in the subterranean moll, whence they emerge with the beginning of the rains. They spend most of their time in the water, but are also very fond of basking in the hot sun on the banks of rivers or in marshes, usually with the head turned towards the water, to which they take on the slightest alarm. They can walk perfectly well, and they do so deliberately with the whole body raised a little above the ground. When their pools dry up, or when in search of new hunting-grounds, they sometimes undertake long wanderings over land. But the water is their true element. They swim rapidly, propelled by the powerful tail and by the mostly webbed limbs, or they submerge themselves, with only the tip of the nose and the eyes showing, or sometimes also the back. They then look like floating logs; and thus they float or gently approach their prey, which consists of anything they can overpower. Many a large mammal coming to drink at its accustomed place is dragged into the water by the lurking monster. Certainly there are occasional man-eaters amongst them, and in some countries they are much feared. As a rule, however, they are so wary and suspicious that they are very difficult to approach, and their haunts are so well stocked with fish and other game that they make off and hide rather than attack a man swimming in their waters. But if a dog is sent in there will be a sudden yelp, the splash from a big tail, and a widening eddy.

Crocodyl stories, not all fabulous, are plentiful, and begin with one of the oldest writings in the world, the book of Job. "Canst thou draw leviathan with a hook? or his tongue with a cord which thou listest down? . . . Lay thine hand upon him, remember the battle, do no more." This is a very interesting passage, since it can apply only to a large-sized crocodile. Now nothing is known of the occurrence of such in Arabia, but a few specimens of rather small size seem still to exist in Syria, in the Wadi Zerka, an eastern tributary of the Jordan.

Crocodiles are caught in various ways,—for instance, with two pointed sticks, which are fastened crosswise within the bait, an animal's entrails, to which is attached a rope. When the creature has swallowed the spiked bait it keeps its jaws so firmly closed that it can be dragged out of the water. A kind of plow, Plagiapthous aegyptius, often sits upon basking crocodiles, and, since the latter often rest with gaping mouth, it is possible that these agile birds do pick the reptiles' teeth in search of parasites. Being a very watchful bird, its cry of warning, when it flies off on the approach of danger, is probably appreciated by the crocodile. But the story of the ichneumon or mongoose is a fable. Although an inveterate destroyer of eggs, this little creature prefers those of birds and the soft-shelled eggs of lizards to the very hard and strong-shelled eggs which are deeply buried in the crocodile's nest.

Considering the interest which is taken in crocodiles and their allies, on account of their size, their dangerous nature and the sporting trophies which they yield, the following "key," based upon easily ascertained characters of the skull, is given.
I. Snout very long and slender. The mandibular symphysis extends backwards at least to the fifteenth tooth.

(a) Nasal bones very small, and widely separated from the premaxilla (which encloses the nostrils) by the maxillaries which join each other for a long distance along the midline. *Gavialis gangeticus* of India, the "gharial" or fish-eater.

(b) Nasal bones long, so as to be in contact with the premaxilla at the hinder corner of the nostril groove. *Tomistoma schlegeli* of Borneo, Malacca and Sumatra.

II. Snout mostly triangular or rounded off. The mandibular symphysis does not reach beyond the eighth tooth.

(a) The fourth mandibular tooth fits into a notch in the upper jaw. Crocodiles.

1. Without a bony nasal septum between the nostrils. *Crocodiles*.

2. The nasal bones project through the nasal groove, forming a bony septum. *Osteolaemus frontatus s. tetraspis* of West Africa.

(b) Fourth mandibular tooth fitting into a pit in the upper jaw. Alligators.

1. Without a bony nasal septum... *Caiman*, Central and South America.

2. Nasal bones dividing the nasal groove... *Alligator sinuor*, America and China.

The genus *Crocodilus* contains seven species. *C. vulgaris* or *niloticus* of most of Africa, is found from the Senegal to Egypt and to Madagascar, reaching a length of 15 ft. It has eighteen or nineteen upper and fifteen lower teeth on each side. *C. palustris*, the "mugger" or "marsh crocodile" of India and Ceylon, extends westwards into Baluchistan, eastwards into the Malayan islands. It has nineteen upper and lower teeth on either side. The scutes on the neck, six in number, are packed closely together, the four biggest forming a square. The length of 12 ft. is a fair size for a large specimen. *C. porosus* or *biporatus* is easily recognised by the prominent longitudinal ridge which extends in front of each eye. Specimens of more than 20 ft. in length are not uncommon, and a monster of 33 ft. is on record. It is essentially an inhabitant of tidal waters and estuaries, and often goes out to sea; hence its wide distribution, from the whole coast of Bengal to southern China, to the northern coasts of Australia and even to the Fiji islands. Australians are in the habit of calling their crocodiles alligators. *C. cau- paractus* is the common crocodile of West Africa, easily recognised by the slender snout which resembles that of the gavial, but the mandibular symphysis does not reach beyond the eighth tooth. *C. johnstoni* of northern Australia and Queensland, is allied to the last species mentioned, with which it agrees by the slender snout. Lastly there are two species of true crocodiles in America, *C. intermedius* of the Orinoco, allied to the former, and *C. americanus* or *acutus* of the West Indies, Mexico, Central America to Venezuela and Ecuador; its characteristic feature is a median ridge or swelling on the snout, which is rather slender.

The above list shows that the usual statement that crocodiles inhabit the Old World and alligators the New World is not strictly true. In the Tertiary epoch alligators, crocodiles and long-nosed gavials existed in Europe. (H. F. G.)

CROCOITE, a mineral consisting of lead chromate, PbCrO₄, and crystallizing in the monoclinic system. It is sometimes used as a paint, being identical in composition with the artificial product chrome-yellow; it is the only chromate of any importance found in nature. It was discovered at Berezovsk near Ekaterinburg in the Urals in 1856, and named crocoite by F. S. Beudant in 1832, from the Greek κρόκος, saffron, in allusion to its colour, a name first altered to crocoite and afterwards to crocoite. It is found as well-developed crystals of a bright hyacinth-red colour, which are translucent and have an adamantine to vitreous lustre. On exposure to light much of the translucency and brilliancy is lost. The streak is orange-yellow; hardness 2½-3½; specific gravity 6.0. In the Urals the crystals are found in quartz-veins traversing granite or gneiss; other localities which have yielded good crystallized specimens are Congonhas do Campo near Ouro Preto in Brazil, Luzon in the Philippines, and Umtali in Mashonaland. Gold is often found associated with this mineral. Crystals far surpassing in beauty any previously known have been found in the Adelaide Mine at Dundas, Tasmania; they are long slender prisms, 3 or 4 in. in length, with a brilliant lustre and colour.

Associated with crocoite at Berezovsk are the closely allied minerals phoenicochroite and vaquenellite. The former is a basic lead chromate, Pb₃CrO₄, and the latter a lead and copper phosphate-chromate, 2(Pb,Cu)₃CrO₄(Pb,Cu)₂(PO₄)₃. Vaquenellite forms brown or green monoclinic crystals, and was named after L. N. Vaquelin, who in 1797 discovered (simultaneously with and independently of M. H. Klaproth) the element chromium in crocoite. (L. J. S.)

CROCUS, a botanical genus of the natural order Iridaceae, containing about 70 species, natives of Europe, North Africa, and temperate Asia, and especially developed in the dry country of south-eastern Europe and western and central Asia. The plants are admirably adapted for climates in which a season favourable to growth alternates with a hot or dry season; during the latter they remain dormant beneath the ground in the form of a short thickened stem protected by the scaly remains of the bases of last season's leaves (known botanically as a "corm"). At the beginning of the new season of growth, new flower- and leaf-bearing shoots are developed from the corm at the expense of the food-stuff stored within it. New corms are produced at the end of the season, and by these the plant is multiplied.

These crocuses of the flower garden are mostly horticultural varieties of *C. vernus*, *C. persicolor* and *C. aureus* (Dutch crocus), the two former yielding the white, purple and striped, and the latter the yellow varieties. The corms succeed in any fairly good garden soil, and is usually planted near the edges of beds or borders in the flower garden, or in broad-based patches at intervals along the mixed borders. The corms should be planted 3 in. below the surface, and as they become crowded they should be taken up and replanted with a refreshment of the soil, at least every five or six years. Crocuses have also a pleasing effect when dotted about on the lawns and grassy banks of the pleasure ground.

Some of the best of the varieties are:—Purple: David Rizziol, Sir J. Franklin, purpureus grandiflorus. Striped: Albion, La Majestueuse, Sir Walter Scott, Cloth of Silver, Mme Mina. White: Caroline Chisholm, Mont Blanc. Yellow: Large Dutch. These species of crocus are not very robustly marked, by those who make a specialty of hardy bulbs ought certainly to search them out and grow them. They require the same culture as the more familiar garden varieties; but, as some of them are apt to suffer from excess of moisture, it is advisable to plant them in prepared soil in a raised pit, where they are brought nearer to the eye, and where they can be sheltered when necessary by glazed sashes, which, however, should not be closed except when the plants are at rest, or during inclement weather in order to protect the blossoms, especially in the case of winter flowering species. The autumn blooming kinds include many plants of very great beauty. The following species are recommended—

Winter flowering:—*C. hyemalis*, laevigati, vellulinos. CROCOUS, last king of Lydia, of the Mermnad dynasty, (560-546 B.C.), succeeded his father Alyattes after a war with his half-brother. He completed the conquest of Ionia by capturing Ephesus, Miletus and other places, and extended the Lydian empire as far as the Halys. His wealth, due to trade, was proverbial, and he used part of it in securing alliances with the Greek states whose fleets might supplement his own army. Various legends were told about him by the Greeks, one of the most famous being that of Solon's visit to him with the lesson
it conveyed of the divinity nemesis which waits upon overmuch prosperity (Hdt. i. 29 seq.; but see Solos). After the overthrow of the Median empire (546 B.C.) Croesus found himself confronted by the rising power of Cyrus, and along with Nabonidos of Babylon took measures to resist it. A coalition was formed between the Lydian and Babylonian kings, Egypt promised troops and Sparta its fleet. But the coalition was defeated by the rapid movements of Cyrus and the treachery of Eurybatus of Ephesus, who fled to Persia with the gold that had been entrusted to him, and betrayed the plans of the confederates. Fortified with the Delphic oracles Croesus marched to the frontier of his empire, but after some initial successes fortune turned against him and he was forced to retreat to Sardis. Here he was followed by Cyrus who took the city by storm. We may gather from the recently discovered poem of Bacchylides (iii. 23-52) that he hoped to escape his conqueror by burning himself with his wealth on a funeral pyre, like Saracus, the last king of Assyria, but that he fell into the hands of Cyrus before he could effect his purpose.  

A different version of the story is given (from Lydian sources) by Herodotus (followed by Xenophen), who makes Cyrus offer to burn Croesus and to build him a new city. This version is nearer to the actual distant under the Persian rule. Croesus, however, was dragged to Babylon, where he fell into the hands of a tyrant whose name hardly consistent with the Persian reverence for fire. Apollo, however, came to the rescue of his pious worshipper, and the name of Solon uttered by Croesus resulted in his deliverance. According to Ctesias, who uses Persian sources, and says nothing of the attempt to burn Croesus, he subsequently became attached to the court of Cyrus and received the governorship of Barene in Media. Fragments of columns from the temple of Artemis now in the British Museum have upon them a dedication by Croesus in Greek.

See R. Schubert, De Croeso et Solone fabula (1668); M. G. Radet, La Lydie et le monde grec au temps des tyrannes (1892-1893); A. S. Murray, Journ. H. Stud. x. s. pp. 1-10 (1889); for the supposition that Croesus did actually perish on his own pyre see G. B. Grundy, Great Persian War, p. 28; Grote, Hist. of Greece (ed. 1907), p. 104. Cf. CYRUS; LYDIA.

CROFT, SIR HERBERT, Bart. (1751-1816), English author, was born at Dunster Park, Berks, on the 1st of November 1751, son of Herbert Croft (see below) of Stifford, Essex. He matriculated at University College, Oxford, in March 1771, and was subsequently entered at Lincoln's Inn. He was called to the bar, but in 1782 returned to Oxford with a view to preparing for holy orders. In 1786 he received the vicarage of Pittlewell, Essex, but he remained at Oxford for some years accumulating materials for a proposed English dictionary. He was twice married, and on the day after his second wedding day he was imprisoned at Exeter for debt. He then retired to Hamburg, and two years later his library was sold. He had succeeded in 1797 to the title, but not to the estates, of a distant cousin, Sir John Croft, the fourth baronet. He returned to England in 1800, but went abroad once more in 1802. He lived near Amiens at a house owned by Lady Mary Hamilton, said to have been a daughter of the earl of Leven and Melville. Later he removed to Paris, where he died on the 26th of April 1816. In some of his writings makes Cyrus-type on his prison here.

Charles J. Croft, brother of the above, wrote the Life of Edward Young inserted in Johnson's Lives of the Poets. In 1758 he published Love and Madness, a Story too true, in a series of letters between Parties whose names could perhaps been mentioned were they less known or less lamented. This book, which passed through seven editions, narrates the passion of a clergyman named James Hackman for Martha Ray, mistress of the earl of Sandwich, who was shot by her lover as she was leaving Covent Garden in 1779 (see the Case and Memoirs of the late Rev. Mr James Hackman, 1779). Love and Madness has permanent interest because Croft inserted, among other miscellaneous matter, information about Thomas Chatterton gained from letters which he obtained from the poet's sister, Mrs Newton, under false pretences, and used without payment. Robert Southey, when about to publish an edtion of Chatterton's works for the benefit of his family, published (November 1799) details of Croft's proceedings in the Monthly Review. To this attack Croft wrote a reply addressed to John Nichols in the Gentleman's Magazine, and afterwards printed separately as Chatterton and Love and Madness (1800). This tract evades the main accusation, and contains much abuse of Southey. Croft, however, supplied the material for the exhaustive account of Chatterton in A. Kippis's Biographia Britannica (vol. iv., 1798). In 1788 he addressed a letter to William Pitt on the subject of a new dictionary. He criticized Samuel Johnson's efforts, and in 1790 he claimed to have collected 11,000 words used by excellent authorities but omitted by Johnson. Two years later he issued proposals for a revised edition of Johnson's Dictionary, but subscribers were lacking and his 200 vols. of MS. remained unused. Croft was a good scholar and linguist, and the author of some curious books in French.

The Love Letters of Mr H. and Miss R. 1777-1779 were edited from Croft's book by Mr Gilbert Bawden (1855). See also John Nichols's Illustrations (1828), v. 202-218.

CROFT, SIR JAMES (d. 1590), lord deputy of Ireland, belonged to an old family of Herefordshire, which county he represented in parliament in 1541. He was made governor of Haddington in 1549, and became lord deputy of Ireland in 1551. There he effected little beyond gaining for himself the reputation of a conciliatory disposition. Croft was all his life a double-dealer. He was imprisoned in the Tower for treason in the reign of Mary, but was released and treated with consideration by Elizabeth after her accession. He was made governor of Berwick, where he was visited by John Knox in 1559, and where he busied himself actively on behalf of the Scottish Protestants, though in 1560 he was said to be in the cause of the Catholic party, in reason of treatable correspondence with Mary of Guise, the Catholic regent of Scotland; and for ten years he was out of public employment. But in 1570 Elizabeth, who showed the greatest forbearance and favour to Sir James Croft, made him a privy councillor and controller of her household. He was one of the commissioners for the trial of Mary queen of Scots, and in 1588 was sent on a diplomatic mission to arrange peace with the duke of Parma. Croft established private relations with Parma, for which on his return he was sent to the Tower. He was released before the end of 1589, and died on the 4th of September 1590.

Croft's eldest son, Edward, was put on his trial in 1589 on the curious charge of having contrived the death of the earl of Leicester by witchcraft, in revenge for the earl's supposed hostility to Sir James Croft. Edward Croft was father of Sir Herbert Croft (d. 1622), who became a Roman Catholic and wrote several controversial pieces in defence of that faith. His son Herbert Croft (1600-1691), bishop of Hereford, after being for some time, like his father, a member of the Roman church, returned to the church of England and was bishop of Salisbury in 1660, and about ten years later was chaplain to Charles I., and obtained within a few years a prebend's stall at Worcester, a canonry of Windsor, and the deanery of Hereford, all of which preemptions he lost during the Civil War and Commonwealth. By Charles II. he was made bishop of Hereford in 1661. Bishop Croft was the author of many books and pamphlets, several of them against the Roman Catholics; and one of his works, entitled The Naked Truth, or the True State of the Primitive Church (London, 1675), was very celebrated in its day, and gave rise to prolonged controversy. The bishop died in 1691. His son Herbert was created a baronet in 1671, and was the ancestor of Sir Herbert Croft (q.v.), the 18th century writer.

CROFT (or CROFTS), WILLIAM (1678-1727), English composer, was born in 1678, at Nether Ettington in Warwickshire. He received his musical education in the Chapel Royal under Dr Blow. He early obtained the place of organist of St Anne's, Soho, and in 1700 was admitted a gentleman extraordinary of the Chapel Royal.
Royal. In 1707 he was appointed joint-organist with Blow; and upon the death of the latter in 1708 he became solo organist, and in 1712 director of the children and composer of the Chapel Royal, besides being made organist of Westminster Abbey. In 1712 he wrote a brief introduction on the history of English church music to a collection of the words of anthems which he had edited under the title of Divine Harmony. In 1733 he obtained his degree of doctor of music in the university of Oxford. In 1724 he published an edition of his choral music in 2 vols. folio, under the name of Musica Sacra, or Select Anthems in score, for two, three, four, five, six, seven and eight voices, to which is added the Burial Service, as it is occasionally performed in Westminster Abbey. This handsome work included a portrait of the composer and was the first of the kind executed on pewter plates and in score. John Page, in his Harmonia Sacra, published in 1800 in 3 vols. folio, gives seven of Croft’s anthems. Of instrumental music, Croft published six sets of airs for two violins and a bass, six sonatas for two flutes, six solos for a flute and bass. He died at Bath on the 14th of August 1727, and was buried in the north aisle of Westminster Abbey, where a monument was erected to his memory by his friend and admirer Humphrey Wreyly Birch. Burney in his History of Music devotes several pages of his third volume (pp. 603-612) to Dr Croft’s life, and criticisms of some of his anthems. During the earlier period of his life Croft wrote much for the theatre, including overtures and incidental music for Courtship à la mode (1700), The Funeral (1702) and The Lying Lover (1703).

CROFTER—CROKER, R.

CROFTER, a term used, more particularly in the Highlands and islands of Scotland, to designate a tenant who rents and cultivates a small holding of land or “crott.” This Old English word, meaning originally an enclosed field, seems to correspond to the Dutch kroft, a field on high ground or downs. The ultimate origin is unknown. By the Crofters’ Holdings (Scotland) Act 1886, a crofter is defined as the tenant of a holding who resides on his holding, the annual rent of which does not exceed £50 in money, and which is let to him for agricultural purposes. The whole number of tenants from their crofts during the 19th century, in violation of, as the tenants claimed, an implied security of tenure, has led in the past to much agitation on the part of the crofters to secure consideration of their grievances. They have been the subject of royal commissions and of considerable legislation, but the effect of the Crofters Act of 1886, with subsequent amending acts, has been to improve their condition markedly, and much of the agitation has now died out. A history of the legislation dealing with the crofters is given in the article Scotland.

CROKER, JOHN WILLSON (1780–1857), British statesman and author, was born at Galway on the 20th of December 1780, being the only son of John Croker, the surveyor-general of customs and excise in Ireland. He was educated at Trinity College, Dublin, where he graduated in 1800. Immediately afterwards he was entered at Lincoln’s Inn, and in 1802 he was called to the Irish bar. His interest in the French Revolution led him to collect a large number of valuable documents on the subject, which are now in the British Museum. In 1804 he published anonymously Familiar Epistles to J. F. Jones, Esquire, on the State of the Irish Stage, a series of caustic criticisms in verse on the management of the Dublin theatres. The book ran through five editions in one year. Equally successful was the Interjected Letter from Canton (1805), also anonymous, a satire on Dublin society. In 1807 he published a pamphlet on The State of Ireland, Past and Present, in which he advocated Catholic emancipation.

In the following year he entered parliament as member for Downpatrick, obtaining the seat on petition, though he had been unsuccessful at the poll. The acumen displayed in his Irish pamphlet led Spencer Perceval to recommend him in 1808 to Sir Arthur Wellesley, who had just been appointed to the command of the British forces in the Peninsula, as his deputy in the office of chief secretary for Ireland. This connexion led to a friendship which remained unbroken till Wellington’s death. The notorious case of the duke of York in connexion with his abuse of military patronage furnished him with an opportunity for distinguishing himself. The speech which he delivered on the 14th of March 1809, in answer to the charges of Colonel Wardle, was regarded as the most able and ingenious defence of the duke that was made in the debate; and Croker was appointed to the office of secretary to the Admiralty, which he held without interruption under various administrations for more than twenty years. He proved an excellent public servant, and made many improvements which have been of permanent value in the organization of his office. Among the first acts of his official career was the exposure of a fellow-official who had misappropriated the public funds to the extent of £200,000.

In 1827 he became the representative of the university of Dublin, having previously sat successively for the boroughs of Athlone, Yarmouth (Isle of Wight), Bodmin and Aldeburgh. He was a determined opponent of the Reform Bill, and vowed that he would never sit in a reformed parliament; his parliamentary career accordingly terminated in 1832. Two years earlier he had retired from his post at the admiralty on a pension of £5,000 a year. Many of his political speeches were published in pamphlet form, and they show him to have been a vigorous and effective, though somewhat unscrupulous and often virulently personal, party debater. Croker had been an ardent supporter of Peel, but finally broke with him when he began to advocate the repeal of the Corn Laws. He is said to have been the first to use (Jan. 1830) the term “conservatives.” He was for many years one of the leading contributors on literary and historical subjects to the Quarterly Review, with which he had been associated from its foundation. The rascorous spirit in which many of his articles were written did much to embitter party feeling. It also reacted unfavourably on Croker’s reputation as a worker in the department of pure literature by bringing political animosities into literary criticism. He had no sympathy with the younger school of poets who were in revolt against the Augustan style, and who in the 1810s introduced the new spurious Caryll for the famous Quarterly article on Keats. It is, nevertheless, unjust to judge Croker by the criticisms which Macaulay brought against his magnus opus, his edition of Boswell’s Life of Johnson (1831). With all its defects the work had merits which Macaulay was of course not concerned to point out, and Croker’s researches have been of the greatest value to subsequent editors. There is little doubt that Macaulay had personal reasons for his attack on Croker, who had more than once exposed in the House the fallacies that lay hidden under the orator’s brilliant rhetoric. Croker made no immediate reply to Macaulay’s attack, but when the first two volumes of the History appeared he took the opportunity of pointing out the inaccuracies that abounded in the work. Croker was occupied for several years on an annotated edition of Pope’s works. It was left unfinished at the time of his death, but it was afterwards completed by the Rev. Whitwell Elwin and Mr W. J. Courthope. He died at St Albans Bank, Hertford, on the 10th of August 1857.

Croker was generally supposed to be the original from which Disraeli drew the character of “Rigby” in Contingies, because he had for many years had the sole management of the estates of the marquess of Hertford, the “Lord Monmouth” of the story; but the comparison is a great injustice to the sterling worth of Croker’s character.

The chief works of Croker not already mentioned were his Studies for Children from the History of England (1817), which provided the model for Scott’s Tales of a Grandfather; Letters on the Naval War in America; A Reply to the Letters of Mailacht Malagrothyn (1815); Military Events of the French Revolution of 1830 (1831); a translation of Basompierre’s Embassy to England (1819); and several lyrical pieces of some merit, such as the Songs of Trafalgar (1806) and The Last Minions of France (1806). He also edited the Suffolk Papers (1823), Hervey’s Memoirs of the Court of George II. (1817), the Letters of Mary Lepel, Lady Hervey (1821–1822), and Walpole’s Letters to Lord Hervey (1824). His memoirs, diaries and correspondence were edited by John Jennings in two volumes, of which the first is entitled The Croker Papers (1857).

CROKER, RICHARD (1843– ), American politician, was born at Blackrock, Ireland, on the 24th of November 1843. He was taken to the United States by his parents when two years old, and was educated in the public schools of New York
CROKER, T. C.—CROMAGNON RACE

City, where he eventually became a member of Tammany Hall and active in its politics. He was an alderman from 1868 to 1870, a coroner from 1875 to 1876, a fire commissioner in 1883 and 1887, and city chamberlain from 1889 to 1890. After the fall of John Kelly he became the leader of Tammany Hall (q.v.), and for some time almost completely controlled the organization. His greatest political success was his bringing about the election of Robert A. van Wyck as first mayor of greater New York in 1897, and during van Wyck's administration Croker is popularly supposed to have dominated completely the government of the city. After Croker's failure to "carry" the city in the presidential election of 1900 and the defeat of his mayorality candidate, Edward M. Shepard, in 1901, he resigned from his position of leadership in Tammany, and retired to a country life in England and Ireland. In 1907 he won the Derby with his race-horse Orby.

CROKER, THOMAS CROFTON (1798-1854), Irish antiquary and humorist, was born in Cork on the 15th of January 1798. He was apprenticed to a merchant, but in 1819, through the interest of John Wilson Croker, who was, however, no relation of his, he became a clerk in the Admiralty. Moore was indebted to him in the production of his Irish Melodies for "many curious fragments of ancient poetry." In 1825 he produced his most popular book, the Fairy Legends and Traditions of the South of Ireland, which he followed up by the publication of his Legends of the Lakes (1829), his Adventures of Barney Mahoney (1832), and an edition of the Popular Songs of Ireland (1839). In 1827 he was made a member of the Irish Academy; in 1839 and 1840 he helped to found the Camden and Percy Societies, and in 1843 the British Archaeological Association. He wrote Narratives Illustrative of the Contests in Ireland in 1641 and 1688 (1841), for the Camden Society, Historical Songs of Ireland, &c. (1841), for the Percy Society, and several other works. He was also a member of the Hakluyt and the Antiquarian Society. He died in London on the 8th of August 1854.

CROLL, JAMES (1821-1890). Scottish man of science, was born of a peasant family at Little Whitleaf, in the parish of Cargill, in Perthshire, on the 2nd of January 1821. He was regarded as an unpromising boy, but a trifling circumstance aroused a passion for reading, and he made great progress in self-education. He was apprenticed to a wheelwright at Collace in Perthshire, but being debarred by ill-health from manual labour, he became successively a shop-keeper and an insurance agent. In 1853 he was made keeper of the Andersonian Museum in Glasgow, a humble appointment, which, however, gave him congenial occupation. In 1857, being deeply impressed by the metaphysics of Jonathan Edwards, he had published an anonymous volume entitled The Philosophy of Theism; but his connexion with the Museum induced him to take up physical science, and from 1861 onwards he studied with such perseverance that he was enabled to contribute papers to the Philosophical Magazine and other journals. For that magazine in 1864 he wrote his celebrated essay "On the Physical Cause of the Changes of Climate during Geological Epochs." This led to his appointment on the Scottish Geological Survey in 1867, and for thirteen years he took charge of the Edinburgh Office. In 1875 he summed up his researches upon the ancient condition of the earth in his Climate and Time, in their Geological Relations, in which he contends that terrestrial revolutions are due in a measure to cosmical causes. This theory excited warm controversy. Croall's replies to his opponents are collected in his Climate and Cosmology (1885). He had been compelled by ill-health to withdraw from the public service in 1880; yet, working under the greatest difficulties, and harassed by the inadequacy of his retiring pension, he managed to produce Stellar Evolution, discussing, among other things, the age of the sun, in 1889; and The Philosophical Basis of Evolution, partly a critique of Herbert Spencer's philosophy, in 1890. He died on the 13th of December 1890. The soundness of Croall's astronomical theory regarding the glacial period has since been criticized by E. P. Culverwell in the Geological Magazine for 1895, and by others; and it is now generally abandoned. Nevertheless it must be admitted that his work as a scientific worker under great discouragements was nothing less than heroic. The hon. degree of LL.D. was conferred on him in 1876 by the university of St Andrews; and he was elected F.R.S. in the same year.

CROLY, GEORGE (1780-1860), British divine and author, son of a Dublin physician, was born on the 17th of August 1780. He was educated at Trinity College, Dublin, and after ordination was appointed to a small curacy in the north of Ireland. About 1810 he came to London, and occupied himself with literary work. A man of restless energy, he claims attention by his extraordinary versatility. He wrote dramatic criticisms for a short-lived periodical called the New Times; he was one of the earliest contributors to Blackwood's Magazine; and to the Literary Gazette he contributed poems, reviews and essays on all kinds of subjects. In 1819 he married Margaret Helen Begbie. Efforts to secure an English living for Croly were frustrated, according to the Gentleman's Magazine (Jan. 1861), because Lord Eldon confounded him with a Roman Catholic of the same name. Excluding his contributions to the daily and weekly press his chief works were:—Paris in 1815 (1817), a poem in imitation of Childes Harold; Cathilne (1822), a tragedy lacking in dramatic force; Salathiel: A Story of the Past, the Present and the Future (1829), a successful romance of the "Wandering Jew" type; The Life and Times of his late Majesty George the Fourth (1830); Marston; or, The Soldier and Statesman (1846), a novel of modern life; The Modern Orland (1846), a satire which owes something to Don Juan; and some biographies, sermons and theological works.

Croly was an effective preacher, and continued to hope for preferment from the Tory leaders, to whom he had rendered considerable services by his pen; but he eventually received, in 1835, the living of St Stephen's, Waltham, London, from a Whig patron, Lord Brougham, with whose family he was connected. In 1847 he was made afternoon lecturer at the Foundling hospital, but this appointment proved unfortunate. He died suddenly on the 24th of November 1860, in London.

His Poetical Works (2 vols.) were collected in 1870. For a list of his works see Allibone's Critical Dictionary of English Literature (1859).

CROMAGNON RACE, the name given by Paul Broca to a type of mankind supposed to be represented by remains found by Lartet, Christy and others, in France in the Cromagnon cave at Les Eyzies, Tayac district, Dordogne. At the foot of a steep rock near the village this small cave, nearly filled with debris, was found by workmen in 1868. Towards the top of the loose strata three human skeletons were unearthed. They were those of an old man, a young man and a woman, the latter's skull bearing the mark of a severe wound. The skulls presented such special characteristics that Broca took them as types of a race. Palaeolithic man is exclusively long-headed, and the dolichocephalic appearance of the crania (they had a mean cephalic index 75-34) supported the view that the "find" at Les Eyzies was palaeolithic. It is, however, inaccurate to state that brachycephaly appears at once with the neolithic age, dolichocephaly even of a pronounced type persisting far into neolithic times. The Cromagnon race may thus be, as many anthropologists believe it, early neolithic, a type of man who spread over and inhabited a large portion of Europe at the close of the Pleistocene period. Some have sought to find in it the substratum of the present populations of western Europe. Quatrefages identifies Cromagnon man with the tall, long-headed, fair Kabyles (Berbers) who still survive in various parts of Mauritania. He suggests the introduction of the Cromagnon from Siberia, "arriving in Europe simultaneously with the great mammals (which were driven by the cold from Siberia), and no doubt following their route."
CROMARTY, GEORGE MACKENZIE, 1st Earl of (1630-1714), Scottish statesman, was the eldest son of Sir John Mackenzie, Bart., of Tarbat (d. 1654), and belonged to the same family as the earls of Seaforth. In 1654 he joined the rising in Scotland on behalf of Charles II. and after an exile of six years he returned to his own country and took some part in public affairs after the Restoration. In 1661 he became a lord of session as Lord Tarbat, but having been concerned in a vain attempt to overthrow Charles II.'s secretary, the earl of Lauderdale, he was dismissed from office in 1664. A period of retirement followed until 1678 when Mackenzie was appointed lord justice general of Scotland; in 1681 he became lord clerke register and a lord of session for the second time, and from 1682 to 1688 he was the chief minister of Charles II. and James II. In Scotland, being created viscount of Tarbat in 1685. In 1688, however, he deserted James and soon afterwards made his peace with William III., his experience being very serviceable to the new government in settling the affairs of Scotland. From 1692 to 1695 Tarbat was again lord clerke register, and having served for a short time as a secretary of state under Queen Anne he was created earl of Cromarty in 1703. He was again lord justice general from 1704 to 1710. He warmly supported the union between England and Scotland, writing a pamphlet in favour of this step, and he died the 17th of August 1714. Cromarty was a man of much learning, and among his numerous writings may be mentioned his Account of the conspiracies by the earls of Goswry and R. Logan (Edinburgh, 1713).

The earl's grandson George, 3rd earl of Cromarty (c. 1703-1760), succeeded his father John, the 2nd earl, in February 1731. In 1745 he joined Charles Edward, the young pretender, and he served with the Jacobites until April 1746 when he was taken prisoner in Sutherlandshire. He was tried and sentenced to death, but he obtained a conditional pardon although his peerage was forfeited. He died on the 28th of September 1766. This earl's eldest son was John Mackenzie, Lord Macleod (1727-1789), who shared his father's fortunes in 1745 and his fate in 1746. Having pleaded guilty at his trial Macleod was pardoned on condition that he gave up all his rights in the estates of the earldom, and he left England and entered the Swedish army. In this service he rose to high rank and was made Count Cromarty. The count returned to England in 1777 and was successful in raising, mainly among the Jacobites of the surrounding districts, a company of Highland Light Infantry, which was the first of which, now the Highland Light Infantry, served under him in India. In 1784 he regained the family estates and he died on the 2nd of April 1789. Macleod wrote an account of the Jacobite rising of 1745, and also one of a campaign in Bohemia in which he took part in 1757; both are printed in Sir W. Fraser's Earls of Cromartie (Edinburgh, 1786).

Macleod left no children, and his heir was his cousin, Kenneth Mackenzie (d. 1796), a grandson of the 2nd earl, who also died childless. The estates then passed to Macleod's sister, Isabel (1725-1801), wife of George Murray, 6th Lord Elmbank. In 1806 Isabel's descendant, Anne (1829-1888), wife of George, 3rd duke of Sutherland, was created countess of Cromartie with remainder to her second son Francis (1832-1893), who became earl of Cromartie in 1888. In 1895, two years after the death of Francis, his daughter Sibell Lilian (b. 1878) was granted by letters patent the title of countess of Cromartie.

CROMARTY, a police burgh and seaport of the county of Ross and Cromarty, Scotland. Pop. (1901) 2142. It is situated on the southern shore of the mouth of Cromarty Firth, 5 m. E. by E. of the Black Isle. The line of the railway, which skirts the shore, has a daily communication by steamer, and 0 m. N.E. of Fortrose, the most convenient railway station. Before the union of the shires of Ross and Cromarty, it was the county town of Cromartyshire, and is one of the Wick district group of parliamentary burghs. Its name is variously derived from the Gaelic crom, crooked, and bath, bay, or ard, height, meaning either the "crooked bay," or the "bend between the heights" (the high rocks, or Sutors, which guard the entrance to the Firth), and gave the title to the earldom of Cromarty. The principal buildings are the town hall and the Hugh Miller Institute. The harbour, enclosed by two piers, accommodates the herring fleet, but the fisheries, the staple industry, have declined. The town, however, is growing repute as a midsummer resort. The thatched house with crow-stepped gables in Church Street, in which Hugh Miller the geologist was born, still stands, and a statue has been erected to his memory. To the east of the burgh is Cromarty House, occupying the site of the old castle of the earls of Ross. It was the birthplace of Sir Thomas Urquhart, the translator of Rabelais.

Cromarty, formerly a county in the north of Scotland, was incorporated with Ross-shire in 1889 under the designation of the county of Ross and Cromarty. The nucleus of the county consisted of the lands of Cromarty in the north of the peninsula of the Black Isle. To this were added from time to time the various estates scattered throughout Ross-shire—the most considerable of which were the districts around Ullapool and Little Loch Broom on the Atlantic coast, the area in which Ben Wyvis is situated, and a tract to the north of Loch Fannich—which had been acquired by the ancestors of Sir George Mackenzie (1630-1714), afterwards Viscount Tarbat (1658) and 1st earl of Cromarty (1703). Desirous of combining these sporadic properties into one shire, Viscount Tarbat was able to procure their annexation to the county of Ross and Cromarty. Sir George Mackenzie of Cromartie in 1685 and 1686, the area of the enlarged county amounting to nearly 370 sq. m. (See Ross and Cromarty.)

CROMARTY Firth, an arm of the North Sea, belonging to the county of Ross and Cromarty, Scotland. From the Moray Firth it extends inland in a westerly and then south-westerly direction for a distance of 19 m. Excepting at the Bay of Nigg, on the northern shore, and Cromarty Bay, on the southern, where it is about 5 m. wide (due N. and S.), and at Alness Bay, where it is 2 m. wide, it has an average width of 1 m. and a depth varying from 5 to 10 fathoms, forming one of the safest and most commodious anchorages in the north of Scotland. Besides other streams it receives the Conon, Peffery, Sklick and Alness, and the principal places on its shores are Dingwall near the head, Cromarty near the mouth, Kiltearn, Invergordon and Kilmuir on the north. The entrance is guarded by two precipitous rocks—the one on the north 400 ft., that on the south 465 ft. high—called the Sutors from a fancied resemblance to a couple of shoe-makers (Scotice, souter), bending over their lasts. There are ferries at Kinlochbervie and Invergordon to Dingwall.

CROME, JOHN (1769-1821), Irish landscape painter, founder and chief representative of the "Norwich School," often called Old Crome, to distinguish him from his son, was born at Norwich, on the 21st of December 1769. His father was a weaver, and could give him only the scantiest education. His early years were spent in work of the humblest kind; and at a fit age he became apprentice to a house-painter. To this step he appears to have been led by an inborn love of art and the desire to acquaint himself by any means with its materials and processes. During his apprenticeship he sometimes painted signboards, and devoted what leisure time he had to sketching from nature. Through the influence of a rich art-loving friend he was enabled to exchange his occupation of house-painter for that of drawing-master; and in this he was engaged throughout his life. He took great delight in a collection of Dutch pictures to which he had access, and these he carefully studied. About 1790 he was introduced to Sir William Beechey, whose house in London he frequently visited, and from whom he gathered additional knowledge and help in his art. In 1805 the Norwich Society of Artists took definite shape, its origin being traceable about a year or two further back. Crome was an original and the largest contributor to its annual exhibitions. Among his pupils were James Stark, Vincent, Thistle and John Bernay (Barney) Crome (1794-1842), his son, J. S. Cotman, too, a greater artist than any of these, was associated with him. Crome continued to reside at Norwich, and with the exception of his short visits to London had little or no communication with the great artists of his own time. He first exhibited at the Royal Academy in 1806; but in this and the following twelve years he exhibited there only fourteen of his works. With very
few exceptions Crome's subjects are taken from the familiar scenery of his native county. Fidelity to nature was his dominant aim. “The sky, the hill, the boat, and the slow water of the flatland, trees most of all—the single tree in elaborate study, the group of trees, and how the growth of one affects that of another, and the characteristics of each,”—these, says Frederick Wedmore (Studies in English Art), are the things to which he is most constant. He still remains, says the same critic, of many trees the greatest draughtsman, and is especially the master of the oak. His most important works are—“Mousehold Heath, near Norwich,” now in the National Gallery; “Clump of Trees, Hautbois Common”; “Oak at Poringland”; the “Willow”; “Coast Scene near Yarmouth”; “Bruges, on the Ostend River”; “Slate Quarries”; “the Italian Boulevards”; and the “Fishmarket at Boulogne.”

He executed a good many etchings, and the great charm of these is in the beautiful and faithful representation of trees. Crome enjoyed a very limited reputation during his life, and his pictures were sold at low prices; but since his death they have been more and more appreciated, and have given him a high place among English painters of landscape. He died at Norwich on the 22nd of April 1821. His son, J. B. Crome, was his assistant in teaching, and his pictures were in the same style, his moonlight effects being much admired.

A collection of “Old” Crome’s etchings, entitled Norfolk Picturesque Scenery, was published in 1834, and was re-issued with a memoir by Dawson Turner in 1838, but in this issue the prints were retouched by other hands.

CROMER, EVELYN BARING, 1ST EARL (1841— ). British statesman and diplomatist, was born on the 24th of February 1841, the ninth, but eldest, son of Henry John, 1st Viscount Northbrook, in 26th March 1859 by Cecilia Amabel, only daughter of Admiral Windham of Felbrigg Hall, Norfolk. Having joined the Royal Artillery in 1858, he was appointed in 1861 A.D.C. to Sir Henry Storks, high commissioner of the Ionian Islands, and acted as secretary to the same chief during the inquiry into the Jamaica outbreak in 1865. Gazetted captain in 1870, he went in 1872 as private secretary to his cousin Lord Northbrook, Viceroy of India, where he remained until 1876, when he became major, received the C.S.I., and was appointed British commissioner of the Egyptian public debt office. Up to this period Major Baring had given no unusual signs of promise, and the appointment of a comparatively untried major of artillery as the British representative on a financial board composed of representatives of all the great powers was considered a bold one. Within a very short time it was recognized that the Englishman, though keeping himself carefully in the background, was unmistakably the predominant factor on the board. He was mainly responsible for the searching report, issued in 1876, of the commission of inquiry which had been instituted into the financial methods of the Khedive Ismail; and when that able and unscrupulous Oriental hero, doubtfully to submit to an enforced abdication in 1879, it was Major Baring who became the British controller-general and practical director of the Dual Control. Had he remained in Egypt, the whole course of Egyptian history might have been altered, but his services were deemed more necessary in India, and under Lord Ripon he became financial member of council in June 1880. He remained there till 1883, leaving an unmistakable mark on the Indian financial system, and then, having been rewarded by the C.S.I., he was appointed British agent and consul-general in Egypt and a minister plenipotentiary in the diplomatic service.

Sir Evelyn Baring was at that time only a man of forty-two, who had gained a reputation for considerable financial ability, combined with an abruptness of manner and a certain autocracy of demeanour which, it was feared, would impede his success in a position which required considerable tact and diplomacy. It was a friendly colleague who wrote—

"The virtues of patience are known. But I think that, when put to the touch, the people of Egypt will own, with a groan, there’s an Evil in Baring too much."

When he arrived in Cairo in 1883 he found the administration of the country almost non-existent. Ismail had ruled with all the vices, but also with all the advantages, of autocracy. Disorder in the finances, brutality towards the people, had been combined with public tranquillity and the outer semblance of civilization. Order, at least, reigned from the Sudan to the Mediterranean, and such trivial military disturbances as had occurred had been of Ismail’s own devising and for his own purposes. Tewfiq, who had succeeded him, had neither the inclination nor character to be a despot. Within three years his government had been all but overthrown, and he was only held by the grace of British bayonets. Government by bayonets was not in accord with the views of the House of Commons, yet Ismail’s government by the koubash could not be restored. The British government, under Mr Gladstone, desired to establish in Egypt a sort of constitutional government; and as there existed no single element of a constitution, they had sent out Lord Dufferin (the first marquess of Dufferin) to frame one. That gifted nobleman, in the delightful lucidity of his picturesque report, left nothing to be desired except the material necessary to convert the flowing words into political entities. In the absence of that, the constitution was still-born, and Sir Evelyn Baring arrived to find, not indeed a clean slate, but a worn-out papyrus, disfigured by the efforts of centuries to depict in it a form of government for a docile people.

From that date the history of Sir Evelyn Baring was that of the Egyptian prime minister Sir Evelyn Baring in 1892, G.C.B. in 1895, viscount in 1897, and earl in 1901, is the history of Egypt, and requires the barest mention of its salient points here. From the outset he realized that the task he had to perform could only be effected piecemeal and in detail, and his very first measure was one which, though severely criticized at the time, has been justified by events, and which in any case showed that he shirked no responsibility, and was capable of adopting heroic methods. He counselled the abandonment, at least temporarily, by Egypt of its authority in the Sudan provinces, already challenged by the mahdi. His views were shared by the British ministry of the day and the policy of abandonment enforced upon the Egyptian government. At the same time it was decided that efforts should be made to relieve the Egyptian garrisons in the Sudan and this resolve led to the mission of General C. G. Gordon (q.e.) to Khartum. Lord Cromer subsequently told the story of Gordon’s mission at length, making clear the measure of responsibility resting upon him as British agent. The proposal to employ Gordon came from the British government. Sir Evelyn rejected the suggestion. Finally, mistrusting his own judgment, he did not consider Gordon the proper person for the mission. Baring yielded to pressure from Lord Granville. Thereafter he gave Gordon all the support possible, and in the critical matter of the proposed despatch of Zobeir to Khartum, Baring—after a few days’ hesitation—cordially endorsed Gordon’s request.

The request was refused by the British government—and the catastrophe which followed at Khartum rendered inevitable.

The Sudan crisis being over, for the time, Sir Evelyn Baring set to work to reorganize Egypt itself. This work he attacked in detail. The very first essential was to regulate the financial situation; and in Egypt, where the entire revenue is based on the production of the soil, irrigation was of the first importance. With the assistance of Sir Colin Scott Moncrieff, in the public works department, and Sir Edgar Vincent, as financial adviser, these two great departments were practically put in order before he gave more than superficial attention to the rest. The Ministry of Justice was the next department seriously taken in hand, with the assistance of Sir John Dobbin, while the army had been reformed under Sir Evelyn Wood, who was succeeded by Sir Francis (afterwards Lord) Grenfell. Education, the ministry
of the interior, and gradually every other department, came to be reorganized, or, more correctly speaking, formed, under Lord Cromer's carefully persistent direction, until it may be said to-day that his administration has safely challenged comparison with that of any other state. In the meantime the time of the mahdi and his successor, the khilifa, in the temporarily abandoned provinces of the Sudan, had been weakened by internal dissensions; the Italians from Massawa, the Belgians from the Congo State, and the French from their West African possessions, had gradually approached nearer to the valley of the Nile; and the moment had arrived at which Egypt must decide either to recover her position in the Sudan or allow the Upper Nile to fall into hands hostile to Great Britain and her position in Egypt. Lord Cromer was as quick to recognize the moment for action and to act as he had fifteen years earlier been prompt to recognize the necessity of abstention. In September—October 1896 the first advance was made to Dongola under the Sirdar, Sir Herbert (afterwards Lord) Kitchener; between July 1897 and April 1898 the advance was pushed forward to the Atbara; and on the 2nd of September 1898, the battle of Omdurman finally crushed the power of the khilifa and restored the position to the Sudan of Egypt. In the negotiations which resulted in the Anglo-French Declaration of the 8th of April 1904, whereby France bound herself not to obstruct in any manner the action of Great Britain in Egypt and the Egyptian government acquired financial freedom, Lord Cromer took an active part. He also successfully guarded the interests of Egypt and Great Britain in 1906 when Turkey attempted by encroachments in the Sinaí Peninsula to obtain a strategic position on the Suez Canal. To have effected all this in the face of the greatest difficulties—political, national and international—and at the same time to have raised the credit of the country from a condition of bankruptcy to an equality with that of the first European powers, entitles Lord Cromer to a very high place among the greatest administrators and statesmen that the British empire has produced. In April 1907, in consequence of the state of his health, he resigned office, having held the post of British agent in Egypt for twenty-four years. In July of the same year parliament granted £50,000 out of the public funds to Lord Cromer in recognition of his eminent service to Egypt. In 1908 he published, in two volumes, Modern Egypt, in which he gave an impartial narrative of events in Egypt and the Sudan since 1876, and dealt with the results to Egypt of the British occupation of the country. Lord Cromer also took part in the political controversies at home, joining himself to the free-trade wing of the Unionist party.

Lord Cromer married in 1876 Ethel Stanley, daughter of Sir Rowland Stanley Errington, eleventh baronet, but was left a widower with two sons in 1898; and in 1901 he married Lady Katherine Thynne, daughter of the 4th marquess of Bath.

**CROMER**, a watering-place in the northern parliamentary division of Norfolk, England, 139 m. N.E. by N. from London by the Great Eastern railway; served also by the Midland and Great Northern joint line. Pop. of urban district (1901) 3781. Standing on cliffs of considerable elevation, the town has repeatedly suffered from ravages of the sea. A wall and esplanade extend along the bottom of the cliffs, and there is a fine stretch of sandy beach. The church of St Peter and St Paul is Perpendicular (largely restored) with a lofty tower. On a site of three acres stands the convalescent home of the Norfolk and Norwich hospital. There is an excellent golf course. The heronry, cod, lobster and crab fisheries are prosecuted. The village of Sheringham (pop. of urban district, 2359), lying to the west, is also frequented by visitors. A so-called Roman camp, on an elevation overlooking the sea, is actually a modern beacon.

**CROMORNE**, also **CRUMHORNE**¹ (Ger. Krumhorn; Fr. tournebouts), a wind instrument of wood in which a cylindrical column of air is set in vibration by a reed. The lower extremity is turned up in a half-circle, and from this peculiarity it has gained the French name tournebouts. The reed of the cromorne, like that of the bassoon, is formed by a double tongue of cane adapted to the small end of a conical brass tube or crook, the large end fitting into the main bore of the instrument. It presents, however, this difference, that it is not, like that of the bassoon, in contact with the player's lips, but is covered by a cap pierced in the upper part with a raised slit against which the performer's lips rest, the air being forced through the opening into the cap and setting the reed in vibration. The reed itself is therefore not subject to the pressure of the lips. The compass of the instrument is in consequence limited to the simple fundamental sounds produced by the successive opening of the lateral holes. The length of the cromorones is inconsiderable in proportion to the deep sounds produced by them, which arises from the fact that these instruments, like all tubes of cylindrical bore provided with reeds, have the acoustic properties of the stopped pipes of an organ. That is to say, theoretically they require only half the length necessary for the open pipe, and the organ for such pipes provided with reeds, to produce notes of the same pitch. Moreover, when, to obtain an harmonic, the column of air is divided, the cromorne will not give the octave, like the oboe and bassoon, but the twelfth, corresponding in this peculiarity with the clarinet and all stopped pipes or bourdons. In order, however, to obtain an harmonic on the cromone, the cap would have to be discarded, for a reed only overblows to give the harmonic overtones when pressed by the lips. With the ordinary boring of eight lateral holes the cromorne possesses a limited compass of a ninth. Sometimes, however, deeper sounds are obtained by the addition of one or more keys.

By its construction the cromone is one of the oldest wind instruments; it is evidently derived from the Gr. aulos⁴ and the Roman tibia, which likewise consisted of a simple cylindrical pipe of which the air column was set in vibration, at first by a double reed; we have reason to believe, later by a single reed (see Aulos and Clarinet).

The Phrygian aulos was sometimes curved (see Tib. ii. 1. 85 Phrygico tibia curva sono; Vigil. Aen. xi. 737 curva choros indixit tibia Bacchi).³

Notwithstanding the successive improvements that were introduced in the manufacture of wind instruments, the cromorne scarcely ever varied in the details of its construction. Such as we see it represented in the treatise by Virdung⁴ we find it again about the epoch of its disappearance.⁵ The cromorones existed as a complete family from the 15th century, consisting, according to Virdung, of four instruments; Praetorius⁶ cites five—the deep bass, the tenor or alto, the canus or soprano and the high soprano, with compass as shown. A hand, or, to use the expression of Praetorius,

![Bass Tournebouts](image_url)

an "accord" of cromorones comprised 1 deep bass, 2 bass, 3 tenor, 2 canus, 1 high soprano = 9.

Mersenne⁷ explains the construction of the cromone, giving careful illustrations of the instrument with and without the cap. From him we learn that these instruments were made in England, where they were played in concert in sets of four, five and six. Their scheme of construction and especially the reed and cap is very similar to that of the chalumeau of the musette (see BAG-PIPE), but its timbre is by
CROMPTON—CROMWELL, HENRY

no means so pleasant. Mersenne's crummones have ten fingerholes, Nos. 7 and 8 being duplicates for right and left-handed players. They were probably sometimes used, as was the case with the hautbois de Poitou (see BAG-PIPE), without the cap, when an extended column was required.

The crummones were in very general use in Europe from the 14th to the 17th century, and are to be found in illustrations of pageants, as for instance in the magnificent collection of woodcuts designed by Hans Burgmair, a pupil of Albrecht Dürer, representing the triumph of Maximilian at Ingolstadt (1516), where the crummoner was a player figure in the procession among countless other musicians. In the inventory of the wardrobe, &c., belonging to Henry VIII. at Westminster, made during the reign of Edward VI., we find eighteen crumlongs, the term used in England, and one crumterne, a term which appears to have been used in respect of the tromba-marina, the first crumterne player being John Thew, who was one of the pensioners of the Chapel Royal at Strassburg comprised two tournebouts or crummones, and until the middle of the 18th century these instruments formed part of the court band known as 'Musique de la Grande Ecurie' in the service of the Kings of France and French kings. They are first mentioned in the accounts for the year 1662, together with the tromba-marina, although the instrument was already highly esteemed in the 16th century. In that year players of the crummones were enrolled among the musicians of the 'Musique de la Grande Ecurie' (see infra); they receive an annual salary of 120 livres, which various supplementary allowances brought up to about 330 livres. In 1729 one of the crummones players sold his appointment for 4000 francs. This was a sign of the failing popularity of the instrument, for at this time the duties of the crummones and tromba-marina players consisted in playing in the great divertissements and at court functions and festivities in honour of royal marriages, births and thanksgivings.

Crummones have become of extreme rarity and are not to be found in all collections. The Paris Conservatoire possesses one large bass crummon of the 16th century, the Kgl. Hochschule für Musik, Berlin, a set of seven, and the Ambraser Sammlung, Vienna, a crummon in Eb. The museum of the Conservatoire Royal de Musique, Paris, possesses the good fortune Sarrasse to possess a rare crummon, the key belonging to a large crummon bearing the date 1537, of which he gives a drawing. A crummon appears in a musical scene with a trumpet in Hermann Finck's Pratica Musica.4 The Platerupul, of which Virdung gives a drawing, is only a kind of crummon. It is characterized by having, instead of a cap to cover the reed, a spherical receiver surrounding the reed, to which the tube for inspiration is adapted. The Platerupul is also frequently classified among bagpipes. In the Codex de Santa Maria, a MS. of the 13th century preserved in the Escolar, Madrid, two instruments of this type are represented. One of these has two straight, parallel pipes, slightly conical; the other is frankly conical with wide bore turned up at the end.

Other instruments belonging by their most important characteristics of cylindrical bore and double reed to the same family as the crummon, although the bore was somewhat differently disposed, are the racket bassoon and the sordium or sordelline. The latter was introduced into England by Jacob. Reproductions of the sordelline are found in 'Flauti overo due tibia all' antica che noi chiamiamo sordelline,' a description which tallies with what has been said above concerning the aulos and tibia. (V. M. and K. S.)

CROMPTON, SAMUEL (1755-1827), English inventor, was born on the 3rd December 1753 at Firwood near Bolton-le-Moors, Lancashire. While yet a boy he lost his father, and had to support himself by various employments, and by spinning yarn. The defects of the spinning Jenny imbued him with the idea of devising something better, and for five or six years the effort absorbed all his spare time and money, including what he earned by playing the violin at the Bolton theatre. About 1779 he succeeded in producing a machine which span yarn suitable for use in the manufacture of muslin, and which was known as the muslin wheel or the Hall-in-the-Wood wheel (from the name of the house in which he and his family resided), and later as the spinning mule. After his marriage in 1780 a good demand arose for the yarn which he himself made at Hall-in-the-Wood, but the preying to which his methods were subjected drove him, in the absence of means to take out a patent, to the choice of destroying his machine or making it public. He adopted the latter alternative on the promise of a number of manufacturers to pay him for the use of the mule, but all he received was about £60. He then resumed spinning on his own account, but with indifferent success. In 1800 a sum of £500 was raised for his benefit by subscription, and when in 1809 Edmund Cartwright, then in the power of the machine he obtained £10,000 from parliament, he determined also to apply for a grant. In 1811 he made a tour in the manufacturing districts of Lancashire and Scotland to collect evidence showing how extensively his mule was used, and in 1812 parliament allowed him £8000. With the aid of this money he embarked in business, first as a bleacher and then as a cotton merchant and spinner, but again without success. In 1824 some friends, without his knowledge, bought him an annuity of £65. He died at Bolton on the 26th of June 1827.

CROMPTON, an urban district of Lancashire, England, 23 m. N. of Oldham, within the parliamentary borough of Oldham. Pop. (1901) 13,427. At Shaw, a populous village included within it, is a station on the Lancashire & Yorkshire railway. Cotton mills and the collieries of the neighbourhood employ the large industrial population.

CROMWELL, HENRY (1628-1674), fourth son of Oliver Cromwell, was born at Huntingdon on the 20th of January 1628, and served under his father during the latter part of the Civil War. In 1651, after the death of his father, he was made a corporal, and served in the New Army, and in the same year was made a private in the regiment of the Earl of Manchester. In 1654 he was again in Ireland, and after making certain recommendations to his father, now lord protector, with regard to the government of that country, he became major-general of the forces in Ireland and a member of the Irish council of state, taking up his new duties in July 1655. Nominally Henry was subordinate to the lord-deputy, Charles Fleetwood, but Fleetwood's departure for England in September 1655 left him for all practical purposes the ruler of Ireland. He moderated the lord-deputy's policy of deporting the Irish, and, unlike him he paid some attention to the interests of the English settlers; moreover, again unlike Fleetwood, he appears to have held the scales evenly between the different Protestant sects, and his undoubted popularity in Ireland is attested by Clarendon. In November 1657 Henry himself was made lord-deputy; but before this time he had refused a gift of property worth £1500 a year, basing his refusal on the grounds of the poverty of the Irish and the fact that the property which was not the least of his troubles. In 1657 he advised his father not to accept the office of king, although in 1654 he had supported a motion to this effect.

and after the dissolution of Cromwell's second parliament in February 1658 he showed his anxiety that the protector should act in a moderate and constitutional manner. At Oliver's departure he was stripped of his office as lord high turbary and the successions of his brother Richard to the office of protector, but although he was now appointed lieutenant and governor general of Ireland, it was only with great reluctance that he remained in that country.

Having rejected proposals to assist in the restoration of Charles II., Henry was recalled to England in June 1659 just after his brother's fall; quietly obeying this order he resigned his office at once. Although he lost some property at the Restoration, he was allowed to make a settlement to keep the estate he had bought in Ireland. His concluding years were passed at Spinney Abbey in Cambridgeshire; he was unmolested by the government, and he died on the 23rd of March 1674. In 1653 Henry married Elizabeth (d. 1687), daughter of Sir Francis Russell, and he left five sons and two daughters.

**CROMWELL, OLIVER** (1599-1658), lord protector of England, was the 9th and only surviving son of Robert Cromwell of Huntingdon and of Elizabeth Steward, widow of William Lynn. His paternal grandfather was Sir Henry Cromwell of Hinchbrook, a leading personage in Huntingdonshire, and grandson of Richard Williams, knighted by Henry VIII., nephew of Thomas Cromwell, earl of Essex, Henry VIII.'s minister, whose name he adopted. His mother was descended from a family named Steward in Norfolk, which was not only connected in any way, but was descended of the same stock, with the royal house of Stuart. Oliver was born on the 21st of April 1600, was educated under Dr Thomas Beard, a fervent puritan, at the free school at Huntingdon, and on the 23rd of April 1616 matriculated as a fellow-commoner at Sidney Sussex College, Cambridge, then a hotbed of puritanism, subsequently studying law in London. The royalist anecdotes relating to his youth, including charges of ill-conduct, do not deserve credit, the entries in the register of St John's, Huntingdon, noting Oliver's admission on two occasions to church censure being forgeries; but it is not improbable that his youth was wild and possibly dissolute. According to Edmund Waller he was "very well read in the Greek and Roman story." Burnet declares he had little Latin, but he was able to converse with the Dutch ambassador in that language. According to James Heath in his *Flagellum*, "he was more famous for his exercises in the fields than in the schools, being one of the chief match-makers and players at football, cudgels, or any other boisterous game or sport." On the 22nd of August 1620 he married Elizabeth, daughter of Sir James Bourchier, a city merchant of Tower Hill, and of Felstead in Essex; and his father having died in 1621 he settled at Huntingdon, and some few years afterwards took up the management of his small estate. In 1628 he was returned to parliament as member for the borough, and on the 11th of February 1629 he spoke in support of puritan doctrine, complaining of the attempt by the king to silence Dr Beard, who had raised his voice against the "flat popery" incited by Dr Alabaster at Paul's Cross. He was also one of the members who refused to adjourn at the king's command till Sir John Eliot's resolutions had been passed.

During the eleven years of government without parliament very little is recorded of Cromwell. His name is not connected with the resistance of the levy of ship-money or to the action of the ecclesiastical courts, but in 1630 he was one of those fined for refusing to take up knighthood. The same year he was named one of the justices of the peace for his borough; and on the grant of a new charter showed great zeal in defending the rights of the commoners, and succeeded in procuring an alteration in the charter in their favour, exhibiting much warmth of temper during the dispute and being committed to custody by the privy council for angry words spoken against the mayor, for which he afterwards apologized. He also defended the rights of the commoners of Ely threatened by the adventurers "who had drained the Great Level, and he was nicknamed afterwards by a royalist newspaper "Lord of the Fens." He was again later the champion of the commoners of St Ives in the Long Parliament against enclosures by the earl of Manchester, obtaining a commission of the House of Commons to inquire into the case, and draughting on himself the genus of the charter of the future Lord Clarendon. by his "improper carriage" and "insolent behaviour," and by the passionate vehemence he imparted into the business. Bishop Williams, a kinsman of Cromwell's, relates at this time that he was "a common spokesman for sectaries, and maintained their part with great stubbornness"; and his earliest extant letter (in 1635) is an appeal for subscriptions for a puritan lecturer. There appears to be no foundation for the statement that he was stopped by an order of council when on the point of abandoning England for America, though there can be little doubt that the thoughts of emigration suggested themselves to his mind at this period. He viewed the "innovations in religion" with abhorrence. According to Clarendon he told the latter in 1641 that if the Grand Remonstrance had not passed "he would have sold all he had the next morning and never have seen England more." In 1631 he converted his landed property into money, and John Hampden, his cousin, a patenteen of Connecticut in 1632, was on the point of emigrating. Cromwell was perhaps arrested in his project by his succession in 1636 to the estate of his uncle Sir Thomas Steward, and to his office of farmer of the cathedral tithes at Ely, whither he now removed. Meanwhile, like Bunyan and many other puritans, Cromwell had been passing through a trying period of mental and religious change and struggle, beginning with deep melancholy and religious doubt and depression, and ending with "seeing light" and with enthusiastic and convinced faith, which remained henceforth the chief characteristic and impulse in his career.

He represented Cambridge in the Short and Long Parliaments of 1640, and at once showed extraordinary zeal and audacity in his opposition to the government, taking a large share in business and serving on numerous and important committees. As the cousin of Hampden and St. John he was intimately associated with the leaders of the parliamentary party. His sphere of action, however, was not in parliament. He was not an orator, and though he could express himself forcibly on occasion, his speech was incoherent and devoid of any of the arts of rhetoric. Clarendon notes on his first appearance in parliament that "he seemed to have a person in no degree gracious, no ornament of discourse, none of those talents which use to reconcile the affections of the standers by; yet as he grew into place and authority his parts seemed to be renewed." He supported stoutly the extreme party of opposition to the king, but did not take a seat in the committees of the House of Commons except on important occasions, and was apparently silent in the debates on the Petition of Right, the Grand Remonstrance and the Militia. His first recorded intervention in debate in the Long Parliament was on the 9th of November 1640, a few days after the meeting of the House, when he delivered a petition from the imprisoned John Lilburne. He was described by Sir Philip Warwick on this occasion:—"I came into the House one morning well clad and perceived a gentleman speaking whom I knew not, very ordinarily apparelled; for it was a plain cloth suit which seemed to have been made by an ill country tailor; his linen was plain and not very clean;... his stature was of a good size; his sword stuck close to his side; his countenance swollen and reddish; his voice sharp and unutterable and his eloquence full of fervour... I sincerely profess it much lessened my reverence as to that great council for he was very much heartened unto." On the 30th of December he moved to the second reading of Strode's bill for annual parliaments. His chief interest from the first, however, lay in the religious question. He belonged to the Root and Branch party, and spoke in favour of the petition of the London citizens for the abolition of episcopacy on the 5th of February 1641, and pressed upon the House the Root and Branch Bill in May. On the 6th of November he carried a motion entrusting the train-bands south of the Trent to the command of the earl of Essex. On the 14th of January 1642, after the king's attempt to seize the five members, he moved for a committee to put the kingdom in a
CROMWELL, OLIVER

posture of defence. He contributed £600 to the proposed Irish campaign and £1,000 for raising forces in England—large sums from his small estate—and on his own initiative in July 1642 sent arms of the value of £100 down to Cambridge, seized the magazine there in August, and prevented the king's commission of array from being executed in the county, taking these important steps on his own authority and receiving subsequently indemnity by vote of the House of Commons. Shortly afterwards he joined Essex with sixty horse, and was present at Edgehill, where his troops were one of the few not routed by Rupert's charge, Cromwell himself being mentioned among those officers who "never stirred from their troops but fought till the last minute."

During the earlier part of the year 1643 the military position of Charles was greatly superior to that of the parliament. Essex was inactive near Oxford; in the west Sir Ralph Hopton had won a series of victories, and in the north Newcastle defeated the Fairfax forces at Adwalton Moor, and all Yorkshire except Hull was in his hands. It seemed likely that the whole of the north would be laid open and the royalists be able to march upon London and join Charles and Hopton there. This stroke, which would most probably have given the victory to the king, was prevented by the "Eastern Association," a union of Norfolk, Suffolk, Essex, Cambridgeshire and Hertford, and constituted a master of arms and rhapsody in 1643 by Huntingdonshire and Lincolnshire, of which Cromwell was the leading spirit. His zeal and energy met everywhere with conspicuous success. In January 1643 he seized the royalist high sheriff of Hertford in the act of proclaiming the king's commission of array at Alans; in February he was at Cambridge taking measures for the defence of the town; in March suppressing royalist risings at Lowestoft and Lynn; in April those of Huntington, when he also recaptured Crowland from the king's party. In May he defeated a greatly superior royalist force at Grantham, proceeding afterwards to Nottingham in accordance with Essex's plan of penetrating into Yorkshire to relieve the Fairfax; where, however, difficulties, arising from jealousies between officers, and the treachery of John Hotham, whose arrest Cromwell was instrumental in effecting, obliged him to retire again to the association, leaving the Fairfax to be defeated at Adwalton Moor. He showed extraordinary energy, resource and military talent in stemming the advance of the royalists, who now followed up their victories by advancing into the association; he defeated them at Gainsborough on the 26th of fourth, and met again on the 11th of February, in which he was defeated. He augmented the forces of Lincoln, while the victory on the 11th of October at Winceby finally secured the association, and maintained the wedge which prevented the junction of the royalists in the north with the king in the south.

One great source of Cromwell's strength was the military reforms he had initiated. At Edgehill he had observed the inferiority of the parliamentary to the royalist horse, composed as it was of soldiers of fortune and the dregs of the populace. "Do you think," he had said, "that the spirits of such base, mean fellows will ever be able to encounter gentlemen that have honour and courage and resolution in them? You must get men of a spirit that is likely to go as far as gentlemen will go or you will be beaten still."

The royalists were fighting for a great cause. To succeed the parliamentary soldiers must also be inspired by some great principle, and this was now found in religion. Cromwell chose his own troops, both officers and privates, from the "religious men," whom fought not for pay or for adventure, but for their faith. He declared, when answering a complaint that a certain captain in his regiment was a better preacher than fighter, that he who praved best would fight best, and that he knew which could "give the like courage and confidence as the knowledge of God in Christ will." The superiority of these men—more intelligent than the common soldiers, better disciplined, better trained, better armed, excellent horsemen and fighting for a great cause—not only over the other parliamentary troops but over the royalists, was soon observed in battle. According to Clarendon the latter, though frequently victorious in a charge, could not rally afterwards, whereas Cromwell's troops if they prevailed, or though they were beaten and routed, presently rallied again and stood in good order till they received new orders; and the king's military successes dwindled in proportion to the gradual preponderance of Cromwell's troops in the parliamentary army. At first these picked men only existed in Cromwell's own troop, which, however, by frequent additions became the nucleus of a regiment, and by the time of the New Model included about 11,000 men.

In July 1643 Cromwell had been appointed governor of the Isle of Ely; on the 22nd of January 1644 he became second in command under the earl of Manchester as lieutenant-general of the Eastern Association, and on the 10th of February 1644 a member of the Committee of Both Kingdoms with greatly increased influence. In March he took Hillesden House in Buckinghamshire; in May was at the siege of Lincoln, when he repulsed Goring's attempt to relieve the town, and subsequently took part in Manchester's campaign in the north. At Marston Moor (q.v.) on the 2nd of July he commanded all the host of the Eastern Association, with some Scottish troops; and though for a time disabled by a wound in the neck, he charged and routed Rupert's troops opposed to him, and subsequently went to the support of the Scots, who were hard pressed by the enemy, and converted what appeared at one time to be an impenetrable force into a decisive victory. It was on this occasion that he earned the nickname of "Ironsides," applied to him now by Prince Rupert, and afterwards to his soldiers, "from the impenetrable strength of his troops which could by no means be broken or divided."

The movements of Manchester after Marston Moor were marked by great apathy. He was one of the moderate party who desired an accommodation with the king, and was opposed to Cromwell's scartories. He remained at Lincoln, did nothing to prevent the defeat of Essex's army in the west, and when he at last advanced south to join Essex's and Waller's troops his management of the army led to the failure of the attack upon the king at Newbury on the 27th of October 1644. He delayed supporting the infantry till too late, and was repulsed; he allowed the royal army to march past his outposts; and a fortnight afterwards, without any attempt to prevent it, and greatly to Cromwell's vexation, permitted the moving of the king's artillery and the relief of Donnington Castle by Prince Rupert. "If you beat the king ninety-nine times," Manchester urged at Newbury, "yet he is king still and so will his posterity be, and the king bent the one we shall all be hanged and our posterity be made slaves."

"My lord," answered Cromwell, "if this be so, why did we take up arms at first? This is against fighting ever hereafter. If so let us make peace, be it ever so base." The contention brought to a crisis the struggle between the moderate Presbyterians and the Scots on the one side, who decided to maintain the monarchy and fought for an accommodation and to establish Presbyterianism in England, and on the other the republicans who would be satisfied with nothing less than the complete overthrow of the king, and the Independents who regarded the establishment of Presbyterianism as an evil almost as great as that of the Church of England. On the 23rd of November Cromwell charged Manchester with "unwillingness to have the war prosecuted to a full victory"; which Manchester answered by accusing Cromwell of having used expressions against the nobility, the Scots and Presbyterianism; of desiring to fill the army of the Eastern Association with Independents to prevent any accommodation; and of having vowed if he met the king in battle he would as lief fire his pistol at him as at anybody else. The lords and the Scots vehemently took Manchester's part; but the Commons eventually sided with Cromwell, appointed Sir Thomas Fairfax general of the New Model Army, and passed two self-denying ordinances, the second of which, ordering all members of both houses to lay down their commissions within forty days, was accepted by the lords on the 3rd of April 1645.

Meanwhile Cromwell had been ordered on the 3rd of March by the House to take his regiment to the assistance of Waller, under whom he served as an admirable subordinate. "Although
he was blunt," says Waller, "he did not bear himself with pride or disdain. As an officer he was obedient and did never dispute my orders or argue upon them." He returned on the 19th of April, and on the 23rd was sent to Oxfordshire to prevent a junction between Charles and Prince Rupert, in which he succeeded after some small engagements and the storming of Blechington House. His services were felt to be too valuable to be lost, and on the 10th of May his command was prolonged for forty days. On the 28th he was sent to Ely for the defence of the eastern counties against the king's advance; and on the 18th of June, upon Fairfax's petition, he was named by the Commons lieutenant-general, joining Fairfax on the 13th with six hundred horse. At the decisive battle of Naseby (the 14th of June 1645) he commanded the parliamentary right wing and routed the cavalry of Sir Marmaduke Langdale, subsequently falling upon and defeating the royalist centre, and pursuing the fugitives as far as the outskirts of Leicester. At Langport again, on the 10th of July 1645, his management of the troops was largely instrumental in gaining the victory. As the king had no longer a field army, the war after Naseby resolved itself into a series of sieges while Charles had no means of raising. Cromwell was present at the sieges of Bridgewater, Bath, Sherborne and Bristol; and later, in command of four regiments of foot and three of horse, he was employed in clearing Wiltshire and Hampshire of the royalist garrisons. He took Devizes and Lacock House, Winchester and Basing House, and rejoined Fairfax in October at Exeter, and accompanied him to Cornwall, where he assisted in the defeat of Hopton's forces and in the suppression of the royalists in the west. On the 9th of January 1646 he surprised Lord Wentworth's brigade at Bovey Tracey, and was present with Fairfax at the fall of Exeter on the 9th of April. He then went to London to give an account of proceedings to the parliament, was thanked for his services and rewarded with the estate of the marquess of Worcester. He was present again with Fairfax at the capitulation of Oxford on the 24th of June, which practically terminated the Civil War, when he used his influence in favour of granting lenient terms. He then removed with his family from Ely to Drury Lane, London, and about a year later to King Street, Westminster.

The next year, the great question of the establishment of Presbyterianism or Independency had to be decided. Cromwell, without naming himself an adherent of any denomination, fought vigorously for Independency as a policy. In 1644 he had remonstrated at the removal by Crawford of an anabaptist lieutenant-colonel. "The state," he said, "in choosing men to serve it, takes no notice of their opinions. If they be willing faithfully to serve it, that satisfies. Take heed of being sharp... against those to whom you can object little but that they square not with you in every opinion concerning matters of religion." He had patronized Lilburne and welcomed all into his regiment, and the Independents had spread from his troops throughout the whole army. But while the sectaries were in a vast majority in the army, the parliament was equally strong in Presbyterianism and opposed to toleration. The proposed disbandment of the army in February 1647 would have placed the soldiers entirely in the power of the parliament; while the negotiations of the king, first with the Scots and then with the parliament, appeared to hazard all the fruits of the petition from the army to the parliament for arrears of pay was suppressed and the petitioners declared enemies of the state. In consequence the army organized a systematic opposition, and elected representatives styled Agitators or Agents to urge their claims. Cromwell, though greatly disliking the policy of the Presbyterians, yet gave little support at first to the army in resisting parliament. In May 1647 in company with Skippon, Ireton and Fleetwood, he visited the army, inquired into and reported on the grievances, and endeavoured to persuade them to submit to the parliament. "If that authority falls to nothing," he said, "nothing can follow but confusion." The Presbyterians, however, now engaged in a plan for restoring the king under their own control, and by the means of a Scottish army, forced on their policy, and on the 27th of May ordered the immediate disbandment of the army, without any guarantee for the payment of arrears. A mutiny was the consequence. The soldiers refused to disband, and on the 3rd of June Cromwell, whom, it was believed, the parliament intended to arrest, joined the army. "If he would not forthcoming come and lead them," they had told him, "they would go their own way without him." The supremacy of the army without a guiding hand meant anarchy, that of the Presbyterians the outbreak of another civil war.

Possession of the king's person now became an important consideration. On the 31st of May 1647 Cromwell had ordered Cornet Joyce to prevent the king's removal by the parliament or the Scots from Holmby, and Joyce by his own authority and with the king's consent brought him to Newmarket to the headquarters of the army. Cromwell soon restored order, and the representative council, including privates as well as officers chosen to negotiate with the parliament, was subordinate to the council of war. The army with Cromwell then advanced to London and was there addressed by Cromwell himself, the officers repudiated any wish to alter the civil government or upset the establishment of Presbyterianism, but demanded religious toleration. Subsequently, in the declaration of the 14th of June, arbitrary power either in the parliament or in the king was denounced, and demand was made for a representative parliament, the speedy termination of the actual assembly, and the recognition of the right to petition. Cromwell used his influence in restraining the more eager who wished to march on London immediately, and in avoiding the use of force by which nothing permanent could be effected, urging that "whatever we get by treaty will be firm and durable. It will be conveyed over to posterity." The army faction gradually gathered strength in the parliament. Eleven Presbyterian leaders impeached by the army withdrew of their own accord on the 28th of June, and the parliament finally yielded. Fairfax was appointed sole commander-in-chief on the 18th of July, the soldiers levied to oppose the army were dismissed, and the command of the city militia was again restored to the committee approved by the army. These votes, however, were cancelled later, on the 26th of July, under the pressure of the royalist city mob which invaded the two Houses; but the two speakers, with eight peers and fifty-seven members of the Commons, themselves joined the army, which now advanced to London, overawing all resistance, escorting the fugitive members in triumph to Westminster on the 6th of August, and obliging the parliament on the 20th to cancel the last votes, with the threat of a regiment of cavalry drawn up by Cromwell in Hyde Park.

Cromwell and the army now turned with hopes of a settlement to Charles. On the 4th of July Cromwell had had an interview with the king at Caversham. He was not insensible to Charles's good qualities, was touched by the paternal affection he showed for his children, and is said to have declared that Charles "was the uprightest and most conscientious man of his three kingdoms." The Heads of the Proposals, which, on Charles raising objections, had been modified by the influence of Cromwell and Ireton, demanded the control of the militia and the choice of ministers for the soldiers, a religious toleration, and virtual, if not of state to which much of the royal control over the army and foreign policy would be delegated. These proposals without doubt largely diminished the royal power, and were rejected by Charles with the hope of maintaining his sovereign rights by "playing a game," to use his own words, i.e. by negotiating simultaneously with army and parliament, by inflaming their jealousies and differences, and finally by these means securing his restoration with his full prerogatives unimpaired. On the 9th of September Charles refused once more the Newcastle Propositions offered him by the parliament, and Cromwell, together with Ireton and Vane, obtained the passing of a motion for a new application; but the terms asked by the parliament were higher than before and included a harsh condition—the
CROMWELL, OLIVER

exclusion from pardon of all the king's leading adherents, besides the indefinite establishment of Presbyterianism and the refusal of toleration to the Roman Catholics and members of the Church of England.

Meanwhile the failure to come to terms with Charles and pressure for a settlement appeared to threaten a general anarchy. Cromwell's moderate counsels created distrust in his good faith amongst the soldiers, who accused him of "prostituting the liberties and persons of all the people at the foot of the king's interest." The agitators demanded immediate settlement by force of arms. The extreme republicans, anticipating Rousseau, put forward the Agreement of the People. This was strongly opposed by Cromwell, who declared the very consideration of it had dangers, that it would bring upon the country "utter confusion" and "make England like Switzerland." Universal suffrage he rejected as tending "very much to anarchy," spoke against the hasty abolition of either the monarchy or the Lords, and refused entirely to consider the abstract principles brought into the debate. Political problems were not to be so resolved, but practically. With Cromwell as with Burke the question was "whether the spirit of the people of this nation is prepared to go along with it." The special form of government was not the important point, but its possibility and its acceptability. The great problem was to found a stable government, an authority to keep order. If every man should fight for the best form of government the state would come to desolation. He reproached the soldiers for their insubordination against their officers, and the army for its rebellion against the parliament. He would lay hold of anything "if it had but the force of authority," rather than have none. Cromwell's influence prevailed and these extreme proposals were laid aside.

Meanwhile all hopes of an accommodation with Charles were dispelled by his flight on the 11th of November from Hampton Court to Carisbrooke Castle in the Isle of Wight, his object being to negotiate independently with the Scots, the parliament and the army. His action, however, in the event, diminished rather than increased his chances of success, owing to the distrust of his intentions which it inspired. Both the army and the parliament gave cold replies to his offers to negotiate; and Charles, on the 27th of December 1647, entered into the Engagement with the Scots by which he promised the establishment of Presbyterianism for three years, the suppression of the Independents and their sects, together with privileges for the Scottish nobles, while the Scots undertook to invade England for the restoration of his royal power. This alliance, though on exact terms were not known to Cromwell — the king's wish was to vassalize us to a foreign nation, "to use his own words—convinced him of the uselessness of any plan for maintaining Charles on the throne; though he still appears to have clung to monarchy, proposing in January 1648 the transference of the crown to the prince of Wales. A week after the signing of the treaty he supported a proposal for the king's deposition, and the vote of No Addresses was carried. Meanwhile the position of Charles's opponents had been considerably strengthened by the suppression of a dangerous rebellion in November 1647 by Cromwell's intervention, and by the return of troops to obedience. Cromwell's difficulties, however, were immense. His moderate and trimming attitude was understood neither by the extreme Independents nor by the Presbyterians. He made one attempt to reconcile the disputes between the army and the politicians by a conference, but ended the barren discussion on the relative merits of aristocracies, monaracies and democracies, interspersed with Bible texts, by throwing a cushion at the speaker's head and running downstairs. On the 19th of January 1648 Cromwell was accused of high treason by Lilburne. Plots were formed for his assassination. He was overtaken by a dangerous illness, and on the 2nd of March civil war in support of the king broke out.

Cromwell left London in May to suppress the royalists in Wales, and took Pembroke Castle on the 11th of July. Meanwhile behind his back the royalists had risen all over England, the fleet in the Downs had declared for Charles, and the Scottish army under Hamilton had invaded the north. Immediately on the fall of Pembroke Cromwell set out to relieve Lambert, who was slowly retreating before Hamilton's superior forces; he joined him near Knaresborough on the 12th of August, and started next day in pursuit of Hamilton in Lancashire, placing himself at Stonyhurst near Preston, cutting off Hamilton from the north and his allies, and defeating him in detail on the 17th, 18th and 19th at Preston and at Warrington. He then marched north into Scotland, following the forces of Monro, and established a new government of the Argyle faction at Edinburgh; replying to the Independents who disapproved of his mild treatment of the Presbyterians, that he desired "union and right understanding between the godly people, Scots, English, Jews, Gentiles, Presbyterians, Anabaptists and all; ... a more glorious work in our eyes than if we had gotten the sack and plunder of Edinburgh ... and made a conquest from the Tweed to the Orcades."

The incident of the Second Civil War and the treaty with the Scots exasperated Cromwell against the king. On his return to London he found the parliament again negotiating with Charles, and on the eve of making a treaty which Charles himself had no intention of keeping and regarded merely as a means of regaining his power, which would have thrown a blush upon one moment on which all the advantages gained during years of bloodshed and struggle. Cromwell therefore did not hesitate to join the army in its opposition to the parliament, and supported the Remonstrance of the troops (29th of November 1648), which included the demand for the king's punishment as "the grand author of all our troubles," and justified the use of force by the army if other means failed. The parliament, however, continued to negotiate, and accordingly Charles was removed by the army to Hurst Castle on the 1st of December, the troops occupied London on the 2nd; while on the 6th and 7th Colonel Pride "purged" the House of Commons of the Presbyterians. Cromwell was not the originator of this act, but showed his approval of it by taking his seat among the fifty or sixty Independent members who remained.

The disposal of the king was now the great question to be decided. During the next few weeks Cromwell appears to have made once more attempts to come to terms with Charles; but the king was inflexible in his refusal to part with the essential powers of the monarchy, or with the Church; and at the end of January 1649, it was resolved to bring him to trial. The exact shape in which Cromwell had in this decision and its sequel is obscure, and the later accounts of the regicides when on their trial at the Restoration, ascribing the whole transaction to his initiation and agency, cannot be altogether accepted. But it is plain that, once convinced of the necessity for the king's execution, he was the chief instrument in overcoming all scruples among his judges, and in resisting the protests and appeals of the Scots. To Algernon Sidney, who refused to take part in proceedings on the plea that neither the king nor any man could be tried by such a court, Cromwell replied, "I tell you, we will cut off his head with the crown upon it."

The execution of the king took place on the 30th of January 1649. This event, the turning-point in Cromwell's career, casts a shadow, from one point of view, over the whole of his future statesmanship. He himself never repented of the act, regarding it, on the contrary, as "one which Christians in after times will mention with honour and all tyrants in the world look at with fear," and as one directly ordained by God. Opinions, no doubt, will always differ as to the wisdom or authority of the policy which brought Charles to the scaffold. On the one hand, there was no law except that by which an offence could be attributed to the sovereign, the anointed king, the justice. The ordinance establishing the special tribunal for the trial was passed by a remnant of the House of Commons alone, from which all dissentients were excluded by the army. The tribunal was composed, not of judges—for all unanimously refused to sit on it—but of
CROMWELL, OLIVER

five-two men drawn from among the king's enemies. The execution was a military and not a national act, and at the last stroke of the scaffold the triumphant shouts of the soldiery could not overwhelm the groans and sob's raised by the populace. Whatever crimes might be charged against Charles, his past conduct might appear to be condoned by the act of negotiating with him. On the other hand, the execution seemed to Cromwell the only alternative to anarchy, or to a return to despotism and the abandonment of all they had fought for. Cromwell had exhausted every expedient for arriving at an arrangement with the king by which the royal authority might be preserved, and the repeated perjury and inexhaustible shiftings of Charles had proved the hopelessness of such attempts. The results produced by the king's execution were far-reaching and permanent. It is true that Puritan austerity and the lack of any strong central authority after Oliver's death produced a reaction which temporarily restored Charles's dynasty to the throne; but it is not less true that the execution of the king, at a later time when all over Europe absolute monarchies "by divine right" were being established on the ruins of the ancient popular constitutions, was an object lesson to all the world; and it produced a profound effect, not only in establishing constitutional monarchy in Great Britain after James II., with the dread of his father's fate before him, had abdicated by flight, but in giving the impulse to that revolt against the idea of "the divinity that doth hedge a king" which culminated in the Revolution of 1789, and of which the mighty effects are still evident in Europe and beyond.

Cromwell in Ireland.

Cromwell had next to turn his attention to the suppression of royalism in Ireland and in Scotland. In Ireland Ormonde had succeeded in uniting the English and the Irish in a league against the supporters of the parliament, and only a few scattered forts held out for the Commonwealth, while the young king was every day expected to land and complete the conquest of the island. Accordingly in March 1649 Cromwell was appointed lord-lieutenant and commander-in-chief for its reduction. But before starting he was called upon to suppress disorder at home. The Levellers, with some severity and showed his instinctive dislike to revolutionary proposals. "Did not that levelling principle," he said, "tend to the reducing of all to an equality? What was the purport of it but to make the tenant as liberal a fortune as the landlord, which I think if obtained would not have lasted long." Equally characteristic was his treatment of the mutinous army, in which he suppressed a rebellion in May. He landed at Dublin on the 13th of August. Before his arrival the Dublin garrison had defeated Ormonde with a loss of 5000 men, and Cromwell's work was limited to the capture of detached fortresses. On the 10th of September he stormed Drogheda, and by his order the whole of its 2800 defenders were put to the sword without quarter. Cromwell, who was as a rule especially scrupulous in protecting non-combatants from violence, justified his severity in this case by the cruelties perpetrated by the Irish in the rebellion of 1641, and as being necessary on military and political grounds that it would tend to prevent the effusion of blood for which were the satisfactory grounds of such actions, which otherwise cannot but work remorse and regret." After the fall of Drogheda Cromwell sent a few troops to relieve Londonderry, and marched himself to Wexford, which he took on the 11th of October, and where similar scenes of cruelty were repeated; every captured priest, to use Cromwell's own words, being immediately "knocked on the head," though the story of the three hundred women slaughtered in the market-place has no foundation.

The surrender of Trim, Dundalk and Rosser followed, but at Waterford Cromwell met with a stubborn resistance and the advent of winter obliged him to raise the siege. Next year Cromwell penetrated into Munster. Cashel, Cahir and several castles fell in February, and Kilkenny in March; Cromwell repulsing the assault with great loss, but surrendering on the 10th of May 1650. Cromwell himself sailed a fortnight later, leaving the reduction of the island, which was completed in 1652, to his generals. The re-settlement of the conquered and devastated country was now organized on the Tudor and Straffordian basis of colonization from England, conversion to Protestantism, and establishment of law and order. Cromwell thoroughly approved of the enormous scheme of confiscation and colonization, causing great privations and sufferings, which was carried out. The Roman Catholic landowners lost their estates, all or part according to their degree of guilt, and these were distributed among Cromwell's soldiers and the creditors of the government; Cromwell also invited new settlers from home and from New England, two-thirds of the whole land of Ireland being thus transferred to new proprietors. The suppression of Roman Catholicism was zealously pursued by Cromwell; the priests were hunted down and imprisoned or exiled to Spain or Barbados, the mass was everywhere forbidden, and the only liberty allowed was that of conscience, the Romanist not being obliged to attend Protestant services.

These methods, together with education, "assiduous preaching...humanity, good life, equal and honest dealing with men of different opinions," Cromwell thought, "would convert the whole island to Protestantism. The law was ably and justly administered, and Irish trade was admitted to the same privileges as English, enjoying the same rights in foreign and colonial trade; and no attempt was made to subordinate the interests of the former to the latter, which was the policy adopted both before and after Cromwell's time, while the union of Irish and English interests was further recognized by the Irish representation at Westminster in the parliaments of 1654, 1656 and 1659. These advantages, however, scarcely benefited all the Irish Roman Catholics, who were excluded from political life and from the corporate towns; and Cromwell's union meant little more than the union of the English colony in Ireland with England. A just administration, too, did not compensate for unjust laws or produce contentment; the policy of conversion and colonization was unsuccessful, the descendants of many of Cromwell's soldiers becoming merged in the Roman Catholic Irish, and the union with England, political and commercial, being extinguished at the Restoration of the Stuart's. Cromwell's land settlement—modified by the restoration under Charles II. of about one-third of the estates to the royalists—survived, and added to the difficulties with which the English government was afterwards confronted in Ireland.

Meanwhile Cromwell had hurried home to deal with the royalists in Scotland. He urged Fairfax to attack the Scots at once in their own country and to forestall their invasion; but Fairfax refused and resigned, and Cromwell was appointed by parliament, on the 26th of June 1650, commander-in-chief of all the forces of the Commonwealth. He entered Scotland in July, and after a campaign in the neighbourhood of Edinburgh which proved unsuccessful in drawing out the Scots from their fortresses, he retreated to Dunbar to await reinforcements from Berwick. The Scots under Leslie followed him, occupied Doon Hill commanding the town, and seized the passes between Dunbar and Berwick which Cromwell had omitted to secure. Cromwell was now manoeuvred into a position where he could be cut off from England and from his supplies except from the sea. But Leslie descended the hill to complete his triumph, and Cromwell immediately observed the disadvantages of his antagonist's new position, cramp'd by the hill behind and separated from his left wing. A stubborn struggle on the next day, the 3rd of September, gave Cromwell a decisive victory. Advancing, he occupied Edinburgh and Leith. At first it seemed likely that his victories and subsequent remonstrances would effect a peace with the Scots; but by 1651 Charles II. had succeeded in forming a new union of royalists and presbyterians, and another campaign became inevitable. Some delay was caused in beginning operations by Cromwell's dangerous illness, during which his life was despaired of; but in June he was confronting Leslie entrenched in the hills near Stirling, impregnable to attack and refusing an engagement. Cromwell determined to turn his antagonist's
CROMWELL, OLIVER

position. He sent 14,000 men into Fifeshire and marched to Perth, which he captured on the 2nd of August, thus cutting off Leslie from the north and his supplies. This movement, however, left open the way to England, and Charles immediately marched south, in reality thus giving Cromwell the wished-for opportunity of crushing the royalists finally and decisively. Cromwell followed through Yorkshire, and uniting with Lambert and Harrison at Evesham proceeded to attack the royalists at Worcester; where on the 3rd of September after a fierce struggle the great victory, "the crowning mercy" which terminated the Civil War, was obtained over Charles.

Monk completed the subjugation of Scotland by 1654. The settlement here was made on more moderate lines than in Ireland. The estates of only twenty-four leaders of the defeated cause were forfeited by Cromwell, and the national church was left untouched though deprived of all powers of interference with the civil government, the general assembly being dissolved in 1653. Large steps were made towards the union of the two kingdoms by the representation of Scotland in the parliament at Westminster; free trade between the two countries was established, the administration of justice greatly improved, vassalage and heritable jurisdictions abolished, and security and good order maintained by the council of nine appointed by the Protector. In 1658 the improved condition of Scotland was the subject of Cromwell's special congratulations in addressing parliament, but as in Ireland so Cromwell's policy in Scotland was unpopular and was only upheld by the maintenance of a large army, necessitating heavy taxation and implying the loss of the national independence. It also vanished at the Restoration.

On the 12th of September 1651 Cromwell made his triumphal entry into London at the conclusion of his victorious campaigns; and parliament granted him Hampton Court as a residence with £4000 a year. These triumphs, however, had all been obtained by force of arms; the more difficult task now awaited Cromwell of governing England by parliament and by law. As Milton wrote:

"Cromwell; our chief of men, who through a cloud
Not of war only, but distractions rude,
Guided by faith and matchless fortitude,
To peace and truth thy glorious way hast ploughed,
... Peace hath her victories
No less renowned than war."

Cromwell's moderation and freedom from imperiousness were acknowledged even by those least friendly to his principles. Although the idol of his victorious army, and in a position enabling him to exercise autocratic power, he laboured unconsciously for more than a year and a half as a member of the parliament, whose authority he supported to the best of his ability. While occupied with work on committees and in administration he pressed forward several schemes of reform, including a large measure of law reform prepared by a commission presided over by Matthew Hale, and the settlement of the church; but very little was accomplished by the parliament, which seemed to be almost exclusively taken up with the maintenance and increase of its own powers; and Cromwell's dissatisfaction, and that of the army which increased every day, was intensified by the knowledge that the parliament, instead of dissolving for a new election, was seeking to perpetuate its tenure of power. At length, in April 1653, "a bill for a new representation" was discussed, which provided for the retention of their seats by the existing members without re-election, so that they would also be the sole judges of the eligibility of the rest. This measure, which placed the whole powers of the state—executive, legislative, military and judicial—in the hands of one irresponsible and permanent chamber, "the horridest arbitrariness that ever was exercised in the world," Cromwell and the army determined to resist at all costs. On the 15th of April they proposed that the parliament should appoint a provisional government and dissolve itself. This compromise was refused by the parliament, which proceeded on the 20th to press through its last stages the "bill for a new representation." Cromwell hastened to the House, and at the last moment, on the bill being put to the vote, whispering to Harrison, "This is the time; I must do it," he rose and, after alluding to the former good services of the parliament, proceeded to overwhelm the members with reproaches. Striding up and down the House in a passion, he made no attempt to control himself, and turning towards individuals as he hurled significant epithets at each, he called some "whoremasters," others "drunkards, corrupt, unjust, scandalous to the profession of the Gospel." "Perhaps you think," he exclaimed, "that this is not parliamentary language; I confess it is not, neither are you to expect any such from me." In reply to a complaint of his violence he cried, "Come, come, I will put an end to your sitting." By his directions Harrison then fetched in a small band of Cromwell's musketeers and compelled the speaker Lenthall to vacate the chair. Looking at the mace he said, "What shall we do with this bauble?" and ordered a soldier to take it away. The members then trooped out, Cromwell crying after them, "It is you that have forced me to this; for I have sought the Lord night and day, that He would slay me than put me upon the doing this work." He then snatched the instrumentous bill from the clerk, put it under his cloak, and commanding the doors to be locked went back to Whitehall. In the afternoon he dissolved the council in spite of John Bradshaw's remonstrances, who said, "Sir, we have heard what you did at the House this morning... but you are mistaken to think that the parliament is dissolved, for no power under heaven can dissolve them but themselves; therefore take you notice of that." Cromwell had no patience with formal pedantry of this sort; and in point of strict legality "The Rump" of the Long Parliament had little better title to authority than the officers who expelled it from the House. After this Cromwell had nothing left but the army with which to govern, and "henceforth his life was a vain attempt to clothe that force in constitutional forms, and make it seem something else so that it might become something else." By the dissolution of the Long Parliament Cromwell as commander-in-chief was left the sole authority in the state. He determined immediately to summon another parliament. This was the "Little" or "Barbonian Parliament," consisting of one hundred and forty persons selected by the council of officers from among those nominated by the congregations in each county, which met on the 4th of July 1653. This assembly, however, soon showed itself impracticable and incapable, and on the 12th of December the speaker, followed by the more moderate members, marched to Whitehall and returned their powers to Cromwell, while the rest were expelled by the army.

Cromwell, who had no desire to exercise arbitrary power and whose main object therefore was to devise some constitutional limit to the authority which circumstances had placed in his hands, now accepted the written constitution drawn up by some of the officers, called the Instrument of Government, the earliest example of a "fixed government" based on "fundamentals" or constitutional guarantees, and the only example of it in English history. Its author had wished Oliver to assume the title of king, but this he repeatedly refused; and in the instrument he was named Protector, a parliament was established, limited in powers but whose measures were not restricted by the Protector's veto unless they contravened the constitution, the Protector's executive power being also limited by the council. The Protector and the council together were given a life tenure of office, with a large army and a settled revenue sufficient for public needs in time of peace; while the clauses relating to religion "are remarkable as laying down for the first time with authority a principle of toleration," though this toleration did not apply to Roman Catholics and Anglicans. On the 16th of December 1653 Cromwell was installed in his new office, dressed as a civilian in a plain black coat instead of in scarlet as a general, in order

1 C. H. Firth, Cromwell, p. 324.
2 John Morley, Oliver Cromwell, p. 393.
to demonstrate that military government had given place to civil; for he approached his task in the same spirit that had prompted his declaration to the Little Parliament of his wish "to divest the sword of all power in the Civil administration."

In the interval between his nomination as Protector and the summoning of his first parliament in September 1654, Cromwell was empowered together with his council to legislate by ordinances; and eighty-two were issued in all, dealing with numerous and various reforms and including the reorganization of the treasury, the settlement of Ireland and Scotland and the union of the three kingdoms, the relief of poor prisoners, and the maintenance of the highways. These ordinances in many instances showed the hand of the true statesman. Cromwell was essentially a conservative reformer; in his attempts to purge the court of chancy of its most flagrant abuses, and to settle the ecclesiastical affairs of the nation, he showed himself anxious to retain as much of the existing system as could be left untouched without doing positive evil. He was out-voted by his council on the question of commutation of tithes, and his enlightened zeal for reforming the "wicked and abominable" sentences of the criminal law met with complete failure. Many of these ordinances were subsequently confirmed by parliament, and, "on the whole, this body of dictatorial legislation, abnormal in form as it is, in substance was a wise and moderate set of reforms."

His ordinances for the "Reformation of Manners," the product of the puritan spirit, had been a transitory expedient. The Long Parliament had ordered a strict observance of Sunday, punished swearing severely, and made adultery a capital crime; Cromwell issued further ordinances against duelling, swearing, race-meetings and cock-fights—the last as tending to the disturbance of the public peace and the encouragement of "disolute practices to the dishonour of God." Cromwell himself was no ascetic and saw no harm in honest sport. He was exceedingly fond of horses and hunting, leaping ditches prudently avoided by the foreign ambassadors. Baxter describes him as full of animal spirits, "naturally of such a vivacity, hilarity and alacrity as another man is when he hath drunken a cup of wine too much," and notes his "familiar rustic carriage with his soldiers in sporting." He was fond of music and of art, and kept stations in Hampton Court Gardens which scandalized good puritans. He preferred that Englishmen should be free rather than sober by compulsion. Writing to the Scottish clergy, and rejecting their claim to suppress dissent in order to extirpate error, he said, "Your pretended fear lest error should step in is like the man who would keep all wine out of the country lest men should be drunk. It will be found an unjust and unwise jealousy to deprive a man of his natural liberty upon a supposition he may abuse it. When he doth abuse it, judge.

It is probable that very little of this moral legislation was enforced in practice, though special efforts were made under the government of the major-generals. Cromwell expected more results from the effects of education and culture. A part of the revenue of confiscated church lands was allotted to the maintenance of schools, and the question of national education was seriously taken in hand by the Commonwealth. Cromwell was especially interested in the universities. In 1649 he had been elected D.C.L. at Oxford, and in 1651 chancellor of the University, an office which he held till 1657, when he was succeeded by his son Richard. He founded a new readership in Divinity, and presented Greek MSS. to the Bodleian. He appointed visitors for the universities and great public schools, and defended the universities from the attacks of the extreme sectaries who clamoured for their abolition, even Clarendon allowing that Oxford "yielded a harvest of extraordinary good and sound knowledge in all parts of learning." In 1657 he founded a new university at Durham, which was suppressed at the Restoration. He patronized learning. Milton and Marvell were his secretaries. He allowed the royalists Hobbes and Cowley to return to England, and lived in friendship with the poet Waller.

Cromwell's religious policy included the maintenance of a national church, a policy acceptable to the army but much disliked by the Scots, who wanted the church to conform to the state, not the state the church. He improved the incomes of poor livings by revenues derived from episcopal estates and the fines of delinquents. An important feature of his church government was the appointment on the 20th of March 1654 of the "Triers," thirty-eight clerical and lay commissioners, who decided upon the qualifications of candidates for livings, and without whose recommendation none could be appointed; while an ordinance of August 1654 provided for the removal of the unfit, the latter class including besides immoral persons those holding "popish" or blasphemous opinions, those publicly using the English Prayer Book, and the disaffected to the government. Religious toleration was granted, but with the important exception that some harsh measures were enacted against Anglicans and Roman Catholics, to neither of whom was liberty of worship accorded. The acts imposing fines for recusancy, repealed in 1650, were later executed with great severity. In 1655 a proclamation was issued for administering the laws against the priests and Jesuits, and some executions were carried out. Complete toleration in fact was only extended to Protestant nonconformists, who composed the Cromwellian established church, and who now met out to their antagonists the same treatment which themselves were later to receive under the Clarendon Code of 1660.

Cromwell himself, however, remained throughout a staunch and constant upholder of religious toleration. "I had rather that Mahommedanism were permitted amongst us," he avowed, "than that one of God's children should be persecuted." Far in advance of his contemporaries on this question, whenever his personal action is disclosed it is invariably on the side of forbearance and modification. It is probable, from the absence of evidence to the contrary, that much of this severe legislation was never executed, and it was without doubt Cromwell's restraining hand which moderated the narrow persecuting spirit of the executive. In practice Anglican private worship appears to have been little interfered with; and although the recusant fines were rigorously exacted, the same seems to have been the case with the private celebration of the mass. Bordeaux, the French envoy in England, wrote that, in spite of the severe laws, the Romanists received better treatment under the Protectorate than under any other government. Cromwell's strong personal inclination towards toleration is clearly seen in his treatment of the Jews and Quakers. He was unable, owing to the opposition of the divines and of the merchants, to secure the full recognition of the right to reside in England of the former who had for some time lived in small numbers and traded unnoticed and untroubled in the country; but he obtained an opinion from two judges that there was no law which forbade their return, and he gave them a private assurance of his protection, with leave to celebrate their private worship and to possess a cemetery.

Cromwell's policy in this instance was not overturned at the Restoration, and the great Jewish immigration into England with all its important consequences may be held to date practically from these first concessions made by Cromwell. His personal intervention also alleviated the condition of the Quakers, much persecuted at this time. In an interview in 1654 the sincerity and enthusiasm of George Fox had greatly moved Cromwell and had convinced him of their freedom from dangerous political schemes. He ordered Fox's liberation, and in November 1657 issued a general order directing that Quakers should be treated with leniency, and be discharged from confinement. Doctrines directly attacking Christianity Cromwell regarded, indeed, as outside toleration and to be punished by the civil power, but at the same time he mitigated the severity of the penalty ordained by the law. In general the toleration enjoyed under Cromwell was probably far greater than at any period since religion became the contending ground of political parties, and certainly greater than under his immediate successors.

1 Frederic Harrison, Oliver Cromwell, p. 214.
Lilburne and the anabaptists, and John Rogers and the Fifth Monarchy men, were prosecuted only on account of their direct attacks upon the government, and Cromwell in his broad-minded and tolerant statesmanship was himself in advance of his age and his administration. He believed in the spiritual and unseen rather than in the outward and visible unity of Christendom.

In foreign policy Cromwell's chief aims appear to have been to support and extend the Protestant faith, to promote English trade, and to prevent a Stuart restoration by foreign aid—the religious mission of England in the world, her commercial interests, and her political independence being indissolubly connected in his mind. The beginning of his rule inherited a war with France and Holland; the former consequent on Cromwell's failure to obtain terms for the Huguenots or the cession of Dunkirk, and the latter—for which he was not responsible—the result of commercial rivalry, of disputes concerning the rights of neutrals, of bitter memories of Dutch misdeeds in the East Indies, and of dynastic causes arising from the stadholder, William II. of Orange, having married Mary, daughter of Charles I. In 1651 the Dutch completed a treaty with Denmark to injure English trade in the Baltic; to which England replied the same year by the Navigation Act, which checked the growth of the English colonies in the Dutch fish trade with England, and struck at the Dutch carrying trade. War was declared in May 1652 after a fight between Blake and Tromp off Dover, and was continued with signal victories and defeats on both sides till 1654. The religious element, however, which predominated in Cromwell's foreign policy inclined him to peace, and in April of that year terms were arranged by which England on the whole was decidedly the gainer. The Dutch acknowledged the supremacy of the English flag in the British seas, which Tromp had before refused; they accepted the Navigation Act, and undertook privately to exclude the princes of Orange from the command of their forces. The Protestant policy was further followed up by treaties with Sweden and Denmark which secured the passage of the Sound for English ships on the same conditions as the Dutch, and a treaty with Portugal which liberalised English subjects from the Inquisition and allowed commerce with the Portuguese colonies. The two great Roman Catholic powers now both bid for Cromwell's alliance. Cromwell wisely inclined towards France, for Spain was then a greater menace to France and England, and the growth of British trade in the western-hemisphere; but as no concessions could be gained from either France or Spain, the year 1654 closed without a treaty being made with either. In December 1654 Penn and Venables sailed for the West Indies with orders to attack the Spanish colonies and the French shipping; and for the first time since the Plantagenets an English fleet appeared in the Mediterranean, where Blake upheld the supremacy of the English flag, made a treaty with the dey of Algiers, destroyed the castles and ships of the dey of Tunis at Porto Farina on the 4th of April 1655, and liberated the English prisoners captured by the pirates.

The incident of the massacre of the Protestant Vaudois at this time decided Cromwell's policy in favour of France. In response to Cromwell's splendid championship of the persecuted people—which has been well described as "one of the noblest memories of England"—France undertook to put pressure upon Savoy, in consequence of which the persecution ceased for a time; but Cromwell's intervention had less practical effect than it has generally been supposed, though it served to give the great conception of a world with state having duties along which interest more magnanimously realized." The treaty of Pinerolo withdrew the edict ordering the persecutions, but they were soon afterwards renewed, and in 1658 formed the subject of another remonstrance by Cromwell to Louis XIV. in his last extant public letter before his death. The treaty of Westminster (24th of October 1655) dealt chiefly with commercial subjects, and contained a clause promising the expulsion from France of political exiles. Meanwhile the West Indian expedition had been defeated at Hispaniola, and war was declared by Spain, who now promised help to Charles II. for regaining his throne. Cromwell sent powerful English fleets to watch the coast of Spain, and to prevent communications with the West Indies and America; on the 8th of September 1656 a fleet of treasure ships was destroyed off Cadiz by Stanyer, and on the 20th of April 1657 Blake performed his last exploit in the destruction of the whole Spanish fleet of sixteen treasure ships in the harbour of Santa Cruz in Teneriffe. These naval victories were followed by a further military alliance with France against Spain, termed the treaty of Paris (the 23rd of March 1657). Cromwell furnished 6000 men with a fleet to join in the attack upon Spain in Flanders, and obtained as reward Mardyke and Dunkirk, the former being captured and handed over on the 3rd of October 1657, and the latter after the battle of the Dunes on the 4th of June 1658, when Cromwell's Ironsides were once more pitied against English royalists fighting for the Spaniards.

Such was the character of Cromwell's policy abroad. The inspiring principle had been the defence and support of Protestantism, the question with Cromwell being "whether the Christian world should be all popery." He desired England to be everywhere the protector of the oppressed and the upholder of "Christian liberty." In principle the policy of Elizabeth, of Gustavus Adolphus, and—in the following generation—of William of Orange. He appreciated, without overestimating, the value of England's insular position. "You have accounted yourselves happy," he said in January 1658, "in being environed by a great ditch from all the world beside. Truly you will not be able to keep your ditch nor your shipping unless you turn your ships and shipping into troops of horse and companies of foot, and fight to defend yourselves on terra firma." He did not regard himself merely as the trustee of the national resources. These were not to be employed for the advancement of English interests alone. "God's interest in the world," he declared, "is more extensive than all the people of these three nations. God has brought us hither to consider the work we may do in the world as well as at home." In 1653 he had made the astonishing proposal to the Dutch that England and Holland should divide the habitable globe outside Europe between them, that all states maintaining the Inquisition should be treated as enemies by both the proposed allies, and that the former should send missionaries to all peoples willing to receive them, to inculcate the truth of Jesus Christ and the Holy Gospel. Great writers like Milton and Harrington supported Cromwell's view of the duty of a statesman; the poet Waller acclaimed Cromwell as "the world's protector"; but the London tradesmen complained of the loss of their Spanish trade and regarded Holland and not Spain as the national enemy. But Cromwell's dream of putting himself at the head of European Protestantism never even approached realization. War broke out between the Protestant states of Sweden, Denmark, Holland and Brandenburg, with whom religion was entirely subordinated to individual aims and interests, and who were far from rising to Cromwell's great conceptions; while the Vaudois were soon subjected to fresh persecutions. On the other hand, Cromwell could justly boast "there is not a nation in Europe but is very willing to ask a good understanding with you." He raised England to a predominant position among the Powers of Europe, and anticipated the triumphs of the elder Pitt. "It was hard to discover," wrote Clarendon, "which feared him most, France, Spain or the Low Countries." The vigour and success with which he organized the English resources and upheld the national honour, asserted the British sovereignty of the seas, defeated the oppressed, and caused his name to be feared and respected in foreign courts where that of Stuart was despised and neglected, command praise and admiration equally from contemporaries and from modern critics, from his friends and from his opponents. "He once more joined us to the continent," wrote Marvell, while Dryden describes him as teaching the British lion to roar. "Cromwell's greatness at home," said Clarendon, "was a mere shadow of his greatness abroad." "It is strange," wrote Pepys in 1667 under a different régime, "how everybody nowadays reflect upon Oliver and

1 John Morley, Oliver Cromwell, p. 483.
command him, what brave things he did, and made all the neighbour princes for him." To Cromwell more than to any other British ruler belongs the credit of having laid the foundation of England's maritime supremacy and of her over-sea empire.

Cromwell's colonial policy aimed definitely at the recognition and extension of the British empire. By March 1652 the whole of the territory governed by the Stuarts had submitted to the authority of the Commonwealth, and the Navigation Act of the 9th of October 1651, by which colonial goods could only be imported to England in British ships and all foreign trade to the colonies was restricted to products of the exporting country, sought to bind the colonies to England and to support the interests of the shipowners and merchants, and therefore of the English maritime supremacy, the act being, moreover, memorable as the first public measure which treated the colonies as a whole and as an integral part of Great Britain. The hindrance, however, to the general development of trade which the act involved aroused at once loud complaints, to which Cromwell turned a deaf ear, continuing to seize Dutch ships trading in forbidden goods. In the internal administration of the colonies Cromwell interfered very little, maintaining specially friendly relations with the New Englanders, and showing no jealousy of their desire for self-government. The war with France, Holland and Spain offered opportunities of gaining additional territory. A small expedition sent to the Leeward Islands in February 1654 to capture New Amsterdam (New York) from the Dutch was abandoned on the conclusion of peace, and the fleet turned to attack the French colonies; Major Robert Sedgwick taking with a handful of men the fort of St John's, Port Royal or Annapolis, and the French fort on the river Penobscot, the whole territory from this river to the mouth of the St Lawrence remaining British territory till its cession in 1667. In December 1654 Cromwell despatched Penn and Venables with a fleet of thirty-eight ships and 2,500 soldiers to the West Indies, their numbers being raised by recruits at the islands to 7,000 men. The attack on Hispaniola, however, was a disastraous failure, and though a landing at Jamaica and the capture of the capital, Santiago de la Vega, was effected, the expedition was almost annihilated by disease; and Penn and Venables returned to England, when Cromwell threw them into the Tower. Cromwell, however, persevered, reminding Fortescue, who was left in command, that the war was one against the "Roman Babylon," that they were "fighting the Lord's battles"; and he sent out reinforcements under Sedgwick, offering inducements to the New Englanders to migrate to Jamaica. In spite of almost instant defection, the colonists took 120 troops under Deleers, and the fleet lay in wait for the Spanish treasure ships, the settlements of the Spaniards were raided, and their repeated attempts to retake the island were successfully resisted. In 1668 Colonel Edward Doyley, the governor, gained a decisive victory over thirty companies of Spanish foot, and sent ten of their flags to Cromwell. The Protector, however, did not live to witness the final triumph of his undertaking, which gave to England, as he had wished, "the mastery of those seas," ensuring the English colonies against Spanish attacks, and being maintained and followed up at the Restoration.

Meanwhile, the first parliament of the Protectorate had met in September 1654. A scheme of electoral reform had been carried by which members were taken from the small and corrupt boroughs and given to the large hitherto unrepresented towns, and which provided for thirty representatives from Scotland and from Ireland.

Instead, however, of proceeding with the work of practical legislation, accepting the Instrument of Government without challenge as the basis of its authority, the parliament immediately began to discuss and find fault with the constitution and to question about "Fundamentals." About two hundred members who refused to engage not to attempt to change the form of government were excluded on the 18th of September. The rest sat on, discussing the constitution, drawing up lists of damnable heresies and of incontrovertible articles of faith, producing plans for the reduction of the army and demanding

for themselves its control. Incensed by the dilatory and factious proceedings of the House, Cromwell dismissed the parliament on the 22nd of January 1655. Various dangerous plots against his government and person were at this time. Vane, Ludlow, Robert Overton, Harrison and Major Wildman, the head of the Levellers, were all arrested, while the royalist rising under Pennrugg was crushed in Devonshire. Other attacks upon his authority were met with the same resort to force. The judges and lawyers began to question the legality of his ordinances, and to doubt their competency to convict royalist prisoners of treason. A merchant named Coney refused to pay customs not imposed by parliament, his counsel declaring their levy by ordinance to be contrary to Magna Carta, and Chief Justice Rolle resigning in order to avoid giving judgment. Cromwell was thus inevitably drawn farther along the path of arbitrary government. He arrested the persons who refused to pay taxes, and sent Coney's lawyers to the Tower. Hitherto he had been scrupulously impartial in raising the best men to the judicial bench, including the illustrious Matthew Hale, but he now appointed compliant judges, and, alluding to Magna Carta in terms impossible to transcribe for modern readers, declared that "it should not control his actions which he knew were for the safety of the Commonwealth." The country was now divided into twelve districts each governed by a major-general, to whom the men of the districts, and in his absence all and every of whom, were put upon the field-without other authority, stamping out disaffection and plots, and extending the laws relating to public morals. They had power to transport royalists and those who could not produce good characters, and supported themselves by a special tax of 10% on the incomes of the royalist gentry. Enormous numbers of ale-houses were closed—a proceeding which excited intense resentment and was probably no slight cause of the royalist reaction. Still more serious an encroachment upon the constitution perhaps even than the institution of the major-generals was Cromwell's tampering with the municipal franchise by confiscating the charters, depriving the burgesses, now hostile to his government, of their parliamentary votes, and limiting the franchise to the corporation; thereby corrupting the national liberties at their very source, and introducing an evil precedent only too readily followed by Charles II. and James II.

It was in these embarrassed and perilous circumstances that Cromwell summoned a new parliament in the summer of 1656. In spite of the influence and interference of the major-generals a large number of members hostile to the government were returned, of whom Cromwell's friends received barely half of their number. The minor-generals were the object of general attack, while the special tax on the royalists was declared unjust, and the bill for its continuation rejected by a large majority. An attempt at the assassination of Cromwell by Miles Sindercombe added to the general feeling of anxiety and unrest. The military rule excited universal hostility; there was an earnest desire for a settled and constitutional government, and the revival of the monarchy in the person of Cromwell appeared the only way of obtaining it. On the 23rd of February 1657 the Remonstrance offering Cromwell the crown was moved by Sir Christopher Packe in the parliament and violently resisted by the officers and the army party, one hundred officers waiting upon Cromwell on the 27th to petition against his acceptance of it. On the 25th of March the Remonstrance, now termed the Petition and Advice, and including a new scheme of government, was passed by a majority of 123 to 62 in spite of the opposition of the officers; and on the 31st it was presented to Cromwell in the Banqueting House at Whitehall whence Charles I. had stepped out on to the scaffold. Cromwell replied by requesting a brief delay to ask counsel of God and his own heart. On the 8th of May about thirty officers presented a petition to parliament requesting the revival of the monarchy, and Fleetwood, Desborough and Lambert threatened to lay down their commissions. Accordingly Cromwell the same day refused the crown definitely, greatly to the astonishment both of his followers and his enemies, who considered his decision a fatal neglect of an opportunity of
consolidating his rule and power. In particular, his acceptance of the crown would have guaranteed his followers, under the act of Henry VII, from liability in the future to the charge of high treason for having given allegiance to himself as a de facto king. Cromwell himself, however, seems to have regarded the question of title as of secondary importance, as merely (to use his own words) "a feather in the hat," "a shining bauble for crowds to gaze at or kneel to." "Your father," wrote Sir Francis Russell to Henry Cromwell, "hath of late made more wise men fools than ever; he laughs and is merry, but they hang down their heads and are pitifully out of countenance."

On the 25th of May the petition was presented to Cromwell again, with the title of Protector substituted for that of King, and he now accepted it. On the 26th of June 1657 he was once more installed as Protector, this time, however, with regal ceremony in contrast with the simple formalities observed on the first occasion, the heralds proclaiming his accession in the same manner as that of the kings. Cromwell's government seemed now established on the firmer footing of law and national approval, he himself obtaining the powers though not the title of a constitutional monarch, with a permanent revenue of £1,300,000 for the ordinary expenses of the government, the coronation of the Protector being a formal ceremony in which his subjects participated and subject to the approval of parliament, the members of the council and of the new second chamber now established, while at the same time the freedom of parliament was guaranteed in its elections. Difficulties, however, appeared immediately the parliament got to work. The republicans hostile to the Protectorate, excluded before, now returned, took the places vacated by strong supporters of Cromwell who had been removed to the Lords, and attacked the authority of the new chamber, opened communications with the disaffected in the city and army, protested against unparliamentary taxation and arbitrary imprisonment, and demanded again the supremacy of parliament. In consequence Cromwell summoned both Houses to his presence on the 4th of February 1658, and having pointed out the perils to which they were once more exposing the state, dissolved parliament, dismissing the members with the words, "let God be judge between me and you."

During the period following the dissolution Cromwell's power appeared unassailable at least to be at its height. The revolt of Charles II's supporters in Ireland, against his government had been easily suppressed, and the various attempts to assassinate him, contemptuously referred to by Cromwell as "little fiddling things," were anticipated and prevented by an excellent system of police and spies, and by his bodyguard of 150 men. The victory at Dunkirk increased his reputation, while Louis XIV. showed his respect for the ruler of England by the splendid reception given to the Protector's envoy, Lord Fauconberg, and by a complimentary mission despatched to England.

The great career, the incidents of which we have been following, was now, however, drawing to a close. Cromwell's health had long been impaired by the hardships of campaigning. Now at the age of 58 he was already old, and his firm, strong signature had become feeble and trembling. The responsibilities and anxieties of government unassisted by parliament, and the continued struggle against the force of anxiety, weighed upon him and exhausted his physical powers. "It has been hitherto," Cromwell said, "a matter of, I think, but philosophical discourse, that a great place, a great authority, is a great burden. I know it is." "I can say in the presence of God, in comparison of whom we are but like poor creeping ants upon the earth, I would have lived under my woodslee to have kept a flock of sheep rather than undertook such a government as this." "I doubt not to say," declared his steward Maidston, "it drank up his spirits, of which his natural constitution afforded a vast stock, and brought him to his grave."

Domestic bereavements added further causes of grief and of weakened vitality. On the 6th of February 1658 he lost his favourite daughter, Elizabeth Claypole, and he was much cast down by the shock of his bereavement and of her long sufferings. Shortly afterwards he fell ill of an intermittent fever, but seemed to recover. On the 20th of August George Fox met him riding at the head of his guards in the park at Hampton Court, but declared "he looked like a dead man." The next day he again fell ill and was removed from Hampton Court to Whitehall, where his condition became worse. The anecdotes believed and circulated by the royalists that Cromwell died in all the agonies of remorse and fear are entirely false. On the 31st of August he seemed to rally, and one who slept in his bedchamber and who heard him praying, declared, "a public spirit to God's cause did breathe in him to the very last." During the next few days he grew weaker and resigned himself to death. "I would," he said, "be willing to be further serviceable to God and his people, but my work is done." For the first time doubts as to his spiritual state seemed to have troubled him. "Tell me is it possible to fall from grace?" he asked the attendant minister. "No, it is not possible," the latter replied. "Then," said Cromwell, "I am safe, for I know that I was once in grace."

He refused medicine to induce sleep, declaring "it is not my design to drink or to sleep, but my design is to make what haste I can to be gone." Towards the morning of the 3rd of September he again spoke, "using divers holy expressions, implying much inward consolation and peace," together with "some exceeding words of comfort" at the prospect of his death. He died on the afternoon of the same day, his day of triumph, the anniversary both of Dunbar and of Worcester. His body was privately buried in the chapel of Henry VII. in Westminster Abbey, the public funeral taking place on the 23rd of November, with great ceremony and on the same scale as that of Philip II. of Spain, and costing the enormous sum of £60,000. At the Restoration his body was exhumed, and on the 30th of January 1661, the anniversary of the execution of Charles I., it was drawn on a sledge from Holborn to Tyburn, together with the bodies of Ireton and Bradshaw, accompanied by "the universal outcry and curses of the people." There it was hanged on a gallows, and in the evening taken down, when the head was cut off and set up upon Westminster Hall, where it remained till as late as 1684, the trunk being thrown into a pit underneath the gallows. According to various legends Cromwell's last burial place is stated to be Westminster Abbey, Naseby Field or Newburgh Abbey; but there appears to be no evidence to support the view that he create any reasonable doubt that the great Protector's dust lies now where his body was buried, in the neighbourhood of the present Connaught Square.

As a military commander Cromwell was as prompt as Gustavus, as ardent as Condé, as exact as Turenne. These, moreover, were soldiers from their earliest years. Condé's fame was established in his twenty-second year, Gustavus was twenty-seven and Turenne thirty-three at the beginning of their careers as commanders-in-chief. Cromwell, on the other hand, was forty-three when he fought in his first battle. In less than two years he had taken his rank as one of the great cavalry leaders of history. His campaigns of 1648 and 1653 placed him still higher as a great commander. Worcester, his crowning victory, has been indicated by a German critic as the prototype of Sédan. Yet his early military education could have consisted at most of the perusal of the Swedish Intelligencer and the practice of riding. It is not, therefore, strange that Cromwell's first essays in war were characterised more by energy than technical skill. It was some time before he realized the spirit of cavalry tactics, of which he was later so complete a master. At first he speaks with complaisance of a mårde, and reports that he and his men "agreed to charge," the enemy. But before long he came to understand, as no other commander of the age save Gustavus understood it, the value of true "shock-action." Of Marston Moor he writes, "we never charged but we routed them;" and thereafter his battles were decided by the shock of closed squadrons, the fresh impulse of a second and even a third line, and above all by the unquestioning discipline and complete control over their horses to which he trained his men. This gave them not merely greater steadiness, but, what was far more important, the power of rallying and performing for a second effort. The Royalist cavalry was
Cromwell, Oliver

disorganized by victory as often as by defeat, and illustrated on numerous fields the now discredited maxim that cavalry cannot charge twice in one day. Cromwell shares with Frederick the Great the credit of founding the modern cavalry spirit. As a horsemaster he was far superior to Murat. His marches in the eastern campaign of 1643 show a daily average at one time of 28 m. as against the 21 of Murat's cavalry in the celebrated pursuit after Jena. And this result he achieved with men of less than two years' service, men, too, more heavily equipped and worse mounted than the veterans of the Grande Armée. It has been said that his battles were decided by shock action; the real emphasis should be laid upon the word "decided." The swift, unhesitating charge was more than unusual in the wars of the time, and was possible only because of the peculiar earnestness of the men who fought the English war. The professional soldiers of the Continent could rarely be brought to force a decision; but the English, contending for a cause, were imbued with the spirit of the modern "nation in arms"; and having taken up arms wished to decide the quarrel by arms. This feeling was not less conspicuous in the far-ranging rides, or raids, of the Cromwellian cavalry. At one time, as in the case of Blechington, they would perform strange expéits worthy of the most daring husars; at another their speed and tenacity paralysed armies. Not even Sheridan's horsemen in 1864 did their operation more effectively than the English horsemen in the Preston campaign. Cromwell appreciated this feeling at its exact worth, and his pre-eminence in the Civil War was due to this highest gift of a general, the power of feeling the pulse of his army. Resolution, vigour and clear sight marked his conduct as a commander-in-chief. He aimed at nothing less than the annihilation of the enemy's forces, which Clausewitz was the first to define, a hundred and fifty years later, as the true objective of military operations. Not merely as exemplifying the tactical envelopment, but also as embodying the central idea of grand strategy, was Worcester the prototype of Sédan.

The contrast between a campaign of Cromwell's and one of Turenne's is far more than remarkable, and the observation of a military critic who maintains that Cromwell's art of war was two centuries in advance of its time, finds universal acceptance. At a time when throughout the rest of Europe armies were manoeuvring against one another with no more than a formal result, the English and Scots were fighting decisive battles; and Cromwell's battles were more decisive than those of any other leader. Until his fiery energy made itself felt, hardly any army on either side actually suffered rout; English horsemen, and Naseby the troops of the defeated party were completely dissolved, while at Worcester the royalist army was annihilated. Dunbar attested his constancy and gave proof that Cromwell was a master of the tactics of all arms. Preston was an example like Austerlitz of the two stages of a battle as defined by Napoleon, the first flottante, the second foulbroyante.

Cromwell's strategic manoeuvres, if less adroit than those of Turenne or Montecuccoli, were, in accordance with his own genius and the temper of his army, directed always to forcing a decisive battle. That he was also capable of strategy of the other type was clear from his conduct of the Irish War. But his chief work was of a different kind and done on a different scale. The greatest feat of Turenne was the rescue of one province in 1674-1677; Cromwell, in 1648 and again in 1651, had two-thirds of England and half of Scotland for his theatre of war. Turenne levelled down his methods to suit the ends which he had in view. The task of Cromwell was far greater. Any comparison between the generalship of these two great commanders would therefore be misleading, for want of a common basis. It is when his genius is contrasted with other commanders, not of the age of Louis XIV., but of the Civil War, that Cromwell's greatness is most conspicuous. Whilst others busied themselves with the application of the accepted rules of the Dutch, the German, and other formal schools of tactical thought, Cromwell almost alone saw clearly into the heart of the questions at issue, and evolved the strategy, the tactics, and the training suited to the work to which he had set his hand.

Cromwell's career as a statesman has been already traced in its different spheres, and an endeavour has been made to show the breadth and wisdom of his conceptions and at the same time the cause of the immediate failure of his constructive policy. Whether if Cromwell had survived he would have succeeded in gradually establishing a legal government is a question which can never be answered. His administration as it stands in history is undoubtedly open to the charge that after abolishing the absolutism of the ancient monarchy he substituted for it, not law and liberty, but a military tyranny far more despotic than the most arbitrary administration of Charles I. The statement of Vane and Ludlow, when they refused to acknowledge Cromwell's government, that it was "in substance a re-establishment of that which we all engaged against," was true. The levy of ship money and customs by Charles sinks into insignificance beside Cromwell's wholesale taxation by ordinances; the inquisitional methods of the major-generals and the unjust and exceptional taxation of royalists outdid the scandals of the extra-legal courts of the Stuarts; the shipment of British subjects by Cromwell as slaves to Barbados has no parallel in the Stuart administration; while the prying into morals, the encouragement of informers, the attempt to make the people religious by force, were the counterpart of the Laudian system, and Cromwell's Draconian treatment of the Irish Catholics formed another side of the same system. He discovered that parliamentary government after all was not the easy and plain task that Pym and Vane had imagined, and Cromwell had in the end no better justification of his rule than that which Strafford had suggested to Charles I., "parliament refusing (to give support and co-operation in carrying on the government) you are acquitted before God and man." The fault was no doubt partly Cromwell's own. He had neither the patience nor the tact for managing loquacious parliamentary pelicans. But the chief responsibility was not his but theirs. John Morley (Oliver Cromwell, p. 297) has truly observed of the execution of Charles I., that it was "an act of war, and was just as defensible or just as assailable, and on the same grounds, as the war itself." The parliamentary party took leave of legality when they took up arms against the sovereign, and it was therefore idle to dream of a formally legal sanction for any of their subsequent revolutionary proceedings. An entirely fresh start had to be made. A new foundation had to be laid on which a new system of legality might be reared. It was for this that Cromwell strove. If the Rump or the Little Parliament had had the spirit assumed and discharged the functions of a constituent assembly, such a foundation might have been provided. It was only when five years had passed since the death of the king without any "settlement of the nation" being arrived at, that Cromwell at last accepted a constitution drafted by his military officers, and attempted to impose it on the parliament. And it was not until the parliament refused to acknowledge the Instrument as the required starting point for the new legality, that Cromwell in the last resort took arbitrary power into his hands as the only method remaining for carrying on the government. For much as he hated arbitrariness, he hated anarchy still more. While therefore Cromwell's administration became in practice little different from that of Strafford, the aims and ideals of the two statesmen had nothing in common. It is therefore profoundly true, as observed by S. R. Gardiner (Cromwell, p. 315), that "what makes Cromwell's biography so interesting in his perpetual effort to walk in the paths of legality—an effort always frustrated by the necessities of the situation. The man—it is ever so with the noblest—was greater than his work." The nature of Cromwell's statesmanship is to be seen rather in his struggles against the retrograde influences and opinions of his time, in the many political reforms anticipated though not originated or established by himself, and in his religious, perhaps fanatical, enthusiasm, than in the outward character of his administration, which, however, in spite of its despoticism shows itself in its inner spirit of justice, patriotism and self-sacrifice, so immeasurably superior to that of the Stuarts.
Cromwell's personal character has been inevitably the subject of unceasing controversy. According to Clarendon he was "a brave bad man," with "all the wickedness against which damnation is pronounced and for which hell fire is prepared." Yet he cannot deny that "he had some virtues which have caused the memory of some men in all ages to be celebrated"; and admits that "he was not a man of blood," and that he possessed "a wonderful understanding in the natures and humour of men," and "a great spirit, an admirable circumspection and sagacity and a most magnanimous resolution." According to contemporary republicans he was a mere selfish adventurer, sacrificing the national cause "to the idol of his own ambition." Richard Baxter thought him a good man who fell before a great temptation. The writers of the next century generally condemned him as a mixture of knave, fanatic and hypocrite, and in 1659 John Forster endorsed Landor's verdict that Cromwell lived a hypocrite and died a traitor. These crude ideas of Cromwell's character were extinguished by Macaulay's irresistible logic, by the publication of Cromwell's letters by Carlyle in 1845, which showed Cromwell clearly to be "not a man of falsehoods, but a man of truth"; and by Gardiner, whom, however, it is somewhat difficult to follow when he represents Cromwell as "the typical Englishman." In particular, the conception which regarded "ambition" as the motivating motive in his career has been dispelled by a more intimate and accurate knowledge of his life; this shows him to have been very little the creator of his own career, which was largely the result of circumstances outside his control, the influence of past events and of the actions of others, the pressure of the national will, the natural superiority of his own genius. "A man never mounts so high," Cromwell said to the French ambassador in 1647, "as when he does not know where he is going." "These issues and events," he said in 1656, "have not been forecast, but were providences in things." His "hypocrisy," consists principally in the Biblical language he employed, which with Cromwell, as with many of his contemporaries, was the most natural way of expressing his feelings, and in the ascription of every incident to the direct intervention of God's providence, which was really Cromwell's sincere belief and conviction. In later times Cromwell's character and administration have been the subject of almost too indiscriminate eulogy, which has found tangible shape in the statue erected to his memory in Westminster in 1890. Here Cromwell's effigy stands in the midst of the sanctuaries of the law, the church, and the parliament, the three foundations of the state which he subverted, and in sight of Whitehall where he destroyed the monarchy in blood. Yet Cromwell's monument is not altogether misplaced in such surroundings, for in him are found the true principles of piety, of justice, of liberty and of governance.

John Maidston, Cromwell's steward, gives the "character of his person." "His body was compact and strong, his stature under six foot (I believe about two inches), his head so shaped as you might see it a storehouse and a shop both of a vast treasury of natural parts." "His temper exceeding fiery, as I have known, but the flame of it, . . . kept down for the most part, was allayed with those moral endowments he had. He was naturally compassionate towards objects in distress even to an effeminate measure; though God had made him a heart wherein was little room for fear, . . . yet did he exceed in tenderness towards sufferers. A larger soul I think hath seldom dwelt in a house of clay than he was. I believe if his story were impartially transmitted and the unprejudiced world well possessed with it, she would add him to her nine worthies." By his wife Elizabeth Bourchier, Cromwell had four sons, Robert (who died in 1639), Oliver (who died in 1644 while serving in his father's regiment), Richard, who succeeded him as Protector, and Henry. He also had four daughters. Of these Bridget was the wife successively of Ireton and Fleetwood, Elizabeth married John Claypole, Mary was wife of Thomas Belassey, Lord Fauconberg; and Frances was the wife of Sir Robert Rich, and secondly of Sir John Russell. The last male descendant of the Protector was his great-great-grandson, Oliver Cromwell of Cheshunt, who died in 1821. By the female line, through his children Henry, Bridget and Frances, the Protector has had numerous descendants, and is the ancestor of many well-known families.

**BIBLIOGRAPHY.**—A detailed bibliography, with the chief authorities for the different periods, was found in the article in the Dict. of Nat. Biography, by C. H. Firth (1888). The following works may be mentioned: S. R. Gardiner's Hist. of England (1883-1884) and of the Great Civil War (1886), Cromwell's Place in History (1897), Oliver Cromwell (1899), D. B. H. Hoenig, Cromwell's Speeches (1894-1903); Cromwell, by C. H. Firth (1900); Oliver Cromwell, by J. Morley (1904); The Last Years of the Protectorate, 1650-1653, 2 vols., by C. H. Firth (1909); Oliver Cromwell, by F. R. D. Palgrave (1890), Cromwell (1897), and Distinctive Questions about Cromwell (1859), by S. C. Lomas, with an introd. by C. H. Firth (the best edition, reprinting the spurious Squire papers, 1904); Oliver Cromwell, by F. Hoenig (1857); Oliver Cromwell, the Protector, by R. F. D. Palgrave (1890); Cromwell (1897), and Distinctive Questions about Cromwell (1859), by J. Morley (1899), by the same author (1905); Oliver Cromwell, by Theodore Roosevelt (1900); Oliver Cromwell, by R. Pauli (1888); Cromwell, a Speech delivered at the Cromwell Tercentenary Celebration 1899, by Lord Rosebery (1899); The Two Protectors, by Sir Richard Trench, invaluable for its illustrations (1890); Life of Sir Henry Vane, by W. W. Ireland (1905); Die Politik des Protectors Oliver Cromwell in der Auffassung und Tätigkeit des Staatssekretärs John Thurloe, by Freiherr v. Bischofshausen (1896); Cromwell as a Soldier, by T. S. Roosevelt (1901), The Diplomatic Relations between Cromwell and Charles X. of Sweden, by G. Jones (1897); The Interregnum, by F. A. Inverdick (dealing with the legal aspect of Cromwell's rule, 1891); Administration of the Royal Navy, by Sir Charles Firth (1896); The Englishman in the Civil Wars, by W. Shaw (1900); The Protestant Interest in Cromwell's Foreign Relations, by J. N. Bowman (1900); Cromwell's Jewish Intelligences, by H. C. J. Posner (1894); Crypto-Jews under the Commonwealth (1894), by F. C. E. and Menasseh Ben Israel's Mission to Oliver Cromwell (1901), by R. J. M. (P. C. Y.; C. F. A.; R. J. M.)

**CROMWELL, RICHARD** (1626-1712), lord protector of England, eldest surviving son of Oliver Cromwell and of Elizabeth Bourchier, was born on the 4th of October 1626. He was adopted in infancy by John Cromwell, who admitted him a member of Lincoln's Inn. In 1649 he married Dorothy, daughter of Richard Mayor, or Major, of Hursley in Hampshire. He represented Hampshire in the parliament of 1654, and Cambridge University in that of 1656, and in November 1655 was appointed one of the council of trade. But he was not brought forward by his father or prepared in any way for his future greatness, and lived in the country occupied with field sports, till after the institution of the second protectorate in 1657 and the recognition of Oliver's right to name his successor. On the 18th of July he succeeded his father as chancellor of the university of Oxford, on the 31st of December he was made a member of the council of state, and about the same time obtained a regiment and a seat in Cromwell's House of Lords. He was received generally as his father's successor, and was nominated by him as such on his death-bed. He was proclaimed on the 3rd of September 1658, and at first his accession was acclaimed with general favour both at home and abroad. Dissensions, however, soon broke out between the military faction and the civilians. Richard's election, not being "general of the army as his father was," was distasteful to the officers, who desired the appointment of a commander-in-chief from among themselves, a request refused by Richard. The officers in the council, moreover, showed jealousy of the civil members, and to settle these difficulties and to provide money a parliament was summoned on the 27th of January 1659, which declared Richard protector, and incurred the hostility of the army by criticizing severely the arbitrary military government of Oliver's last two years, and by impeaching one of the major-generals. A council of the army accordingly established itself in opposition to the parliament, and demanded on the 6th of April a justification and confirmation of former proceedings, to which the parliament replied by forbidding meetings of the army council without the permission of the protector, and insisting that all officers should take an oath not to disturb the proceedings in parliament. The army now broke into open rebellion and assembled at St James's. Richard was completely in their power; he identified himself with their cause, and the same night dissolved the parliament. The Long

Parliament (which re-assembled on the 7th of May) and the heads of the army came to an agreement to effect his dismissal; and in the subsequent events Richard appears to have played a purely passive part, refusing to make any attempt to keep his power or to forward a restoration of the monarchy. On the 25th of May his submission was communicated to the House. He retired into private life, heavily burdened with debts incurred during his tenure of office and narrowly escaping arrest even before he quitted Whitehall. In the summer of 1660 he left England for France, where he lived in seclusion under the name of John Clarke, subsequently removing elsewhere, either (for the accounts differ) to Spain, to Italy, or to Geneva. He was long regarded by the government as a dangerous person, and in 1671 a strict search was made for him without avail. He returned to England about 1680 and lived at Cheshunt, in the house of Sergeant Pengeley, where he died on the 12th of July 1712, being buried in Hursley church in Hampshire. Richard Cromwell was treated with general contempt by his contemporaries, and invidiously compared with his great father. According to Mrs Hutchins he was "gentle and virtuous but a peasant in his nature and became not greatness." He was nevertheless a man of respectable abilities, of an irreproachable private character, and a good speaker.

Biography, and authorities there cited: Noble’s Memoirs of the Protectorate House of Cromwell (1785); Memoirs of the Protector ... and of his Sons, by O. Cromwell; and Red, the Two Protectors, by T. Keats; and a Short Life of Richard Cromwell, by W. T. Warren (1900): Letters and Speeches of O. Cromwell, by T. Carlyle (1904); Eng. Hist. Review, xii. 93 (letters) and xviii. 79; Cal. of State Papers, Domestic, Lansdown MSS., in British Museum. (F. C. Y.)

CROMWELL, THOMAS, EARL OF ESSEX (1485?—1540), born probably not later than 1485 and possibly a year or two earlier, was the only son of Walter Cromwell, alias Smyth, a brewer, smith and fuller of Putney. His grandfather, John Cromwell, seems to have belonged to the Nottinghamshire family, of whom the most distinguished member was Ralph, Lord Cromwell (1174–1240), treasurer and marshal of England from 1208 to 1216, and who together with his son moved from Norwell, Co. Norfolk, to Wimbledon some time before 1461. John’s son, Walter, seems to have acquired the alias Smyth from being apprenticed to his uncle, William Smyth, “armourer,” of Wimbledon. He was of a turbulent, vicious disposition, perpetually being fined in the manor-court for drunkenness, for evading the assize of beer, and for turning more than his proper number of beasts on to Putney Common. Once he was punished for a sanguinary assault, and his connexion with Wimbledon ceased in 1514 when he “falsely and fraudulently erased the evidences and terrures of the lord.” Till that time he had flourished like the bay-tree.

Under these circumstances the absence of Thomas Cromwell’s name from the Wimbledon manor rolls is almost a presumption of respectability. Perhaps it would be safer to attribute it to Cromwell’s absence from the manor. He is said to have quarrelled with his father—no great crisis in the cardinal’s character—then to have moved to Italy, where he served as a soldier in the French army at the battle of the Garigliano (Dec. 1503). He escaped from the battle-field to Florence, where he was befriended by the banker Frescobaldi, a debt which he appears to have repaid with superabundant interest later on. He is next heard of at Antwerp as a trader, and about 1516 he was induced to accompany a Bostonian to Rome in quest of some papal indulgences for a Boston gold; Cromwell secured the boon by the timely present of some choice sweetmeats to Julius II. In 1512 there is some slight evidence that he was at Middelburg, and also in London, engaged in business as a merchant and solicitor. His marriage must have taken place about the same time, judging from the age of his son Gregory. His wife was Elizabeth Wykes, daughter of a well-to-do sheepman of Putney, whose business Cromwell carried on in combination with his own.

For about eight years after 1512 we hear nothing of Cromwell. A letter to him from Cicely, marchioness of Dorset, in which he is seen in confidential business relations with her ladyship, is probably earlier than 1520, and it is possible that Cromwell owed his introduction to Wolsey to the Dorset family. On the other hand, it is stated that his cousin, Robert Cromwell, vicar of Battersea under the cardinal, gave Thomas the stewardship of the archiepiscopal estate of York House. At any rate he was advising Wolsey on legal points in 1520, and from that date he occurs frequently not only as mentor to the cardinal, but to noblemen and others when in difficulties, especially of a financial character; he made large sums as a money-lender.

In 1523 Cromwell emerges into public life as a member of parliament. The official returns for this election are lost and it is not known for what constituency he sat, but we have a humorous letter from Cromwell describing its proceedings, and a remarkable speech which he wrote and perhaps delivered, opposing the reckless war with France and indicating a sounder policy which was pursued after Wolsey’s fall. If, he said, war was to be waged, it would be better to secure Boulogne than advance on Paris; if the king went in person and were killed without leaving a male heir, he hinted there would be civil war; it would be wiser to attempt a union with Scotland, and in any case the proposed subsidy would be a fatal drain on the resources of the realm. Neither Henry nor Wolsey was so foolish as to resent this criticism, and Cromwell lost nothing by it. He was made a collector of the subsidy he had opposed—a doubtful favour perhaps—and in 1524 was admitted at Gray’s Inn; but he now became the most confidential servant of the cardinal.

In 1525 he was Wolsey’s agent in the dissolution of the smaller monasteries which were designed to provide the endowments for Wolsey’s foundations at Oxford and Ipswich, a task which gave Cromwell a taste and a facility for similar enterprises on a greater scale later on. For these foundations Cromwell drew up the necessary deeds, and he was receiver-general of cardinal’s college, constantly supervising the workmen there and at Ipswich. His ruthless vigour and his accessibility to bribes earned him such unpopularity that there were rumours of his projected assassination or imprisonment. All this constituted a further bond of sympathy between him and his master, and Cromwell grew in Wolsey’s favour until his fall. His wife had died in 1527 or 1528, and in July 1520 he made his will, in which one of the chief beneficiaries was his nephew, Richard Williams, alias Cromwell, the great-grandfather of the protector.

Wolsey’s disgrace reduced Cromwell to such despair that Cavendish once found him in tears and at his prayers “which had been a strange sight in him afore.” Many of the cardinal’s servants had been taken over by the king, but Cromwell had made himself particularly obnoxious. However, he rode to court from Esher to “make or mar,” as he himself expressed it, and offered his services to Norfolk. Possibly he had already paved the way by the pensions and grants which he induced Wolsey to make through him, out of the lands and revenues of his bishoprics and abbey, to nobles and courtiers who were hard pressed to keep up the lavish style of Henry’s court. Cromwell could be most useful to the government in parliament, and the government, represented by Norfolk, undertook to use its influence in procuring him a seat, on the next occasion understanding that Cromwell should do his best to further government business in the House of Commons. This was on the 2nd of November 1530; the elections had been made, and parliament was to meet on the morrow. A seat was, however, found or made for Cromwell at Taunton. He signalized himself by a powerful speech in opposition to the bill of attainder against Wolsey which had already passed the Lords. The bill was thrown out, possibly with Henry’s connivance, though no theory has yet explained its curious history so completely as the statement of Cavendish and other contemporaries, that its rejection was due to the arguments of Cromwell. Doubtless he championed his fallen chief not so much for virtue’s sake as for the impression it would make on others. He did not feel called upon to accompany Wolsey on his exile from the court.

Cromwell had now, according to Cardinal Pole, whose story has been too readily accepted, been converted into an “emissary of Satan” by the study of Machiavelli’s Prince. In the one interview which Pole had with Cromwell, the latter, so Pole
CROMWELL, THOMAS

wrote ten years later in 1530, recommended him to read a new Italian book on politics, which Pole says he afterwards discovered was Machiavelli's Prince. But this discovery was not made for some years: the Prince was not published until 1532, three years after the conversation; there is evidence that Cromwell was not acquainted with it until 1537 or 1539, and there is nothing in the Prince bearing on the precise point under discussion by Pole and Cromwell. On the other hand, the point is discussed in Castiglione's Il Cortegiano which had just been published in 1528, and of which Cromwell promised to lend Bonner a copy in 1530. The Cortegiano is the antithesis of the Prince; and there is little doubt that Pole's account is the offspring of an imagination heated by his own perusal of the Prince in 1538, and by Cromwell's ruin of the Pole family at the same time; until then he had failed to see in Cromwell the Machiavellian "emissary of Satan."

Equally fanciful is Pole's ascription of the whole responsibility for the Reformation to Cromwell's suggestion. It was impossible for Pole to realize the substantial causes of that perfectly natural development, and it was his cue to represent Henry as having acted at the diabolic suggestion of Satan's emissary. In reality the whole programme, the destruction of the liberties and confiscation of the wealth of the church by parliamentary agency, had been indicated before Cromwell had been appointed to the College of Imperial Concilia which had been created for Wolsey; laymen had supplanted ecclesiastics in the chief offices of state; the plan of getting a divorce without papal intervention had been the original idea, which Wolsey had induced the king to abandon, and it had been revived by Cranmer's suggestion about the universities. The root idea of the supreme authority of the king had been asserted in Tyndale's Obedience of a Christian Man published in 1528, which Anne Boleyn herself had brought to Henry's notice: "this," he said, "is a book for me and all kings to read," and Campeggio had felt compelled to warn him against these notions, of which Pole imagines that he had never heard until they were put into his head by Cromwell late in 1530.

In the same way Cromwell's influence over the government from 1529-1535 has been grossly exaggerated. It was not till 1531 that he was admitted to the privy council nor till 1534 that he was made secretary, though he had been master of the Jewel-House, clerk of the Hanaper and master of the Wards in 1533, and chancellor of the exchequer (then a minor office) in 1533. It is not till 1533 that his name is as much mentioned as in the correspondence of any foreign ambassador resident in London. In 1533, when the king's burning desire was to suppress, but no secrecy was made about Cranmer's suggestion, and it was not Henry's habit to assume a responsibility which he could devolve upon others. It is said that Cromwell's life would not have been safe, had he been known as the author of this policy; but that is not a consideration which would have appealed to Henry, and he was just as able to protect his minister in 1530 as he was in 1536. Cromwell, in fact, was not the author of that policy, but he was the most efficient instrument in its execution.

He was Henry's parliamentary agent; but even in this capacity his power has been overrated, and he is supposed to have invented those parliamentary complaints against the clergy, which were transmuted into the legislation of 1532. But the complaints were old enough, many of them had been heard in parliament nearly twenty years before, and there is ample evidence to show that the petition against the clergy represents the "infinite clamours" of the Commons against the Church, which the House itself resolved should be "put in writing and delivered to the king." The actual drafting of the statute, as of all the Reformation Acts between 1532 and 1539, was largely Cromwell's work; and the success with which parliament was managed during this period was also due to him. It was not an easy task, for the House of Commons more than once rejected government measures, and members were heard to threaten Henry VIII. with the fate of Richard III.; they even complained of Cromwell's reporting their proceedings to the king. That was his business rather than conveying imaginary royal orders to the House. "They be contented," he wrote in one of these reports, "that deed and writing shall be treason," but words were only to be misprision: they refused to include an heir's rebellion or disobedience in the bill "as rebellion is already treason, and disobedience is no cause of forfeiture of inheritance." There was, of course, room for manipulation, which Cromwell extended to parliamentary elections; but parliamentary opinion was a force of which he had to take account, and not a negligible quantity.

From the date of his appointment as secretary in 1534, Cromwell's biography belongs to the history of England, but it is necessary to define his personal attitude to the revolution in which he was the king's most conspicuous agent. He was included by Foxe in his Book of Martyrs to the Protestant faith: more recent historians regard him as a sacreligious ruffian. Now, there were two cardinal principles in the Protestantism of the 16th century—the supremacy of the temporal sovereign over the church in matters of government, and the supremacy of the Scriptures over the Church in matters of faith. There is no room for doubt as to the sincerity of Cromwell's belief in the first of these two articles; he paid at his own expense for an English translation of Marsiglio of Padua's Defense of Princes, the classic medieval advocate of that doctrine; he had a scheme for governing England and France in which the chief administrative councils were to be made up by the king and his chiefs, and it had been urged upon Henry the adoption of the maxim of the Roman civil law—quod principi placuit leges habere vigorem. He wanted, in his own words, "one body politic" and no rival to the king's authority; and he set the divine right of kings against the divine right of the papacy. There is more doubt about the sincerity of Cromwell's attachment to the second article; it is true that he set up a Bible in every parish church, and regarded them as invaluable; and the correspondents who unbosom themselves to him are all of a Protestant way of thinking. But Protestantism was the greatest support of absolute monarchy. Hence its value in Cromwell's eyes. Of religious conviction there is in him little trace, and still less of the religious temperament. He was a polished representative of the callous, secular middle class of that most irreligious age. Sentiment found no place, and feeling little, in his composition; he used the axe with as little passion as the surgeon does the knife, and he operated on some of the best and noblest in the land. He saw that it was wiser to proscribe a few great opponents than to fall on humbler prey; but he set law above justice, and law to him was the sovereign of kings.

In 1534 Cromwell was appointed master of the Rolls, and in 1535 chancellor of Cambridge University and visitor-general of the monasteries. The policy of the Dissolution has been theoretically denounced, but practically approved in every civilized state, Catholic as well as Protestant. Every one has found it necessary, sooner or later, to curtail or to destroy its monastic foundations; only those which delayed the task longest have generally lagged farthest behind in national progress. The need for reform was admitted by a committee of cardinals appointed by Paul III. in 1535, and it had been begun by Wolsey. Cromwell was not affected by the iniquities of the monks except as arguments for the confiscation of their property. He had boasted that he would make Henry VIII. the richest prince in Christendom; and the monasteries, with their direct dependence on the pope and their cosmopolitan organization, were obstacles to that absolute authority of the national state which was Cromwell's ideal. He had learnt how to visit monasteries under Wolsey, and the visitation of 1535 was carried out with ruthless efficiency. During the storm which followed, Henry took the management of affairs into his own hands, but Cromwell was rewarded in July 1536 by being knighted, created lord privy seal, Baron Cromwell, and vicar-general and viceregent of the king in "Spirituals."

In this last offensive capacity he sent a lay deputy to preside in Convocation, taking precedence of the bishops and archbishops, and issued his famous Injunctions of 1536 and 1538; a Bible was to be provided in every church; the Pater Noster, Creed and Ten Commandments were to be recited by the incumbent in
English; he was to preach at least once a quarter, and to start a register of births, marriages, and deaths. During these years the outlook abroad grew threatening because of the alliance, under papal guarantee, between Charles V. and Francis I.; and Cromwell sought to counterbalance it by a political and theological union between England and the Lutheran princes of Germany. The theological part of the scheme broke down in 1538 when Henry categorically refused to concede the three reforms demanded by the Lutheran envoys. This was ominous; and the parliament of 1539, into which Cromwell tried to introduce a number of personal adherents, proved thoroughly reactionary. The temporal peers were unanimous in favour of the Six Articles, the bishops were divided, and the Commons for the most part agreed with the Lords. Cromwell, however, succeeded in suspending the execution of the act, and was allowed to proceed with his one independent essay in foreign policy. The friendship between Francis and Charles was apparently getting closer; Pole was exhorting them to a crusade against a king who was worse than the Turk; and anxious eyes searched the Channel in 1539 for signs of the coming Armada. Under these circumstances Henry acquiesced in Cromwell’s negotiations, and in the summer of Cleves. Anne, of course, was not a Lutheran, and the state religion in Cleves was at least as Catholic as Henry’s own. But her sister was married to the elector of Saxony, and her brother had claims on Guelders, which Charles V. refused to recognize. Guelders was to the emperor’s dominions in the Netherlands what Scotland was to England, and had often been used by France in the same way, and an alliance between England, Guelders, Cleves and the Schmalkaldic League would, Cromwell thought, make Charles’s position in the Netherlands almost untenable. Anne herself was the weak point in the argument; Henry conceived an invincible repugnance to her from the first; he was restrained from an immediate breach with his new allies only by fear of Francis and Charles. In the spring of 1540 he was reassured on that score; no attack on him from that quarter was impending; there was a rift between the two Catholic sovereigns, and there was no real need for Anne and her German friends.

From that moment Cromwell’s fate was sealed. The Lords loathed him as an upstart even more than they had loathed Wolsey; he had no church to support him; Norfolk and Gardiner detested him from pique as well as on principle, and he had no friend in the council save Cranmer. As lay viceregent he had given umbrage to nearly every churchman, and he had put all his eggs in the one basket of royal favour, which had now failed him. Cromwell did not succumb without an effort, and a desperate struggle ensued in the council. In April the French ambassador wrote that he was tottering to his fall; a few days later he was created earl of Essex and lord great chamberlain, and two of his satellites were made secretaries to the king; he then despatched one bishop to the Tower, and threatened to send five others to join him. At last Henry struck as suddenly and remorselessly as a beast of prey; on the 20th of June Norfolk accused him of treason; the whole council joined in the attack, and Cromwell was sent to the Tower. A vast number of crimes was laid to his charge, but not submitted for trial. An act of attainder was passed against him without a dissentient voice, and after contributing his mite towards the costs of the suit, Anne, he was beheaded on Tower Hill on the 28th of July, repudiating all heresy and declaring that he died in the Catholic faith.

In estimating Cromwell’s character it must be remembered that his father was a blackguard, and that he himself spent the formative years of his life in a vile school of morals. A ruffian he doubtless was, as he says, in his youth, and he was the last man to need the tuition of Machiavelli. Nevertheless he civilized himself to a certain extent; he was not a drunken nor a forger like his father; from personal immorality he seems to have been singularly free; he was a kind master, and a stanch friend; and he possessed all the outward graces of the Renaissance period. He was not vindictive, and his atrocious acts were done in no private quarrel, but in what he conceived to be the interests of his master and the state. Where those interests were concerned he had no heart and no conscience and no religious faith; no man was more completely blighted by the 16th century worship of the state.

The authorities for the early life of Cromwell are the Wilmshurst manuscripts, used by Mr John Phillips of Putney in The Antiquary (1850), vol. ii., and Mr T. G. R. Hoare’s Apologia, i. 126; Bandello’s Novelle, xxxiv.; Chapuys’ letter to Granvelle, 21 Nov. 1535; and Foxe’s Acts and Mon. From 1522 see Letters and Papers of Henry VIII., vols. iii.-xvi.; Cavendish’s Life of Wolsey; Hall’s Chron.; Wrothiaevi’s Chron. These and practically all other available sources have been utilized in R. B. Merriman’s Life and Letters of Thomas Cromwell (2 vols., 1902). For Cromwell and Machiavelli see Paul van Dyke’s Renaissance Portraits (1906), App.

A. F. P.

Cronje, Piet Arnoldus (c. 1840–1900), Boer general, was born about 1840 in the Transvaal and in 1881 took part in the first Boer War in the rank of commandant. He commanded in the siege of the British garrison at Potchefstroom, though he was unable to force their surrender until after the conclusion of the general armistice. The Boer leader was at this time accused of withholding knowledge of this armistice from the garrison (see Potchefstroom). He was an ardent advocate of air as a body, was persuaded by the Boers to attack the Mobile Column under the command of Major-general Winterbotham, but succeeded in being caught by the Mobile Column and compelled to surrender to Lord Methuen, at the battle of Paardeberg, on 27th February (1881), and was taken to Pretoria. He was tried for treason and convicted, and was sentenced to be shot after the conclusion of peace (see Transvaal: History).

Crookes, Sir William (1832-1919), English chemist and physicist, was born in London on the 17th of June 1832, and studied chemistry at the Royal College of Chemistry under A. W. von Hofmann, whose assistant he became in 1851. Three years later he was appointed an assistant in the meteorological department of the Radcliffe observatory, Oxford, and in 1855 obtained a chemical post at Chester. In 1861, while conducting a spectroscopic examination of the residue left in the manufacture of sulphuric acid, he observed a bright green line which had not been noticed previously, and by following up the indication thus given he succeeded in isolating a new element, thallium, a specimen of which was shown in public for the first time at the exhibition of 1862. During the next eight years he carried out a minute investigation of this metal and its properties. While determining its atomic weight, he thought it desirable, for the sake of accuracy, to weigh it in a vacuum, and even in these circumstances he found that the balance behaved in an anomalous manner, the metal appearing to be heavier when cool than when hot. This phenomenon he explained as a "reputation from radiation," and he expressed his discovery in the statement that in a vessel containing a hot body and a vacuum no move away from another body hotter than itself. Utilizing this principle he constructed the radiometer (q.v.), which he was at first disposed to regard as a machine that directly transformed light into motion, but which was afterwards perceived to depend on thermal action. Thence he led to his famous researches on the phenomena produced by the discharge of electricity through highly exhausted tubes (sometimes known as "Crookes' tubes" in consequence), and to the development of his theory of "radiant matter" or matter in a "fourth state," which led up to the modern electronic theory. In 1883 he began an inquiry into the nature and constitution of the rare earths. By repeated
fractionations he was able to divide yttrium into distinct portions which gave different spectra when exposed in a high vacuum to the spark from an induction coil. This result he considered to be due not to any removal of impurities, but to an actual splitting-up of the yttrium molecule into its constituents, and he ventured to draw the provisional conclusion that the so-called simple bodies are in reality compound molecules, at the same time suggesting that all the elements have been produced by a process of evolution from one primordial stuff or "protyle." A later result of this method of investigation was the discovery of a new member of the rare earths, monium or victorium, the spectrum of which is characterized by an isolated group of lines, only to be detected photographically, high up in the ultra-violet; the existence of this body was announced in his presidential address to the British Association at Bristol in 1898. In the same address he called attention to the conditions of the world's food supply, urging that with the low yield at present realized per acre the supply of wheat would within a comparatively short time cease to be equal to the demand caused by increasing population, and that since nitrogenous manures are essential for an increase in the yield, the hope of averting starvation, as regards those races for whom wheat is a staple food, depended on the ability of the chemist to find an artificial method for fixing the waste of the earth. An analysis of precious stones, and especially the diamond, he succeeded in artificially making some minute specimens of the latter gem; and on the discovery of radium he was one of the first to take up the study of its properties, in particular inventing the spheritroscope, an instrument in which the effects of a trace of radium salt are manifested by the phosphorescence produced on a zinc sulphide screen.

In addition to many other researches besides those here mentioned, he wrote or edited various books on chemistry and chemical technology, including Select Methods of Chemical Analysis, which went through a number of editions; and he also gave a certain amount of time to the investigation of psychic phenomena, endeavouring to effect some measure of correlation between them and ordinary physical laws. He was knighted in 1897, and received the Royal (1875), Davy (1888), and Copley (1904) medals of the Royal Society, besides filling the offices of president of the Chemical Society and of the Institution of Electrical Engineers. He married Ellen, daughter of W. Humphrey, of Darlington, and their golden wedding was celebrated in 1921.

CROOKSTON, a county and the county-seat of Polk county, Minnesota, U.S.A., on the Red Lake river in the Red River valley, about 300 m. N.W. of Minneapolis, and about 25 m. E. of Grand Forks, North Dakota. Pop. (1890) 3457; (1900) 5359; (1905, state census) 6794. 2049 being foreign-born, including 656 from Norway (2 Norwegian weeklies are published), 613 from Canada, 292 from Sweden; (1910 U.S. census) 7559. Crookston is served by the Great Northern and the Northern Pacific railways. It has a Carnegie library, and the St. Vincent and Bethesda hospitals, and is the seat of a Federal Land Office and of a state agricultural high school (with an experimental farm). Dams on the Red Lake river provide a fine water-power, and among the city's manufactures are lumber, leather, flour, farm implements, wagons and bricks. The city is situated in a fertile farming region, and is a market for grain, potatoes and other agricultural products, and lumber. Crookston was settled about 1873, was incorporated in 1879, received its first city charter in 1883, and adopted a new one in 1906. It was named in honour of William Crooks, an early settler.

Kropp, to many Teutonic languages for a swelling, excrescence, round head or top of anything; it appears also in Romanic languages derived from Teutonic, in Fr. as cropppe, whence the English "cropper"; and in Ital. groppo, whence English "group"); the inglewies, or pouched expansion of a bird's esophagus, in which the food remains to undergo a preparatory process of digestion before being passed into the true stomach. From the meaning of "top" or "head," as applied to a plant, herb or flower, comes the common use of the word for the produce of cereals or other cultivated plants, the wheat-crop, the cotton-crop and the like, and generally, "the crops": more particular expressions are the "white-crop," for such grain crops as barley or wheat, which whiten as they grow ripe, and "green-crop," for such as roots or potatoes which do not, and also for those which are cut in a green state, like clover (see Agriculture). Other uses, more or less technical, of the word are, in leather-dressing, for the whole untrimmed hide; in mining and geology, for the "outcrop" or appearance at the surface of a vein or stratum and, particularly in tin mining, of the best part of the ore produced after dressing. A "hunting-crop" is a short thick stock for a whip, with a small leather loop at one end, to which a thong may be attached. From the verb "to crop," i.e. to take off the top of anything, comes "crop" meaning a closely cut head of hair, found in the name "croppy" given to the Roundheads at the time of the Great Rebellion, to the Catholics in Ireland in 1688 by the Orangemen, probably with reference to the priests' tonsures, and to the Irish rebels of 1798, who cut their hair short in imitation of the French revolutionaries.

CROPSY, Jasper Francis (1823-1900), American landscape painter, was born at Rossville, Staten Island, New York, on the 18th of February 1823. From practising architecture for a time he afterward turned his attention to painting, studying in Italy from 1847 to 1850. In 1851 he was elected a member of the National Academy of Design. From 1857 to 1863 he had a studio in London, and after his return to America enjoyed a considerable vogue, particularly as a painter of vivid autumnal effects, along the lines of the Hudson River school. He was one of the original members of the American Water Color Society. He continued actively in this profession until within a few days of his death, at Hastings-on-Hudson, New York, on the 22d of June 1900. He made the architectural designs for the stations of the elevated railways in New York City.

Croquet (from Fr. croq, a crook, or crooked stick), a lawn game played with balls, mallets, hoops and two pegs. The game has been evolved, according to some writers, from the paille-maile which was played in Languedoc at least as early as the 13th century. Under the name of le jeu de la crosse, or la crossee, a similar game was at the same period immensely popular in Normandy, and especially at Arranches, but the object appears to have been to send the ball as far as possible by driving it with the mallet (see Sports et jeux d'adresse, 1904, p. 203). Pall Mall Croquet was much played in England in the time of the Stuart, was played with a ball and a mallet, and with two hoops or a hoop and a peg, the game being won by the player who ran the hoop or hoops and touched the peg under certain conditions in the fewest strokes. Croquet certainly has some resemblance to paille-maile, played with more hoops and more balls. It is said that the game was brought to Ireland from the south of France, and was first played on Lord Lonsdale's lawn in 1854, under the auspices of the eldest daughter of Sir Edmund Macnaghten. It came to England in 1856, or perhaps a few years earlier, and soon became popular.

In 1868 the first all-comers' meeting was held at Moreton-in-Marsh. In the same year the All England Croquet Club was formed, the annual contest for the championship taking place on the grounds of this club at Wimbledon. But after being for ten years or so the most popular game for the country house and garden party, croquet was in its turn practically ousted by lawn tennis, until, with improved implements and a more scientific form of play, it was revived about 1890-95. In 1896-97 the Croquet Association, on the initiative of Mr. Walter H. Peel, under the name of the Croquet Association, was formed; on the advice of Council, the Association, with more than 2000 members and nearly a hundred affiliated clubs (1900), this body is the recognized ruling authority on croquet in the British Islands. Its headquarters are at the Roehampton Club, where the 1This was largely the work of W. T. Whitmore-Jones (1831-1872), generally known as W. Jones Whitmore, who subsequently formed the short-lived National Croquet Club, and was largely responsible for the first codification of the laws.
championship and champion cup competitions are held each year.

The Game and its Implements.—The requisites for croquet are a level grass lawn, six hoops, two posts or pegs, balls, mallets, and hoop-clips to mark the progress of the players. The usual game is played between two sides, each having two balls, the side consisting of two players in partnership, each playing one ball, or of one player playing both balls. The essential characteristic of croquet is the scientific combination between two balls in partnership against the other two. The balls are distinguished by being coloured blue, red, black and yellow, and are played in that order, blue and blue always opposing the other two.

The ground for match play measures 35 yds. by 28 yds., and should be carefully marked out with white lines. In each corner a white spot is marked 1 yd. from each boundary. The hoops are made of round iron, not less than $\frac{1}{4}$ in. and not more than $\frac{1}{4}$ in. in diameter, and standing 12 in. out of the ground. For match play they are $\frac{3}{4}$ or 4 in. across, inside measurement. They are set up as in the accompanying diagram, the numbers and arrows indicating the order and direction in which they must be passed. Each hoop is run twice, and each peg struck once. The pegs may be struck from any direction.

The pegs are $\frac{1}{4}$ in. in diameter and when fixed stand $\frac{1}{8}$ in. above the ground. The balls were formerly made of boxwood (earlier still of beechwood); composition balls are now in general use for tournaments. They must be $\frac{3}{8}$ in. in diameter and 15 oz. to 16½ oz. in weight. It will be seen that for match play the hoops are only $\frac{1}{2}$ or at the most $\frac{3}{4}$ in. wider than the diameter of the ball. The mallets may be of any size and weight, but the head must be made of wood (metal may be used only for weighting or strengthening purposes), and the ends must be parallel and similar. Only one mallet may be used in the course of a game, except in the case of bona fide damage.
